# Preface

The Survey of Health, Ageing and Retirement in Europe (SHARE) is a longitudinal household survey for the study of retirement and health among the elderly in continental Europe. It is modeled on the Health and Retirement Study (HRS) and the English Longitudinal Study of Ageing (ELSA), which are similar longitudinal surveys in the United States and England. Part of the reason for the close connection is to allow cross-country comparisons using these data.

In order to make the data more accessible to researchers and to facilitate such comparisons, we, the USC Gateway to Global Aging Data team, created the Gateway Harmonized SHARE COVID, a user-friendly version of a subset of the SHARE Corona Survey. The Gateway Harmonized SHARE COVID is part of a larger initiative to provide Harmonized COVID data for the HRS Family of Surveys. The Gateway creates and releases Harmonized COVID datasets containing easily-merged and comparable research-ready variables. The variables are defined to be as comparable as possible to the core Harmonized dataset and across all Harmonized COVID datasets. They use a similar intuitive naming convention as the core Harmonized dataset, with some modifications to avoid confusion with the core data. Harmonized COVID datasets currently include the Gateway Harmonized SHARE COVID, Harmonized HRS COVID, and Harmonized ELSA COVID, with more studies to be added in the near future. Further information about these Harmonized data files with questionnaires and other metadata is available on our searchable website, <https://covid.g2aging.org/>.

The Gateway Harmonized SHARE COVID initiative is part of a larger set of projects. With funding and support from the National Institute on Aging, we have also created the Gateway Harmonized SHARE, Gateway Harmonized SHARE End of Life, and Gateway Harmonized SHARE Life History; Harmonized HRS, Harmonized HRS End of Life, and Harmonized HRS-HCAP (United States); Harmonized MHAS, Harmonized MHAS End of Life, and Harmonized Mex-Cog (Mexico); Harmonized ELSA, Harmonized ELSA End of Life, Harmonized ELSA Life History, and Harmonized ELSA-HCAP (England); Harmonized CRELES (Costa Rica); Harmonized KLoSA and Harmonized KLoSA End of Life (South Korea); Harmonized JSTAR (Japan); Harmonized TILDA (Ireland); Harmonized CHARLS, Harmonized CHARLS End of Life, and Harmonized CHARLS Life History (China); Harmonized ELSI (Brazil); Harmonized SPS (Chile); Harmonized LASI and Harmonized LASI-DAD (India); and Harmonized MARS (Malaysia) data. Further information about the Harmonized core, life history, and HCAP data files with questionnaires and other metadata is available on our searchable website, <https://g2aging.org>. Further information about the Harmonized End of Life data files with questionnaires and other metadata is available on our searchable End of Life website, <https://eol.g2aging.org>.

Note, however, that SHARE license agreements do not allow us to disseminate the data directly. Instead, SHARE distributes the Gateway Harmonized SHARE COVID dataset in a separate download, which is made available on their website at <https://share-eric.eu/data/>. Additional information about SHARE can be obtained from SHARE's website at <https://share-eric.edu/>.

We are grateful for the continuing support of and funding from NIA. In interpreting the SHARE data, we greatly benefited from the help and insights of SHARE staff members. In particular, we thank Giuseppe De Luca, Dimitris Christelis, Giacomo Pasini, Enrica Croda, and Stefan Gruber.

## Requested Acknowledgment

We ask all users of the Gateway Harmonized SHARE COVID to please inform our team of any written analysis using data from the Gateway Harmonized SHARE COVID or information from the Gateway Harmonized SHARE COVID Codebook by sending an email to [papers@g2aging.org](mailto:papers@g2aging.org). We also ask users to include the following acknowledgement in their written work:

"This analysis uses data or information from the Gateway Harmonized SHARE COVID dataset and Codebook, Version G as of October 2024 developed by the Gateway to Global Aging Data. DOI: <https://doi.org/10.25553/t6ne-7k29>. The development of the Gateway Harmonized SHARE COVID was funded by the National Institute on Aging (R01 AG030153). For more information, please refer to <https://g2aging.org>."

## SHARE Version and Acknowledgment

This version uses data from the SHARE Corona Survey 1 and Survey 2 release 9.0.0 as of March 2024. The SHARE data collection has been funded by the European Commission through the 5th framework programme (project QLK6-CT-2001-00360 in the thematic programme Quality of Life). Further support by the European Commission through the 6th framework programme (projects SHARE-I3, RII-CT-2006-062193, as an Integrated Infrastructure Initiative, COMPARE, CIT5-CT-2005-028857, as a project in Priority 7, Citizens and Governance in a Knowledge Based Society, and SHARE-LIFE (CIT4-CT-2006-028812)), through the 7th framework programme (SHARE-PREP (No 211909), SHARE-LEAP (No 227822), M4 (No 261982)), and DASISH (No 283646); through Horizon 2020 (SHAREDEV3 (No 676536), SERISS (No 654221), SSHOC (No 823782), SHARE-COHESION (No 870628), SHARE-COVID19 (No 101015924), Ritrain (No 654156) and ERIC Forum (No 823798)), and by DG Employment, Social Affairs & Inclusion through VS 2015/0195, VS 2016/0135, VS 2018/0285, VS2019/0332, VS2020/0313, SHARE-EUCOV: GA No 101052589 and EUCOVII: GA No 101102412 is gratefully acknowledged. Substantial co-funding for add-ons such as the intensive training program for SHARE interviewers and the collection of HRS-harmonised biomarkers was granted by the US National Institute on Aging (U01 AG09740-13S2, P01 AG005842, P01 AG08291, P30 AG12815, R21 AG025169, Y1-AG-4553-01, IAG BSR06-11, OGHA 04-064, BSR12-04, and R01AG052527-02), further funding was granted for the development of a Harmonized Cognitive Assessment Protocol (HCAP) (R01 AG056329-02). Substantial funding for the central coordination of SHARE came from the German Federal Ministry for Education and Research (Bundesministerium für Bildung und Forschung, BMBF) and the Max Planck Society for the Advancement of Science. See <https://share-eric.eu/infrastructure/funding> for a full list of funding institutions.

## What's New in Version G of the Gateway Harmonized SHARE COVID?

Version G incorporates the latest released version of SHARE Corona Survey data, release 9.0.0. It contains 58,446 observations or rows. It is a Respondent-level file so each row represents a unique Respondent. It also adds new variables.

We have added the following section to the file:

### **Oxford COVID:**

- We added variables related to the governmental policies in place at the time of the interview, as well as the count of cases, deaths, and vaccination rates.

We have added the following variables to the file:

### **Demographics, Identifiers, and Weights:**

- We added **isoa3**, a character-based country identifier.

# 1. Introduction and Overview

This report documents the Gateway Harmonized SHARE COVID data file, a streamlined collection of variables derived from the Survey of Health, Ageing, and Retirement in Europe (SHARE) Corona Survey. SHARE is a cross-national panel survey of individuals over age 50 and their spouses or partners in a growing number of countries in continental Europe. Its main goal is to provide panel data that enables research and analysis in support of policies on retirement, health insurance, saving, and economic well-being. The survey elicits information about demographics, income, assets, health, cognition, family structure and connections, health care use and costs, housing, job status and history, expectations, and insurance.

SHARE is sponsored by the European Commission, national funding agencies, and the (U.S.) National Institute of Aging (NIA), is administered by national survey agencies and universities, and is coordinated by the Munich Center for the Economics of Aging (MEA). The first wave was conducted in 2004-2005. This sampled individuals born in 1954 or earlier. In addition to respondents from eligible birth years, the survey interviewed respondents' spouses or partners regardless of age.

The data include any individual interviewed at least once. This includes individuals who were age-eligible (born in eligible years) at the time of their first interview, spouses who were not age-eligible at baseline, and spouses who married an age-eligible respondent between survey waves.

SHARE uses a multistage stratified sample. Its weighting variables make its data representative of the target populations in constituent countries. The most recent release (as of March 2024) of the SHARE data is release 9.0.0. Currently, Waves 1-2 and Waves 4-9 from the core study, and Rounds 1 and 2 from the SHARE Corona Survey are available for study. SHARE Wave 3 and a large sample in Wave 7 focused on the life histories of the respondents. Because the questionnaires and variables of these SHARELIFE waves are very different from the core data, we do not include them in this document, except in specified variables. Additionally, the exit interviews from Waves 3 and 7 are used to identify respondents who exited the panel.

Documentation of the SHARE methodology can be found in Börsch-Supan et al. (2008) and Börsch-Supan and Jürges (2005). Documentation of the data can be found in SHARE (2024).

## 1.1. Gateway to Global Aging Data

The Health and Retirement Study (HRS) has achieved remarkable scientific success, as demonstrated by an impressive number of users, research studies, and publications using it. Its success has generated substantial interest in collecting similar data as population aging has progressed in every region of the world.

The result has been a number of surveys designed to be comparable with the HRS: the Mexican Health & Aging Survey (MHAS), the English Longitudinal Study of Ageing (ELSA), the Survey of Health, Ageing and Retirement in Europe (SHARE), the Costa Rican Longevity and Healthy Aging Study (CRELES), the Korean Longitudinal Study of Aging (KLoSA), the Japanese Study on Aging and Retirement (JSTAR), the Irish Longitudinal Study on Ageing (TILDA), the China Health and Retirement Longitudinal Study (CHARLS), the Brazilian Longitudinal Study of Ageing (ELSI), the Northern Ireland Cohort Longitudinal Study of Ageing (NICOLA), the Chilean Social Protection Survey (SPS), the Malaysia Ageing and Retirement Survey (MARS), and the Longitudinal Aging Study in India (LASI). The overview of this family of surveys, including their research designs, samples, and key domains can be found in Lee, Phillips, and Wilkens (2019).

As these surveys were designed with harmonization as a goal, they provide remarkable opportunities for cross-country studies. The value of comparative analyses, especially the opportunities they offer for learning lessons resulting from policies adopted elsewhere, is widely recognized. Yet there are only a limited number of empirical studies exploiting such opportunities. This is partly due to the difficulty associated with learning multiple surveys and the policies and institutions of each country.

Identifying comparable questions across surveys is the first step toward cross-country analyses. The Gateway to Global Aging Data (Gateway) helps users understand and use these large-scale population surveys on health and retirement. The Gateway includes several tools to facilitate cross-national health and retirement research. It includes a digital library of survey questions for all participating surveys. Its search engine enables users to find relevant survey questions. The Gateway also includes a concordance with information comparing measures within and across surveys over time. Using these tools, researchers can identify all questions related to particular key words or within a domain. The Gateway also includes population and sub-population estimates for key harmonized variables and presents them in graphs and tables that can be downloaded.

The Gateway to Global Aging COVID Data can be accessed at <https://covid.g2aging.org>. The Gateway to Global Aging Data, with information on core interviews, can be accessed at <https://g2aging.org>. For more information about using the Gateway, visit the Help page. For more information about obtaining the Gateway Harmonized SHARE COVID, see “Chapter 3. Distribution and Technical Notes.”

## 1.2. Units of Observation

We distinguish between three units of observation: individual, couple, and household. A "couple" in this sense means "single individual, or individual with his/her spouse, whatever applicable". In the first wave of SHARE, once it was determined that there was an age-eligible member of the household, all age-eligible household members and their spouses or partners were eligible for interviewing, regardless of their age. As a result, there are households in the

data in which more than one “couple” is interviewed, for example, a husband and wife who were older than 50 and the mother of one of them.

In the HRS, an age-eligible individual is sampled and then this individual and their spouse or partner is interviewed, but no other household members, even if they are age-eligible. Thus, in the HRS, there is usually no distinction between a “couple” and a “household”. More precisely, “household” variables in the HRS (and the RAND HRS) are actually “couple” variables. But, as mentioned above, in SHARE, a household may consist of more than one “couple”.

In the second wave of SHARE, the refreshment sample was collected in the same way as the HRS, so there are no interviewed household members outside the one age-eligible respondent and their spouse or partner, regardless of their age. However, Wave 1 respondents were still eligible for re-interview in Wave 2, so in Wave 2, we still see households with more than one “couple”. Since the fourth wave of SHARE, all waves are similar to the second wave in that only one age-eligible respondent and their spouse or partner in the refreshment sample are interviewed and in the longitudinal sample, all previous respondents are interviewed along with their spouses or partners, regardless of their age.

SHARE provides a limited amount of information about household members who are not interviewed. The *coverscreen respondent* reports a complete household roster and for each household member, age, sex, marital or partner status, and identity of the spouse or partner are recorded. Only individuals over 50 and their spouses or partners are selected for a subsequent interview. In our files, we do not include non-respondents, and thus, in particular, we do not include the information about household members who were not eligible to be interviewed.

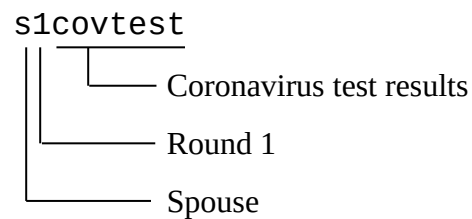

### 1.3. Data File Structure

The Gateway Harmonized SHARE COVID data are contained in a single file, which includes the first and second rounds of the SHARE Corona Survey. The data are stored in a “fat format” where each observation represents one respondent. The unit of observation is the individual. Each individual is uniquely identified by the unique identifier **mergeid**. Households are identified by round-specific **hhRchhid**, where ‘R’ refers to the specific round. Couples are identified by round-specific **hRccoupid**, where ‘R’ refers to the specific round. It is important to note that unlike the RAND HRS, households in SHARE can include multiple couples. This file may be merged with other SHARE data using **mergeid**.

### 1.4. Variable Naming Convention

With few exceptions, variable names in the Gateway Harmonized SHARE COVID data follow a consistent pattern. The first character indicates whether the variable refers to the reference person (“R”), spouse (“S”), or the couple (“H”), or the household (“HH”). The second character indicates the round to which the variable pertains: “1”, “2”, or “A”. The “A” indicates “all”, i.e., the variable is not specific to any single wave. An example is **ragender**, the gender of the

respondent. The remaining characters describe the concept that the variable captures. For example:

Variable **s1covtest** captures the coronavirus test results of the spouse of the reference person as of Round 1. The name of the variable does not indicate who provided the information. For example, the spouse's coronavirus test results may have been reported by the spouse themselves, or it may have been reported by the reference person as a proxy.

Variable labels also follow a consistent pattern. The first characters denote the name of the variable, followed by a colon. Then follows the round to which the variable pertains (r1). The remainder of the label describes the concept that the variable captures. For example, the variable label of **s1covtest** is:

```
s1covtest:r1 covid: s coronavirus test results
```

It may seem duplicative to include the name of the variable in the variable label. However, statistical packages often suppress the variable name and instead use its label in the presentation of results.

Variable names in the Gateway Harmonized SHARE COVID are generally based on the variable name used in the Harmonized HRS COVID for the same measure or in the Gateway Harmonized SHARE for a similar measure. Measures which are exactly or near-exactly comparable between the Gateway Harmonized SHARE COVID and Harmonized HRS COVID use the exact same name. For instance, **ragender** is the variable name for the respondent's gender in both the Gateway Harmonized SHARE COVID and Harmonized HRS COVID. If the Gateway Harmonized SHARE COVID measure is deemed only somewhat comparable with the Harmonized HRS COVID version of that measure, the variable name in the Gateway Harmonized SHARE COVID will often end in "\_s." This variable name suffix indicates some SHARE-specific difference with the Harmonized HRS COVID version of this measure. For instance, the Gateway Harmonized SHARE COVID variable for the frequency the respondent wore a face mask whenever they went outside is named **rRcmaskf\_s** while the Harmonized HRS COVID for the frequency the respondent wore a face mask around other people outside their home is named **rRcmaskf**. The reason for this difference in variable name is that SHARE COVID utilizes a different response scale than the HRS COVID. Other reasons for Gateway Harmonized SHARE COVID-specific variable names include: differences in question wording and survey routing, and whether both sets of variables use imputed values. Gateway Harmonized SHARE COVID-specific variable

names are used to notify the user that there are substantial differences between the Harmonized HRS COVID and Gateway Harmonized SHARE COVID measures and clean harmonization between these measures is not possible.

The Gateway Harmonized SHARE COVID includes some variables without Gateway Harmonized SHARE COVID-specific variable names even though the Gateway Harmonized SHARE COVID measure is significantly different from the Harmonized HRS COVID measure of the same name. In particular, economic variables in the Gateway Harmonized SHARE COVID do not use Gateway Harmonized SHARE COVID-specific variable names even though economic measures in the Gateway Harmonized SHARE COVID are expressed in nominal Euros while economic measures in the Harmonized HRS COVID are always expressed in nominal dollars. Users should always check the “Differences with the Harmonized HRS COVID” section of each measure before comparing any Gateway Harmonized SHARE COVID measure to the Harmonized HRS COVID version of the same measures or any other Harmonized Dataset version of the same measure.

## 1.5. Missing Values, Nonresponse, and Imputations

Variables may contain missing values for several reasons. Stata, SAS, and SPSS offer the capability to distinguish multiple types of missing values, and we have attempted to record as much information as possible. Generally, the codes adhere to the classification in Table 1.

**Table 1. Missing Codes**

| Code | Reason for missing                                     |
|------|--------------------------------------------------------|
| .d   | Don't know                                             |
| .m   | Other missing                                          |
| .r   | Refused                                                |
| .u   | Reference person is not married (for spouse variables) |
| .v   | Spouse did not respond to wave (for spouse variables)  |

The coding scheme varies across variables. Consult the Data Codebook for details on individual variables.

Item nonresponse for many variables is handled by imputation. In the SHARE Corona Survey, the hot-deck imputations technique and the Fully Conditional Specification (FCS) method are used. A more detailed description is provided in the SHARE Corona Survey Release Guide 9.0.0 (2024). These techniques are different from the ones used in the SHARE core surveys. For more information on the multiple imputations technique used in the core surveys, please see SHARE (2010, pp. 28-29) and Christelis (2011).

## 1.6. Weighting and Accounting for Survey Design

The Gateway Harmonized SHARE COVID includes weighting variables that have been created and released by SHARE to account for non-response. Calibrated cross-sectional weights at the

individual level and at the household level are provided for both rounds. Because Round 1 of the SHARE Corona Survey was fielded just after Wave 8 of the SHARE core survey, there are panel members who were interviewed in both Wave 8 and Round 1 of the SHARE Corona Survey. As a result, weights at the individual level and at the household level for Round 1 are calculated for two different subsamples of respondents: 1) the subsample of panel members who had not been interviewed in Wave 8 and only interviewed for Round 1 of the SHARE Corona Survey and 2) the subsample of panel members who had been interviewed for both Wave 8 and Round 1 of the SHARE Corona Survey. More information about weighting can be found in the SHARE Corona Survey Release Guide 9.0.0 (2024).

## 1.7. Specifics to the COVID-19 Interview

SHARE was in the middle of data collection for Wave 8 in 2020 when the coronavirus pandemic started and fieldwork had to be suspended. At that point, about 70 percent of the sample had been interviewed face-to-face. To resume fieldwork, SHARE developed the SHARE Corona Survey and switched to telephone administered interviews (CATI). This survey covered some of the same topics as the core SHARE questionnaire but was considerably shorter and elicited information about panel members' health and health behaviours, mental health, infections and healthcare, changes in work and economic situation, and social networks.

Round 1 of the SHARE Corona Survey was fielded to panel members who had not been interviewed in Wave 8 before fieldwork was suspended and to panel members who had already been interviewed in Wave 8. The same questionnaire was fielded to all respondents, but questions on changes in household composition (the Coverscreen) in the SHARE Corona Survey were only asked to those who had not been interviewed in Wave 8 prior to fieldwork suspension. Round 1 of the SHARE Corona Survey was fielded in 27 countries from June to August 2020 and fielded in Austria from July to September 2020. Round 2 of the SHARE Corona Survey was fielded in the same 28 countries as Round 1 from June to August 2021.

## 1.8. Oxford COVID Government Response Tracker (OxCGRT)

The Oxford COVID-19 Government Response Tracker ([OxCGRT](#)) started in March 2020 to track and collect information on government-enacted policy measures that were taken to combat COVID-19. Daily policy changes were tracked from January 1, 2020 to December 31, 2022, and through the end of February 2023 for China. National data was collected for 185 countries and sub-national data was collected for Australia, Brazil, Canada, China, India, the United Kingdom, and the United States. It reports the most stringent government policy in place, which was designed to have the highest ordinal value.

A total of 24 policy indicators were collected.

- Containment and closure policies: (C1) school closing, (C2) workplace closing, (C3) cancel public events, (C4) restrictions on gatherings, (C5) close public transport, (C6) stay at home requirements, (C7) restrictions on internal movement, (C8) international travel controls

- Economic policies: (E1) income support, (E2) debt/contract relief, (E3) fiscal measures, (E4) international support
- Health system policies: (H1) public information campaigns, (H2) testing policy, (H3) contact tracing, (H4) emergency investment in healthcare, (H5) investment in vaccines, (H6) facial coverings, (H7) vaccination policy, (H8) protection of elderly people
- Vaccination policies: (V1) vaccination prioritization, (V2a-g) vaccine eligibility/availability, (V3) vaccine financial support, (V4) vaccine requirement/mandate

Ten of the policy indicators differentiate policies by vaccination status: C1-C8, H6, and H8. For these policies, four versions of data are provided. If the same policy applies to everyone regardless of vaccination status, then the everyone version will have values. If policies differ by vaccination status, then the vaccinated and non-vaccinated versions will have values. If the everyone version has values, then the vaccinated and non-vaccinated versions will not have values, and vice-versa. Finally, the majority version of the variable will always have values and indicate either the policy that applies to everyone or to the majority of people depending on the vaccination rate of the country.

The cumulative number of reported COVID-19 cases and deaths attributed to COVID-19 since the beginning of the pandemic are provided, as is the percentage of the fully vaccinated population in the jurisdiction.

OxCGRT also provides four indices. The government response index summarizes the following policies: C1-C8, E1-E2, H1-H3, and H6-H8. The containment and health index summarizes the following policies: C1-C8, H1-H3, and H6-H8. The stringency index summarizes the following policies: C1-C8, and H1. The economic support index summarizes the E1 and E2 policies.

Because these indices use ordinal indicators with different scales, a sub-index score that normalizes each of the indicators first created. Additionally, C1-C7, E1, H1, and H7-H8 have an additional binary flag variable that is taken into account. Each sub-index score for any given indicator on any given day is calculated using the maximum value of the indicator and the recorded policy value, the presence of a flag variable and the recorded flag value. This produces a normalized sub-index score between 0 and 100. In the subsequent calculation of the index values, each individual component indicator is given equal weight using a simple average. For more information on the calculation of the index values, please see

[https://github.com/OxCGRT/covid-policy-dataset/blob/main/documentation\\_and\\_codebook.md#calculation-of-policy-indices](https://github.com/OxCGRT/covid-policy-dataset/blob/main/documentation_and_codebook.md#calculation-of-policy-indices).

For each index, OxCGRT provides four versions with different treatments of vaccine-differentiated policies: (1) Nonvax - constructs the index using “non-vaccinated” policies if present, or otherwise uses “everyone” policies, (2) Vax - constructs the index using vaccinated policies if present, or otherwise using everyone policies, (3) Simple average – takes the sum of “nonvax” and “vax” indices and divides them by 2, (4) Weighted average – takes an average of the “nonvax” and “vax” indices weighted by the proportion of the population that is vaccinated.

## 1.9. Merging the COVID Data with Core Wave Data

The Gateway Harmonized SHARE COVID dataset can be easily merged with SHARE study data or the Gateway Harmonized SHARE by using the unique SHARE ID variable, **mergeid**. Here, we provide an example of Stata code to correctly merge the Gateway Harmonized SHARE dataset with the Gateway Harmonized SHARE COVID dataset.

```
use "filepath\GH_SHARE_COVID_g.dta"
```

```
merge 1:1 mergeid using "filepath\GH_SHARE_g.dta"
```

Here, we provide an example of Stata code to correctly merge select variables from the Gateway Harmonized SHARE dataset with select variables from the Gateway Harmonized SHARE COVID dataset.

```
use variable1 variable2 variable3 using "filepath\GH_SHARE_COVID_g.dta"
```

```
merge 1:1 mergeid using "filepath\GH_SHARE_g.dta", keepusing(variable4  
variable5 variable6)
```

In both cases, the same method can be used to merge most of the original SHARE study data if the name of the dataset is changed.

## 2. Structure of Codebook

The Data Codebook contains the codebook documenting all variables in the Gateway Harmonized SHARE COVID data. This section explains how to interpret the codebook entries. The figure below shows a typical codebook page; the numbers in circles correspond to comments below.

| Others Died from COVID-19      |               |                                                           |         |         | 1       |
|--------------------------------|---------------|-----------------------------------------------------------|---------|---------|---------|
| Round                          | Variable      | Label                                                     | 4       | Type    |         |
| 2                              | 1 R10COVDIED  | r10covdied:r1 COVID: r anyone close died from COVID       |         | Categ   |         |

7

**How Constructed**

At Round 1, respondents are asked whether anyone close to them has died from COVID-19. At Round 2, respondents are asked whether anyone close to them has died from COVID-19 since their last interview (since July 2020). In both rounds, if the respondent reported that someone close to them died from COVID-19, the respondent is then asked to identify their relationship with the person who died. Such relationships include the respondent's spouse or partner, parent, child, other household member, other relative outside of household, neighbor, friend, or colleague, caregiver, or other.

RrOCOVDIED indicates whether the respondent knows anyone who has died from COVID-19. RrOCOVDIED is coded as 0 if the respondent reports that nobody close to them has died from COVID-19. RrOCOVDIED is coded as 1 if the respondent reports that someone close to them has died from COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrOCOVDIED is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrOCOVFDIED is a flag variable that indicates whether responses to RrOCOVDIED are imputed by SHARE. RrOCOVFDIED is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrOCOVFDIED is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrOCOVDIEDE indicates whether the respondent knows anyone close to them has ever died from COVID-19. RrOCOVDIEDE is only available at Round 2. Previous reports from Round 1 are fed forward to derive R20COVDIEDE. RrOCOVDIEDE is coded as 0 if the respondent reports that nobody close to them has ever died from COVID-19. RrOCOVDIEDE is coded as 1 if the respondent reports that someone close to them has ever died from COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrOCOVDIEDE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrOCOVDIED indicates whether the respondent's spouse knows anyone who has died from COVID-19. SrOCOVFDIED is a flag variable that indicates whether responses to SrOCOVDIED are imputed by SHARE. SrOCOVDIEDE indicates whether the respondent's spouse knows anyone close to them has ever died from COVID-19. SrOCOVDIED, SrOCOVFDIEDE, and SrOCOVDIEDE are taken from the spouse's values to RrOCOVDIED, RrOCOVFDIEDE, and RrOCOVDIEDE, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

8

**Cross Round Differences in SHARE**

At Round 1, respondents are asked to report if anyone close to them has died due to an infection from COVID-19, while at Round 2, respondents are asked if anyone close to them has died due to an infection from COVID-19 since their last interview (since July 2020).

For comparability across studies and rounds, two variables are derived: RrOCOVDIED, which indicates whether the respondent knows anyone who has died from COVID-19, and RrOCOVDIEDE, which indicates whether the respondent knows anyone close to them has ever died from COVID-19. RrOCOVDIED is available at both rounds and RrOCOVDIEDE is only available at Round 2, with previous reports from Round 1 fed forward to derive R20COVDIEDE.

RrOCOVFDIEDE is only available at Round 1 because Round 2 does not provide imputed values as part of its public release.

## 9 → Differences with the Harmonized HRS COVID

The HRS COVID asks questions about deaths due to COVID-19 without a time reference at both rounds. Due to the greater length of the implied timeframe since the start of the pandemic in Round 2, the Harmonized HRS COVID includes R10COVDIED and R20COVDIEDE. The SHARE Corona Survey asks questions about deaths due to COVID-19 without a specific timeframe but implying since the start of the pandemic in Round 1 and since their previous interview in Round 2. As a result of these more concrete timeframes, the Gateway Harmonized SHARE COVID includes R10COVDIED, R20COVDIED, and R20COVDIEDE.

The HRS COVID does not provide imputed values as part of its public release.

## 10 → Comparability with the Gateway Harmonized SHARE.

No comparable variables are available in the Gateway Harmonized SHARE.

## 11 → SHARE Variables Used:

|                   |                                                        |

- 1 **Title:** The variables are documented in groups according to the concept that they measure. The title is often followed by a short description of the concept that is captured.
- 2 **Variable Names:** This entry shows the names of variables in the group.
- 3 **Variable Labels:** This entry shows the Stata variable labels. As discussed above, the labels typically include the name of the variable, the file on which it is present, and a description of its contents.

- 4 *Variable Type*: This entry indicates the type of variable. It may be continuous (Cont), categorical (Categ), or character (Char).
- 5 *Descriptive Statistics*: This entry shows descriptive statistics on each variable. They include the number of nonmissing values, the mean, standard deviation, minimum value, and maximum value.
- 6 *Categorical Value Codes*: This entry shows the value label codes. These are only relevant for categorical variables. The first character(s) of the value labels indicate the value to which each label has been assigned. For example, value “1” is mapped into “1.Yes” (not just “Yes”). The entry also indicates which labels are assigned to which variables and shows frequency tabulations of all categorical variables.
- 7 *How Constructed*: This entry provides background on the manner in which variables were constructed.
- 8 *Cross Round Differences in SHARE*: This entry briefly describes differences in question wording or contents between interview rounds.
- 9 *Differences with the Harmonized HRS COVID*: This entry describes any differences between the Harmonized HRS COVID version of the variable and the Gateway Harmonized SHARE COVID version of the variable. It is imperative these differences are understood when using harmonized measures.
- 10 *Comparability with the Gateway Harmonized SHARE*: This entry describes whether the Gateway Harmonized SHARE includes a variable that is comparable to the Gateway Harmonized SHARE COVID version of the variable.
- 11 *SHARE Variables Used*: This entry provides the names and labels of raw SHARE variables that were used to construct the new variables.

### 3. Distribution and Technical Notes

The Gateway Harmonized SHARE COVID data file is distributed through the SHARE website along with the original SHARE data. The Gateway Harmonized SHARE COVID data file is made available free of charge but only to users who register with the SHARE and agree to the standard conditions. For more information on obtaining access to the SHARE data, visit: <https://share-eric.eu/data/data-access>.

The Gateway Harmonized SHARE COVID is distributed in Stata, SPSS, and R dataset formats.

This is version **G** of the Gateway Harmonized SHARE COVID Data.

A copy of this Gateway Harmonized SHARE COVID Codebook can be obtained on the Gateway to Global Aging Data (<https://covid.g2aging.org>) under the Downloads tab.

DOI: <https://doi.org/10.25553/t6ne-7k29>

4. Data Codebook

**Section A: Demographics**

|                                   |
|-----------------------------------|
| <b>Person Specific Identifier</b> |
|-----------------------------------|

| Round | Variable | Label                                     | Type |
|-------|----------|-------------------------------------------|------|
| A     | HHID     | hhid: household id / 6-char               | Char |
| A     | PN       | pn: Person number within household (char) | Char |
| A     | MERGEID  | mergeid: cid - hhidc - pn /12-char        | Char |

**How Constructed:**

SHARE provides a unique identifier for each respondent, MERGEID. It consists of three separate parts:

CID is a 2-character country/language survey code derived from the first part of MERGEID. CID is different from COUNTRY because three countries (Switzerland, Belgium, and Israel) use a different CID for the different survey languages used within the country. CID takes the following values: 11.Austria, 12.Germany, 13.Sweden, 14.Netherlands, 15.Spain, 16.Italy, 17.France, 18.Denmark, 19.Greece, 20.Switzerland (German), 21.Switzerland (French), 22.Switzerland (Italian), 23.Belgium (French), 24.Belgium (Flemish), 25.Israel (Hebrew), 26.Israel (Arabic), 27.Israel (Russian), 28.Czech Republic, 29.Poland, 31.Luxembourg, 32.Hungary, 33.Portugal, 34.Slovenia, 35.Estonia, 47.Croatia, 48.Lithuania, 51.Bulgaria, 53.Cyprus, 55.Finland, 57.Latvia, 59.Malta, 61.Romania, and 63.Slovakia.

HHID is a 6-character household identifier used in SHARE to indicate the household to which a sample participant belonged when entering the panel. Please note that HHID is different from SHARE's round-specific household identifier CHHIDr, which indicates the household where the respondent resides in a particular round r.

PN is the 2-character respondent identifier used by SHARE to indicate each participant within the household.

MERGEID is SHARE's 12-character unique and non-changing identifier across rounds. MERGEID is formed as CID-HHID-PN. For example, if a respondent is from Austria and has a CID of 11, is in a household with HHID 123456, and has a PN of 02 inside the household, then their MERGEID would be "11-123456-02".

MERGEID is used for all merges between rounds since it is the only identifier that tracks respondents across rounds. MERGEID is a SHARE-specific identifier and can be used for merging additional information from the SHARE core surveys and the Gateway Harmonized SHARE.

**Cross Round Differences in SHARE**

No differences known.

**Differences with the Harmonized HRS COVID**

No differences known.

**Comparability with the Gateway Harmonized SHARE**

CID: This variable is comparable to CID in the Gateway Harmonized SHARE.

HHID: This variable is comparable to HHID in the Gateway Harmonized SHARE.

PN: This variable is comparable to PN in the Gateway Harmonized SHARE.

MERGEID: This variable is comparable to MERGEID in the Gateway Harmonized SHARE.

**SHARE Variables Used:**

|                   |                                                  |
|-------------------|--------------------------------------------------|
| Round 1 Covid-19: |                                                  |
| MERGEID           | Person identifier (fix across modules and waves) |
| Round 2 Covid-19: |                                                  |
| MERGEID           | Person identifier (fix across modules and waves) |

| Household Identifier |           |                                                           |  |      |
|----------------------|-----------|-----------------------------------------------------------|--|------|
| Round                | Variable  | Label                                                     |  | Type |
| 1                    | HH1CHHID  | hh1chhid:r1 COVID: cid + hhold id + subhousehold /Num     |  | Cont |
| 2                    | HH2CHHID  | hh2chhid:r2 COVID: cid + hhold id + subhousehold /Num     |  | Cont |
| 1                    | HH1CHHIDC | hh1chhidc:r1 COVID: cid + hhold id + subhousehold /9-char |  | Char |
| 2                    | HH2CHHIDC | hh2chhidc:r2 COVID: cid + hhold id + subhousehold /9-char |  | Char |
| 1                    | CHHID1    | chhid1:r1 COVID: round specific household identifier      |  | Char |
| 2                    | CHHID2    | chhid2:r2 COVID: round specific household identifier      |  | Char |

Descriptive Statistics

| Variable | N     | Mean         | Std Dev      | Minimum      | Maximum      |
|----------|-------|--------------|--------------|--------------|--------------|
| HH1CHHID | 57547 | 293281381.52 | 146537342.95 | 110012151.00 | 639960041.00 |
| HH2CHHID | 49263 | 297961029.55 | 147383740.75 | 110014921.00 | 639960041.00 |

How Constructed:

HHrCHHID is a numeric version of the household identifier used by the SHARE Corona Survey. HHrCHHID uniquely identifies a household in a given COVID round. HHrCHHID consists of CID + HHID + a subhousehold identifier. Subhouseholds in SHARE identify split households, that is, those households formed by panel members who moved out of a previous household. SHARE specifically codes subhouseholds using letters, with "A" given to original households and subsequent letters to split households. To create a numeric version of the household identifier, subhouseholds are coded according to their alphabetical positions, e.g. A=1, B=2, etc. Thus, if a respondent is from Austria and has a CID of 11, is in a household with HHID 123456 in the first COVID round, and is in subhousehold A, then their HH1CHHID would be "111234561".

HHrCHHIDC is a 9-digit character version of HHrCHHID. HHrCHHIDC is created using exactly the same standards as HHrCHHID, but is stored as a character.

CHHIDr is the SHARE household identifier. CHHIDr is an 11-character variable consisting of CID-HHID-a subhousehold identifier. For example, if a respondent is from Austria and has a CID of 11, is in a household with HHID 123456 and is in subhousehold A in the first round, then their CHHID1 would be "11-123456-A".

Please note that Round 1 was conducted during Wave 8 of the SHARE main survey, so CHHID1 is taken directly from HHID8, the Wave 8 SHARE household identifier.

HHrCHHID, HHrCHHIDC, and CHHIDr may change across COVID rounds, hence none of these variables should be used to merge different rounds of data. CHHIDr is a SHARE-specific variable and can be used for merging additional round-specific data from SHARE.

Cross Round Differences in SHARE

Round 1 was conducted during Wave 8 of the SHARE main survey, so CHHID1 is taken directly from HHID8, the Wave 8 SHARE household identifier.

Differences with the Harmonized HRS COVID

No differences known.

Comparability with the Gateway Harmonized SHARE

HHrCHHID: This variable is comparable to HHwHHID in the Gateway Harmonized SHARE.

HHrCHHIDC: This variable is comparable to HHwHHIDC in the Gateway Harmonized SHARE.

CHHIDr: This variable is related to HHIDw, which is the SHARE household identifier for each wave, in the Gateway Harmonized SHARE.

**SHARE Variables Used:**

|                   |                                                  |
|-------------------|--------------------------------------------------|
| Round 1 Covid-19: |                                                  |
| HHID8             | Household identifier (wave 8)                    |
| MERGEID           | Person identifier (fix across modules and waves) |
| Round 2 Covid-19: |                                                  |
| HHID9CA           | Household identifier (wave 9: COVID-19 Survey 2) |
| MERGEID           | Person identifier (fix across modules and waves) |

Couple Identifier

| Round | Variable  | Label                                                    | Type |
|-------|-----------|----------------------------------------------------------|------|
| 1     | H1CCOUPID | h1ccoupid:r1 COVID: round specific couple id number /num | Cont |
| 2     | H2CCOUPID | h2ccoupid:r2 COVID: round specific couple id number /num | Cont |

Descriptive Statistics

| Variable  | N     | Mean     | Std Dev  | Minimum | Maximum  |
|-----------|-------|----------|----------|---------|----------|
| H1CCOUPID | 57547 | 19902.52 | 11256.50 | 1.00    | 39189.00 |
| H2CCOUPID | 49263 | 16912.98 | 9575.18  | 1.00    | 33285.00 |

How Constructed:

HrCCOUPID is a numeric variable that identifies couples in a given round.

Every respondent to a given round is assigned a couple ID. SHARE assigns each individual in the household a coverscreen ID and records the coverscreen ID of their spouse. Couples are determined by matching the coverscreen IDs of partnered individuals in the same household. HrCCOUPID is set to plain missing (.) if the respondent did not respond to the particular round.

Please note that Round 1 was conducted during Wave 8 of the SHARE main survey, so H1CCOUPID is derived from MERGEIDP8, the person identifier for Wave 8, and HHID8, the Wave 8 SHARE household identifier.

HrCCOUPID is used to identify all spouse data, but is not an unique identifier across rounds. It should not be used for merging.

Cross Round Differences in SHARE

Round 1 was conducted during Wave 8 of the SHARE main survey, so H1CCOUPID is derived from MERGEIDP8, the person identifier for Wave 8, and HHID8, the Wave 8 SHARE household identifier.

Differences with the Harmonized HRS COVID

The HRS COVID does not derive couple identifiers.

Comparability with the Gateway Harmonized SHARE

HrCCOUPID: This variable is comparable to HwCOUPID in the Gateway Harmonized SHARE.

SHARE Variables Used:

|                           |                                                  |
|---------------------------|--------------------------------------------------|
| Gateway Harmonized SHARE: |                                                  |
| HHID8                     | hhid8: SHARE household identifier wave 8         |
| MERGEIDP8                 | Partner identifier (wave 8)                      |
| Round 1 Covid-19:         |                                                  |
| MERGEID                   | Person identifier (fix across modules and waves) |
| Round 2 Covid-19:         |                                                  |
| HHID9CA                   | Household identifier (wave 9: COVID-19 Survey 2) |
| MERGEID                   | Person identifier (fix across modules and waves) |
| MERGEIDP9CA               | Partner identifier (wave 9: COVID-19 Survey 2)   |

Spouse Identifier

| Round | Variable   | Label                                        | Type |
|-------|------------|----------------------------------------------|------|
| 1     | S1CMERGEID | s1cmergeid:r1 COVID: spouse mergeid /12-char | Char |
| 2     | S2CMERGEID | s2cmergeid:r2 COVID: spouse mergeid /12-char | Char |

How Constructed:

SrCMERGEID is the MERGEID of the respondent's spouse at the current COVID round as identified by HrCCOUPID. SrCMERGEID is coded as 0 if the respondent participated in the current round, but their spouse did not participate. SrCMERGEID is coded as plain missing (.) if the respondent did not participate in the current COVID round.

Because HrCCOUPID does not directly correspond to marriage status, there are a number of individuals who are counted as a couple even though one or both individuals report themselves as being unmarried. These cases of unmarried but coupled individuals can best be thought of as cohabiting partners who are also counted as spouses in the Gateway Harmonized SHARE.

Following the Gateway Harmonized SHARE, the Gateway Harmonized SHARE COVID contains spouse versions of many variables. Spouse variables are generated for the spouse in each round as identified by HrCCOUPID. If the spouse variables are missing because the respondent is single, they are set to a special missing value (.u). If they are missing because the respondent's spouse was not present for the interview, they are set to a special missing value (.v).

Cross Round Differences in SHARE

No differences known.

Differences with the Harmonized HRS COVID

No differences known.

Comparability with the Gateway Harmonized SHARE

SrCMERGEID: This variable is comparable to SwMERGEID in the Gateway Harmonized SHARE.

SHARE Variables Used:

|                           |                                                  |
|---------------------------|--------------------------------------------------|
| Gateway Harmonized SHARE: |                                                  |

| Round 1 Covid-19:         |                                                  |
| MERGEID                   | Person identifier (fix across modules and waves) |
| Round 2 Covid-19:         |                                                  |
| HHID9CA                   | Household identifier (wave 9: COVID-19 Survey 2) |
| MERGEID                   | Person identifier (fix across modules and waves) |
| MERGEIDP9CA               | Partner identifier (wave 9: COVID-19 Survey 2)   |

Round Status: Response Indicator

| Round | Variable | Label                  | Type  |
|-------|----------|------------------------|-------|
| 1     | INCR1    | incr1:In COVID round 1 | Categ |
| 2     | INCR2    | incr2:In COVID round 2 | Categ |

Descriptive Statistics

| Variable | N     | Mean | Std Dev | Minimum | Maximum |
|----------|-------|------|---------|---------|---------|
| INCR1    | 58446 | 0.98 | 0.12    | 0.00    | 1.00    |
| INCR2    | 58446 | 0.84 | 0.36    | 0.00    | 1.00    |

Categorical Variable Codes

| Value----- | INCR1 | INCR2 |
|------------|-------|-------|
| 0.No       | 899   | 9183  |
| 1.Yes      | 57547 | 49263 |

How Constructed:

INCRr indicates whether the respondent participated in the current COVID round. INCRr is coded as 0 if the respondent did not participate in the round. INCRr is coded as 1 if the respondent participated in the round.

Cross Round Differences in SHARE

No differences known.

Differences with the Harmonized HRS COVID

No differences known.

Comparability with the Gateway Harmonized SHARE

INCRr: This variable is comparable to INWw in the Gateway Harmonized SHARE.

SHARE Variables Used:

|                   |                                                  |
|-------------------|--------------------------------------------------|

| Round 2 Covid-19: |                                                  |
| MERGEID           | Person identifier (fix across modules and waves) |

Sampling Design: Response Indicator

| Round | Variable    | Label                                     | Type |
|-------|-------------|-------------------------------------------|------|
| 1     | R1COVWTSAMP | r1covwtsamp:r1 COVID: design weight       | Cont |
| 2     | R2COVWTSAMP | r2covwtsamp:r2 COVID: design weight       | Cont |
| A     | RAPSU1      | rapasu1: primary sampling unit            | Char |
| A     | RAPSU2      | rapasu2: secondary sampling unit          | Char |
| A     | RAESTRAT1   | raestrat1: first stratification variable  | Char |
| A     | RAESTRAT2   | raestrat2: second stratification variable | Char |

Descriptive Statistics

| Variable    | N     | Mean   | Std Dev | Minimum | Maximum  |
|-------------|-------|--------|---------|---------|----------|
| R1COVWTSAMP | 57538 | 735.12 | 1809.06 | 8.12    | 47758.23 |
| R2COVWTSAMP | 49254 | 823.67 | 1835.43 | 8.12    | 47758.23 |

How Constructed:

RrCOVWTSAMP indicates the respondent's design weight. RrCOVWTSAMP is taken directly from the sampling design weights provided by SHARE at each round. Because the inclusion probability of any eligible household member is the same as the inclusion probability of the whole household, this weight accounts for both the individual and household. This weight is defined as the inverse of the probability of being included in the sample at each round, allowing users to compensate for unequal selection probabilities of the sample units.

Please note that the first COVID round was conducted during Wave 8 of the SHARE main survey, so R1COVWTSAMP is taken directly from dw\_w8, the Wave 8 sampling design weight.

RAPSU1 indicates the respondent's primary sampling unit. RAPSU2 indicates the respondent's secondary sampling unit. RAPSU1 and RAPSU2 are taken directly from the primary and secondary sampling units provided by SHARE. The first non-missing primary and secondary sampling units were always used.

RAPSU1 values are not provided for the respondents in Cyprus, Denmark, Estonia, Ireland, Luxembourg, Malta, and Switzerland. RAPSU1 values are missing for much of the sample in France, Greece, Poland, and Sweden.

RAPSU2 values are not provided for the respondents in Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Ireland, Israel, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Romania, Slovakia, Slovenia, Sweden, or Switzerland. RAPSU2 values are provided for Hungary, Italy, Portugal and Spain, but are missing for a majority of the respondents in Hungary and Spain.

RAESTRAT1 indicates the respondent's first stratification variable. RAESTRAT2 indicates the respondent's second stratification variable. RAESTRAT1 and RAESTRAT2 are taken directly from the primary and secondary stratum provided by SHARE. Across all core wave and COVID rounds of SHARE, the first non-missing primary and secondary stratum were always used.

RAESTRAT1 values are not provided for the respondents in Denmark, Germany, Ireland, or Netherlands. RAESTRAT1 values are missing for a majority of the respondents in France, Portugal, and Sweden.

RAESTRAT2 values are not provided for the respondents in Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Ireland, Israel, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Portugal, Spain, or Sweden. RAESTRAT2 values are provided for Hungary,

Italy, Poland, Romania, Slovakia, Slovenia, and Switzerland, but are missing for a majority of the respondents in Poland and Switzerland.

**Cross Round Differences in SHARE**

The first COVID round was conducted during Wave 8 of the SHARE main survey, so R1COVWTSAMP is taken directly from dw\_w8, the Wave 8 sampling design weight.

**Differences with the Harmonized HRS COVID**

Unlike SHARE, the HRS does not provide sampling design weight, sampling units, and stratification variables with their COVID data.

**Comparability with the Gateway Harmonized SHARE**

RrCOVWTSAMP: This variable is related to RwWTSAMP, which is the design weight of Wave `w', in the Gateway Harmonized SHARE.

RAPSU1: This variable is comparable to RAPSU1 in the Gateway Harmonized SHARE.

RAPSU2: This variable is comparable to RAPSU2 in the Gateway Harmonized SHARE.

RAESTRAT1: This variable is comparable to RAESTRAT1 in the Gateway Harmonized SHARE.

RAESTRAT2: This variable is comparable to RAESTRAT2 in the Gateway Harmonized SHARE.

**SHARE Variables Used:**

|                           |                                            |

| 1     | R1COVWTHH  | r1covwthh:r1 COVID: hhold cross-sect weight, COVID sample      | Cont |
| 2     | R2COVWTHH  | r2covwthh:r2 COVID: hhold cross-sect weight, COVID sample      | Cont |
| 1     | R1COVWTHHM | r1covwthhm:r1 COVID: hhold cross-sect weight, main + COVID sam | Cont |

### Descriptive Statistics

| Variable   | N     | Mean    | Std Dev  | Minimum | Maximum  |
|------------|-------|---------|----------|---------|----------|
| R1COVWTHH  | 57538 | 2720.56 | 6319.36  | 6.80    | 353558.5 |
| R2COVWTHH  | 49254 | 2723.38 | 10443.42 | 0.15    | 532341.9 |
| R1COVWTHHM | 36825 | 4080.32 | 10249.16 | 25.78   | 502204.7 |

### How Constructed:

RrCOVWTHH is the household cross-sectional weight for the SHARE Corona Survey sample. R1COVWTHH is taken directly from cchw\_w8\_ca, the Round 1 household weight, and R2COVWTHH is taken directly cchw\_w9ca\_ca, the Round 2 household weight.

RrCOVWTHHM is the household cross-sectional weight for the core SHARE Wave 8 and SHARE Corona Survey samples. Please note that the first COVID round was conducted during Wave 8 of the SHARE core survey, so there are panel members who were interviewed in both Wave 8 and the SHARE Corona Survey. R1COVWTHHM is taken directly from cchw\_w8\_main\_ca, the calibrated cross-sectional household weight for the core SHARE Wave 8 and SHARE Corona Survey interviews.

Cross-sectional household weights are based on the household design weight and the calibration variables of all 50+ respondents in the same household. SHARE's calibration is based on the size of each country's populations of individuals born in 1964 or earlier across eight gender-age groups.

### Cross Round Differences in SHARE

Round 2 does not include the household cross-sectional weight for the core SHARE wave and SHARE Corona Survey samples.

### Differences with the Harmonized HRS COVID

Unlike SHARE, the HRS does not provide household cross-sectional weights with their COVID data.

### Comparability with the Gateway Harmonized SHARE

RrCOVWTHH: This variable is related to RwwTHH, which is the household analysis weight for Wave 'w', in the Gateway Harmonized SHARE.

### SHARE Variables Used:

Round 1 Covid-19:

CCHW\_W8\_CA Calibrated cross-sectional household weight - CA interv

CCHW\_W8\_MAIN\_CA Calibrated cross-sectional household weight - Main & CA

Round 2 Covid-19:

CCHW\_W9CA\_CA Calibrated cross-sectional household weight - CA interv

Person-Level Analysis Weight

| Round | Variable     | Label                                                          | Type |
|-------|--------------|----------------------------------------------------------------|------|
| 1     | R1COVWTRESP  | r1covwtresp:r1 COVID: r person-lvl cross-sect weight, COVID sa | Cont |
| 2     | R2COVWTRESP  | r2covwtresp:r2 COVID: r person-lvl cross-sect weight, COVID sa | Cont |
| 1     | R1COVWTRESPM | r1covwtrespm:r1 COVID: r person-lvl cross-sect weight, main +  | Cont |

Descriptive Statistics

| Variable     | N     | Mean    | Std Dev  | Minimum | Maximum   |
|--------------|-------|---------|----------|---------|-----------|
| R1COVWTRESP  | 57182 | 3257.23 | 7188.11  | 34.47   | 296423.5  |
| R2COVWTRESP  | 49072 | 3225.26 | 13180.74 | 18.75   | 1211786.0 |
| R1COVWTRESPM | 36625 | 4965.54 | 11967.92 | 50.94   | 454072.6  |

How Constructed:

RrCOVWTRESP is the person-level cross-sectional weight for the SHARE Corona Survey sample. R1COVWTRESP is taken directly from cciw\_w8\_ca, the Round 1 individual weight, and R2COVWTRESP is taken directly from cciw\_w9ca\_ca, the Round 2 individual weight.

RrCOVWTRESPM is the person-level cross-sectional weight for the core SHARE Wave 8 and SHARE Corona Survey samples. Please note that the first COVID round was conducted during Wave 8 of the SHARE core survey, so there are panel members who were interviewed in both Wave 8 and the SHARE Corona Survey. R1COVWTRESPM is taken directly from cciw\_w8\_main\_ca, the calibrated cross-sectional individual weight for the core SHARE Wave 8 and SHARE Corona Survey interviews.

Cross-sectional respondent weights are based on the household design weight and the calibration variables of the respondent. They are only generated for respondents aged 50 or older. SHARE's calibration is based on the size of each country's populations of individuals born in 1964 or earlier across eight gender-age groups.

Cross Round Differences in SHARE

Round 2 does not include the person-level cross-sectional weight for the core SHARE waves and SHARE Corona Survey samples.

Differences with the Harmonized HRS COVID

Unlike SHARE, the HRS does not provide respondent cross-sectional weights with their COVID data.

Comparability with the Gateway Harmonized SHARE

RrCOVWTRESP: This variable is related to RwwTRESP, which is the person-level analysis weight for Wave `w`, in the Gateway Harmonized SHARE.

SHARE Variables Used:

| A     | IMPLICAT | implicat: implicate number | Cont |

Descriptive Statistics

|          |       |      |         |         |         |
|----------|-------|------|---------|---------|---------|
| Variable | N     | Mean | Std Dev | Minimum | Maximum |
| IMPLICAT | 58321 | 1.00 | 0.00    | 1.00    | 1.00    |

How Constructed:

IMPLICAT is a SHARE-defined variable which indicates which implicate was used for imputations. SHARE uses a Multiple Imputation method for missing values, which is explained in detail in Dimitris Christelis’ “Imputations of Missing Data in Waves 1 and 2 of SHARE”, available on [share-project.org](https://share-project.org).

The Gateway Harmonized SHARE-Covid dataset includes implicate 1 values for all imputed values.

Cross Round Differences in SHARE

No differences known.

Differences with the Harmonized HRS COVID

The HRS Covid does not employ a Multiple Imputation method.

Comparability with the Gateway Harmonized SHARE

IMPLICAT: This variable is comparable to IMPLICAT in the Gateway Harmonized SHARE.

SHARE Variables Used:

| S2CIWY   | 31958 | 2021.00 | 0.00    | 2021.00 | 2021.00 |

### How Constructed:

These variables are derived from the reported month and year when the COVID interview took place.

RrCIWM and RrCIWY indicate the respondent's interview month and year, respectively. RrCIWM and RrCIWY are assigned plain missing (.) if the respondent did not participate in the current COVID round.

SrCIWM and SrCIWY indicate the respondent's spouse's interview month and year, respectively. SrCIWM and SrCIWY are taken from the spouse's values to RrCIWM and RrCIWY, respectively. In addition to the special missing values used in RrCIWM and RrCIWY, SrCIWM and SrCIWY employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

### Cross Round Differences in SHARE

No differences known.

### Differences with the Harmonized HRS COVID

No differences known.

### Comparability with the Gateway Harmonized SHARE

RrCIWM: This variable is comparable to RrCIWM in the Gateway Harmonized SHARE.

RrCIWY: This variable is comparable to RrCIWY in the Gateway Harmonized SHARE.

**SHARE Variables Used:**

|                   |                                              |

| 0.Age calculated by SHARE    | 36830    | 49263    |
| 1.Additional age calculation | 20717    |          |
| Value-----                   | S1CFAGEY | S2CFAGEY |
| .u:Unmar                     | 17416    | 15138    |
| .v:Sp NR                     | 3415     | 2169     |
| 0.Age calculated by SHARE    | 23324    | 31956    |
| 1.Additional age calculation | 13392    |          |

### How Constructed:

RrCAGEY indicates the respondent's age in years at the time of the interview. The respondent's age has been calculated by SHARE and is provided in the COVID data files. For some missing responses, the respondent's age at interview was calculated by subtracting their year of birth from the year of interview. RrCAGEY is coded as plain missing (.) if the respondent did not participate in the current COVID round.

There are some cases where the respondent's age was missing and not originally calculated by SHARE. These cases are flagged by RrCFAGEY. RrCFAGEY is coded as 0 if the respondent's age was calculated by SHARE. RrCFAGEY is coded as 1 if the respondent's age was not calculated by SHARE and was derived by subtracting the year of birth from the year of interview. RrCFAGEY is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCAGEY indicates the respondent's spouse's age in years at the time of the interview. SrCFAGEY is a flag indicating whether the respondent's spouse's age was missing and not originally calculated by SHARE. SrCAGEY and SrCFAGEY are taken from the spouse's value to RrCAGEY and RrCFAGEY, respectively. In addition

to the special missing values used in RrCAGEY and RrCFAGEY, SrCAGEY and SrCFAGEY employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

**Cross Round Differences in SHARE**

| 0.No gender change | 36716     | 31956     |

How Constructed:

RAGENDER indicates the respondent's gender. Gender was derived by looking at the RAGENDER variable from the Gateway Harmonized SHARE vG dataset and the report from COVID Rounds 1-2. The first non-missing gender was always used, prioritizing responses in the following order: Gateway Harmonized SHARE vG, COVID Round 1, COVID Round 2. RAGENDER is coded as 1 for men. RAGENDER is coded as 2 for women.

RACFGENDR is a flag indicating whether the respondent's gender changed between the Gateway Harmonized SHARE vG and COVID Rounds 1-2. RACFGENDR is coded as 1 if the respondent's gender changed between the Gateway Harmonized SHARE vG and Rounds 1-2.

SrCGENDER indicates the respondent's spouse's gender. SrCFGENDR is a flag indicating whether the respondent's spouse's gender changed between the Gateway Harmonized SHARE vG and COVID Rounds 1-2. SrCGENDER and SrCFGENDR are taken from the spouse's values to RAGENDER and RACFGENDR, respectively. In

addition to the special missing values used in RAGENDER and RACFGENDR, SrCGENDER and SrCFGENDR employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round, but their spouse is not interviewed.

How Constructed:

RrCMARRP indicates whether the respondent is married or partnered at the current COVID round. RrCMARRP is coded as 0 if they are not married or partnered and coded as 1 if they are married or partnered according to the couple ID pairing. RrCMARRP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCMARRP indicates whether the respondent's spouse is married or partnered at the current COVID round. SrCMARRP is taken from the spouse's value to RrCMARRP. In addition to the special missing values used in RrCMARRP, SrCMARRP employs two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

Cross Round Differences in SHARE

No differences known.

Differences with the Harmonized HRS COVID

Unlike the variable RrCMARRP in the Gateway Harmonized SHARE COVID, the Harmonized HRS COVID does not include a binary variable indicating whether or not the respondent was married or partnered at the current COVID round. Instead, the Harmonized HRS COVID includes the variable RrCMSTAT, which indicates the respondent's marital status at the current COVID round with implied partnership status. RrCMSTAT identifies if the respondent was married, partnered, separated, divorced, widowed, or never married at the current round. A comparable marital status variable cannot be made for the Gateway Harmonized SHARE COVID because it is not directly surveyed in the SHARE Corona Survey.

Comparability with the Gateway Harmonized SHARE

RrCMARRP: This variable is related to RwmPART, which indicates whether a respondent partnership is implied in the current wave, and to RwmSTAT, which indicates the respondent's marital status in the current wave with implied partnership status in the Gateway Harmonized SHARE, which also includes other related variables.

SHARE Variables Used:

|                           |                                                  |

| 752.Sweden      | 1424 |
| 756.Switzerland | 1977 |

How Constructed:

COUNTRY is the SHARE country identifier. COUNTRY is a 2-digit code ranging from 11 to 63 which represents the country in which the respondent was surveyed. The codes are mapped as follows: 11.Austria, 12.Germany, 13.Sweden, 14.Netherlands, 15.Spain, 16.Italy, 17.France, 18.Denmark, 19.Greece, 20.Switzerland, 23.Belgium, 25.Israel, 28.Czech Republic, 29.Poland, 31.Luxembourg, 32.Hungary, 33.Portugal, 34.Slovenia, 35.Estonia, 47.Croatia, 48.Lithuania, 51.Bulgaria, 53.Cyprus, 55.Finland, 57.Latvia, 59.Malta, 61.Romania, and 63.Slovakia.

ISOCOUNTRY is a modified version of the SHARE variable COUNTRY. Using ISO 3166-1 (numeric-3) codes, ISOCOUNTRY indicates the country in which surveying took place. The codes are mapped as follows: 40.Austria, 56.Belgium, 100.Bulgaria, 191.Croatia, 196.Cyprus, 203.Czech Republic, 208.Denmark, 233.Estonia, 246.Finland, 250.France, 276.Germany, 300.Greece, 348.Hungary, 372.Ireland, 376.Israel, 380.Italy, 428.Latvia, 440.Lithuania, 442.Luxembourg, 470.Malta, 528.Netherlands, 616.Poland, 620.Portugal, 642.Romania, 703.Slovakia, 705.Slovenia, 724.Spain, 752.Sweden, and 756.Switzerland. ISOCOUNTRY is helpful for matching respondents to country-level statistics where countries are often identified using ISO codes.

ISOA3 are three-letter country codes which indicate the country in which surveying took place. The codes are mapped as follows: AUT-Austria, BEL-Belgium, BGR-Bulgaria, HRV-Croatia, CYP-Cyprus, CZE-Czech Republic, DNK-Denmark, EST-Estonia, FIN-Finland, FRA-France, DEU-Germany, GRC-Greece, HUN-Hungary, IRL-Ireland, ISR-Israel, ITA-Italy, LVA-Latvia, LTU-Lithuania, LUX-Luxembourg, MLT-Malta, NLD-Netherlands, POL-Poland, PRT-Portugal, ROU-Romania, SVK-Slovakia, SVN-Slovenia, ESP-Spain, SWE-Sweden, and CHE-Switzerland. ISOA3 is helpful for matching respondents to country-level statistics where countries are often identified using ISO codes, such as in the OxCGRT data.

Cross Round Differences in SHARE

No differences known.

Differences with the Harmonized HRS COVID

Only the United States is part of HRS, whereas the above listed countries participate in the SHARE survey.

Comparability with the Gateway Harmonized SHARE

- COUNTRY: This variable is comparable to COUNTRY in the Gateway Harmonized SHARE.
- ISOCOUNTRY: This variable is comparable to ISOCOUNTRY in the Gateway Harmonized SHARE.
- ISOA3: This variable is comparable to ISOA3 in the Gateway Harmonized SHARE.

SHARE Variables Used:

### How Constructed:

RrCLANG\_S indicates the language that the respondent's interview was conducted in. RrCLANG\_S is coded as follows: 1.German, 2.Swedish, 3.Dutch, 4.Spanish, 5.Italian, 6.French, 7.Danish, 8.Greek, 9.Flemish, 10.Hebrew, 11.Arabic, 12.Russian, 13.Czech, 14.Polish, 15.English, 16.Hungarian, 17.Portuguese, 18.Slovenian, 19.Estonian, 20.Catalan, 21.Croatian, 22.Luxembourgian, French, German, or Portuguese, 23.Estonian or Russian, 24.Spanish or Catalan, 25.French or German, 26.French, German, or Portuguese, 27.Lithuanian, 28.Bulgarian, 29.Finnish, 30.Latvian, 31.Maltese, 32.Romanian, or 33.Slovakian. RrCLANG\_S is set to plain missing (.) for respondents who did not respond to the current COVID round.

SrCLANG\_S indicates the language that the respondent's spouse's interview was conducted in. SrCLANG\_S is taken from the spouse's value to RrCLANG\_S. In addition to the special missings values used in RrCLANG\_S, SrCLANG\_S employs two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round, but their spouse is not interviewed.

### Cross Round Differences in SHARE

No differences known.

### Differences with the Harmonized HRS COVID

While the HRS COVID includes an indicator for the language of the interview (RrCLANG\_H), it only includes two possible answer choices: 1.English and 2.Spanish. Due to the number of countries that participate in the SHARE Corona Survey, RrCLANG\_S in SHARE includes additional answer choices.

### Comparability with the Gateway Harmonized SHARE

RrCLANG\_S: This variable is comparable to RrLANG\_S in the Gateway Harmonized SHARE.

### SHARE Variables Used:

Round 1 Covid-19:  
LANGUAGE\_CA      Language of questionnaire  
Round 2 Covid-19:  
LANGUAGE          Language of questionnaire

### How Constructed:

Please note that Round 1 of the SHARE Corona Survey was conducted during Wave 8 of the SHARE main survey. At Round 1, the following question was asked during the Wave 8 Coverscreen of the SHARE main survey.

RrCNHMLIV indicates whether the respondent lives in an institution at the time of the interview. The SHARE interviewer is asked whether the respondent is living in a nursing home or in a private household. RrCNHMLIV is coded as 0 if the SHARE interviewer reports that the respondent is living in a private household. RrCNHMLIV is coded as 1 if the SHARE interviewer reports that the respondent is living in a nursing home. Missing responses are assigned special missing value (.m). RrCNHMLIV is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCNHMLIV indicates whether the respondent's spouse lives in an institution at the time of the interview. SrCNHMLIV is taken from the spouse's value to RrCNHMLIV. In addition to the special missing values used in RrCNHMLIV, SrCNHMLIV employs two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondents reports being coupled in the current round, but their spouse is not interviewed.

### Cross Round Differences in SHARE

Round 1 was conducted during Wave 8 of the SHARE main survey, so RrCNHMLIV is derived from the variable NURSINGHOME, which was asked during the Wave 8 Coverscreen of the SHARE main survey.

### Differences with the Harmonized HRS COVID

In the HRS COVID, respondents are asked whether they are living in a nursing home or other long-term

health care facility. In SHARE, this question is asked in the Coverscreen of Wave 8 of the SHARE main survey as the SHARE Corona Survey was conducted during Wave 8. In SHARE, interviewers are asked whether the respondent is living in a private household or in a nursing home.

**Comparability with the Gateway Harmonized SHARE**

RwCNHMLIV: This variable is comparable to RwnHMLIV in the Gateway Harmonized SHARE.

**SHARE Variables Used:**

- Round 1 Covid-19:
- NURSINGHOME

Nursing home
- Round 2 Covid-19:
- NURSINGHOME

Nursing home

**Section B: COVID-19**

### How Constructed:

RrCOVTEST indicates the respondent's COVID-19 test results at the current COVID round. RrCOVTEST is only available at Round 1. At Round 1, the respondent is asked if they or anyone close to them have been tested for COVID-19 and whether the result was positive or negative. RrCOVTEST is coded as 0 if the respondent reports they tested negative for COVID-19 or if they report that they or someone close to them tested positive for COVID-19 but it was not the respondent who tested positive for COVID-19. RrCOVTEST is coded as 1 if the respondent reports that they tested positive for COVID-19. Special missing value (.n) is assigned if the respondent did not test positive or negative for COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCOVTEST is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCOVID indicates whether the respondent has ever tested positive for COVID-19 by the current COVID round. In Round 1, the respondent is asked if they or anyone close to them have been tested for COVID-19 and whether the result was positive. In Round 2, the question refers to the time period since the last interview or since July 2020. RrCOVID is coded as 0 if the respondent reports that neither they nor anyone close to them tested for COVID-19 and had a positive result. RrCOVID is also coded as 0 if the respondent reports that they or someone close to them tested for COVID-19 and had a positive result, but it was not the respondent who tested positive. RrCOVID is coded as 1 if the respondent reports that they tested for COVID-19 and the result was positive at any round. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCOVID is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCOVFTEST and RrFCOVID are flag variables that indicate whether responses to RrCOVTEST and RrCOVID, respectively, are imputed by SHARE. These variables are only available at Round 1, and are assigned 0 if responses are not imputed and 1 if responses are imputed. RrCOVFTEST and RrFCOVID are coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCOVTEST indicates the respondent's spouse's COVID-19 test results at the current COVID round. SrCOVID indicates whether the respondent's spouse has ever tested positive for COVID-19 by the current COVID round. SrCOVFTEST and SrFCOVID are flag variables that indicate whether the respondent's spouse's responses are imputed by SHARE. The spouse variables are taken from the spouse's value to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

The question related to COVID-19 test result was only asked at Round 1.

RrCOVFTEST and RrFCOVID are only available at Round 1 because Round 2 does not provide imputed values as part of its public release.

At Round 1, respondents are asked to report if they or anyone close to them have tested positive or negative for COVID-19, while at Round 2, respondents are asked if they or anyone close to them have tested positive or negative for COVID-19 since their last interview (since July 2020).

## Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID asks respondents at both rounds whether they have had or now have COVID-19, available as RrSRCOV. Respondents are also asked if they have been tested for COVID-19 once or multiple times, whether their COVID-19 test(s) indicated that they had the virus ("yes", "no", or "waiting for results"), and whether a doctor or other health care provider told them they have COVID-19, all of which are used to assign values to RrCOVID. At Round 2, the HRS COVID also asks respondents to report their COVID-19 antibody test results, available as RrCOVAB. In Round 1 of the SHARE Corona survey, respondents are asked separately if they or someone close to them had been tested for COVID-19 and the result was positive, or if they or someone close to them had been tested for COVID-19 and the result was negative. If the respondent answered yes to either question, they were then asked to identify the relationship of the person who tested positive or negative. In Round 2, respondents are only asked whether they or someone close to them had tested positive since their last interview or July 2020, and if so, to identify the relationship of the person who tested positive. These questions are used to assign values to RrCOVID. The SHARE Corona survey does not ask respondents to report their COVID-19 antibody test results. The HRS COVID also does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

## SHARE Variables Used:

### Round 1 Covid-19:

|            |                                             |

### How Constructed:

RrCOVSYMP indicates whether the respondent experienced any symptoms of COVID-19. At Round 1, the respondent is asked whether they or anyone close to them had experienced symptoms that they would attribute to COVID-19, such as cough, fever, or difficulty breathing, since the outbreak of the pandemic. At Round 2, the respondent is asked whether they or anyone close to them had experienced symptoms that they would attribute to COVID-19, such as cough, fever, or difficulty breathing, since their last interview (since July 2020). RrCOVSYMP is coded as 0 if the respondent reported that neither they nor

anybody close to them experienced symptoms that they would attribute to COVID-19. RrCOVSYP is also coded as 0 if the respondent reported that they or someone close to them experienced symptoms that they would attribute to COVID-19, but it was not the respondent who experienced symptoms. RrCOVSYP is coded as 1 if the respondent reports that they experienced symptoms that they would attribute to COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCOVSYP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCOVFSYP is a flag variable that indicates whether responses to RrCOVSYP are imputed by SHARE. RrCOVFSYP is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCOVFSYP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCOVSYP indicates whether the respondent's spouse experienced any symptoms of COVID-19. SrCOVFSYP is a flag variable that indicates whether responses to SrCOVSYP are imputed by SHARE. SrCOVSYP and SrCOVFSYP are taken from the spouse's values to RrCOVSYP and RrCOVFSYP, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

### Cross Round Differences in SHARE

RrCOVFSYP is only available at Round 1 because Round 2 does not provide imputed values as part of its public release.

At Round 1, respondents are asked to report if they or anyone close to them have experienced symptoms that they would attribute to COVID-19 since the outbreak of the pandemic, while at Round 2, respondents are asked to report if they or anyone close to them have experienced symptoms that they would attribute to COVID-19 since their last interview.

### Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents to report whether they experienced symptoms of COVID-19. The HRS COVID also does not provide imputed values as part of its public release.

### Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### SHARE Variables Used:

#### Round 1 Covid-19:

|              |                                               |

## How Constructed:

RrCOVLSYMP indicates whether the respondent experienced long-term health problems related to COVID-19 infection. RrCOVLSYMP is only available at Round 2. At Round 2, respondents are first asked if they or anyone close to them have experienced symptoms that they would attribute to COVID-19, such as cough, fever, difficulty breathing, or loss of sense of taste or smell since their last interview (since July 2020). Then, they are asked if they or anyone close to them have tested positive for COVID-19 since their last interview (since July 2020). If the respondent reported that they have experienced symptoms that they would attribute to COVID-19 or tested positive for COVID-19, they are then asked to report whether they have experienced any long-term or lingering effects that they would attribute to their COVID-19 illness, including fatigue; cough, congestion, shortness of breath; loss of taste or smell; headache; body aches, joint pain; chest or abdominal pain; diarrhea, nausea; confusion; other; or no symptoms at all. RrCOVLSYMP is coded as 0 if the respondent reported that they did not experience symptoms at all. RrCOVLSYMP is also coded as 0 if the respondent reported that they did not experience any of the listed long-term health problems related to COVID-19 infection. RrCOVLSYMP is coded as 1 if the respondent reported experiencing any of the long-term health problems related to COVID-19 infection. Special missing value (.c) is assigned if the respondent was not asked this question because they did not report having experienced any symptoms of COVID-19 and did not report testing positive for COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCOVLSYMP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCOVLSYMP indicates whether the respondent's spouse experienced long-term health problems related to COVID-19 infection. SrCOVLSYMP is taken from the spouse's value to RrCOVLSYMP. In addition to the special missing values used in RrCOVLSYMP, SrCOVLSYMP employs two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

RrCOVLSYMPT indicates the type of long-term health problem(s) the respondent experienced related to COVID-19 infection. RrCOVLSYMPT is only available at Round 2. RrCOVLSYMPT is coded as 1 if the respondent experienced long-term physical health problems (i.e. fatigue; cough, congestion, shortness of breath; loss of taste or smell; headache; body aches, joint pain; chest or abdominal pain; diarrhea, nausea) related to COVID-19 infection. RrCOVLSYMPT is coded as 2 if the respondent experienced long-term mental health problems (i.e. confusion) related to COVID-19 infection. RrCOVLSYMPT is coded as 3 if the respondent experienced both long-term physical and mental health problems related to COVID-19 infection. Special missing value (.c) is assigned if the respondent was not asked this question because they did not report having experienced any symptoms of COVID-19 and did not report testing positive for COVID-19. Special missing value (.l) is assigned if the respondent reported that they had COVID-19, but didn't report having long-term health problems related to COVID-19. Special missing value (.o) is assigned if the respondent reported that they had COVID-19 and experienced long-term symptoms from COVID-19, but only reported that they experienced another type of long-term symptom from COVID-19 that was not listed in the survey. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCOVLSYMPT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCOVLSYMPT indicates the type of long-term health problem(s) the respondent's spouse experienced related to COVID-19 infection. SrCOVLSYMPT is taken from the spouse's value to RrCOVLSYMPT. In addition to the special missing values used in RrCOVLSYMPT, SrCOVLSYMPT employs two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

The question related to long-term symptoms experienced from COVID-19 was only asked at Round 2.

## Differences with the Harmonized HRS COVID

While both the HRS COVID and the SHARE Corona survey ask respondents to report whether they experienced long-term symptoms from COVID-19 and to report the type of long-term symptoms they experienced from

COVID-19, these questions are asked at different rounds and incorporate different skip patterns. RrCOVLSYMP is available in the Harmonized HRS COVID at both Rounds 1 and 2 while it is only available at Round 2 in the Gateway Harmonized SHARE COVID. RrCOVLSYMPT is only available at Round 1 in the Harmonized HRS COVID and at Round 2 in the Gateway Harmonized SHARE COVID. In the HRS COVID, respondents are asked these two questions if they report that they had or probably have COVID-19. In the SHARE Corona survey, this information is obtained in a single question if the respondent reported that they experienced symptoms that could be attributed to COVID-19 or if they reported that they tested positive for COVID-19.

In the HRS COVID, respondents are asked to report if they experienced physical, mental, or both physical and mental long-term symptoms from COVID-19, while in the SHARE Corona survey respondents are asked to report if they experienced specific long-term symptoms from COVID-19, including: fatigue; cough, congestion, shortness of breath; loss of taste or smell; headache; body aches, joint pain; chest or abdominal pain; diarrhea, nausea; confusion; other; or no symptoms at all. To make the options for type of long-term symptom experienced comparable across datasets, confusion in the SHARE Corona survey is considered a mental health long-term symptom, while fatigue; cough, congestion, shortness of breath; loss of taste or smell; headache; body aches; chest or abdominal pain; and diarrhea are considered as physical long-term symptoms.

The HRS COVID also does not provide imputed values as part of its public release.

### Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

## How Constructed:

At Round 1, the respondent is first asked whether they or anyone close to them have been hospitalized due to an infection from COVID-19. At Round 2, the respondent is first asked whether they or anyone close to them have been hospitalized due to an infection from COVID-19 since their last interview (since July 2020). In both rounds, if the respondent reported that they or anyone close to them have been hospitalized due to an infection from COVID-19, they are then asked to identify their relationship with the person who was hospitalized.

RrCOVHOSP indicates whether the respondent has been hospitalized due to COVID-19. RrCOVHOSP is coded as 0 if the respondent reports that neither they nor anyone close to them have been hospitalized due to an infection from COVID-19. RrCOVHOSP is also coded as 0 if the respondent reports that they or someone close to them had been hospitalized due to an infection from COVID-19, but it was not the respondent who had been hospitalized. RrCOVHOSP is coded as 1 if the respondent reports that they have been hospitalized due to an infection from COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCOVHOSP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCOVFHOSP is a flag variable that indicates whether responses to RrCOVHOSP are imputed by SHARE. RrCOVFHOSP is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCOVFHOSP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCOVHOSPE indicates whether the respondent has ever been hospitalized due to COVID-19. RrCOVHOSPE is only available at Round 2. Previous reports from Round 1 are fed forward to derive R2COVHOSPE. RrCOVHOSPE is coded as 0 if the respondent reports that neither they nor anyone close to them have ever been hospitalized due to an infection from COVID-19. RrCOVHOSPE is also coded as 0 if the respondent reports that they or someone close to them had ever been hospitalized due to an infection from COVID-19, but it was not the respondent who had ever been hospitalized. RrCOVHOSPE is coded as 1 if the respondent reports ever being hospitalized due to an infection from COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCOVHOSPE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCOVHOSP indicates whether the respondent's spouse has been hospitalized due to COVID-19. SrCOVFHOSP is a flag variable that indicates whether responses to SrCOVHOSP are imputed by SHARE. SrCOVHOSPE indicates whether the respondent's spouse has ever been hospitalized due to COVID-19. SrCOVHOSP, SrCOVFHOSP, and SrCOVHOSPE are taken from the spouse's values to RrCOVHOSP, RrCOVFHOSP, and RrCOVHOSP, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked to report if they or anyone close to them have been hospitalized due to an infection from COVID-19, while at Round 2, respondents are asked if they or anyone close to them have been hospitalized due to an infection from COVID-19 since their last interview (since July 2020).

For comparability across studies and rounds, two variables are derived: RrCOVHOSP, which indicates whether the respondent has been hospitalized due to COVID-19, and RrCOVHOSPE, which indicates whether the respondent has ever been hospitalized due to COVID-19. RrCOVHOSP is available at both rounds while

RrCOVHOSPE is only available at Round 2, with previous reports from Round 1 fed forward to derive R2COVHOSPE.

RrCOVHOSP is only available at Round 1 because Round 2 does not provide imputed values as part of its public release.

### **Differences with the Harmonized HRS COVID**

The HRS COVID asks questions about hospitalization due to COVID-19 without a time reference at both rounds. Due to the greater length of the implied timeframe since the start of the pandemic in Round 2, the Harmonized HRS COVID includes R1COVHOSP and R2COVHOSPE. The SHARE Corona Survey asks questions about hospitalization without a specific timeframe but implying since the start of the pandemic in Round 1 and since their previous interview in Round 2. As a result of these more concrete timeframes, the Gateway Harmonized SHARE COVID includes R1COVHOSP, R2COVHOSP, and R2COVHOSPE.

Unlike the SHARE Corona survey, the HRS COVID asks additional questions about whether the respondent visited an emergency room due to COVID-19 (RrCOVERVST), the month and year the respondent was hospitalized due to COVID-19 (RrCOVHSPMO and RrCOVHSPYR), the number of nights the respondent was hospitalized due to COVID-19 (RrCOVHSPNIT), whether the respondent was on oxygen while hospitalized due to COVID-19 (RrCOVHSPOX), or whether the respondent was on a ventilator while hospitalized due to COVID-19 (RrCOVHSPVEN). The HRS COVID also does not provide imputed values as part of its public release.

### **Comparability with the Gateway Harmonized SHARE**

No comparable variables are available in the Gateway Harmonized SHARE.

### **SHARE Variables Used:**

#### **Round 1 Covid-19:**

|            |                                          |

### How Constructed:

RrCOVVAC indicates whether the respondent received a COVID-19 vaccine. RrCOVVAC is only available at Round 2. At Round 2, the respondent is asked to report whether they have been vaccinated against COVID-19. RrCOVVAC is coded as 0 if the respondent reports that they have not been vaccinated against COVID-19.

RrCOVVAC is coded as 1 if the respondent reports that they have been vaccinated against COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCOVVAC is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCOVVACW indicates whether the respondent wants to get a COVID-19 vaccine. RrCOVVACW is only available at Round 2. At Round 2, the respondent is asked to report whether they wanted to get vaccinated against COVID-19 only if they reported that they have not received a COVID-19 vaccine. RrCOVVACW is coded as 0 if the respondent reports that they do not want to get vaccinated against COVID-19. RrCOVVACW is coded as 1 if the respondent reports that they are still undecided regarding whether they want to get vaccinated against COVID-19. RrCOVVACW is coded as 2 if the respondent reports that they want to get vaccinated against COVID-19. RrCOVVACW is also coded as 2 if the respondent reports that they already have a vaccination scheduled. Special missing value (.s) is assigned if the respondent wasn't asked this question because they reported that they have received a COVID-19 vaccine. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCOVVACW is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCOVVAC indicates whether the respondent's spouse has received a COVID-19 vaccine. SrCOVVACW indicates whether the respondent's spouse wants to get a COVID-19 vaccine. SrCOVVAC and SrCOVVACW are taken from the spouse's values to RrCOVVAC and RrCOVVACW, respectively. In addition to the special missing values used in RrCOVVAC and RrCOVVACW, SrCOVVAC and SrCOVVACW employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

Questions related to COVID-19 vaccines were only asked at Round 2.

## Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask the respondent whether they want to get vaccinated against COVID-19. However, the HRS COVID also asks additional questions about how likely the respondent is to get a future COVID-19 vaccine and the number of COVID-19 vaccines the respondent has already received.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

## SHARE Variables Used:

Round 2 Covid-19:

|          |                                                  |
|----------|--------------------------------------------------|

### How Constructed:

At Round 1, respondents are asked whether they or anyone close to them have tested positive for COVID-19. At Round 2, respondents are asked whether they or anyone close to them have tested positive for COVID-19 since their last interview (since July 2020). In both rounds, if the respondent reported that they or anyone close to them have tested positive for COVID-19, the respondent is then asked to identify their relationship with the person who tested positive. Such relationships include the respondents themselves, spouse or partner, parent, child, other household member, other relative outside of household, neighbor, friend, or colleague, caregiver, or other.

RrHOCOVIDIAG indicates whether anyone inside or outside of the respondent's household has tested positive for COVID-19, not including the respondent. RrHOCOVDIAG is coded as 0 if the respondent reports that neither they nor anyone close to them tested positive for COVID-19. RrHOCOVDIAG is also coded as 0 if the respondent reports that they or someone close to them tested positive for COVID-19, but that person was only the respondent. RrHOCOVDIAG is coded as 1 if the respondent reports that they or someone close to them tested positive for COVID-19 and they report that at least one person close to them tested positive for COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrHOCOVDIAG is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrHOCOVDIAGE indicates whether anyone inside or outside of the respondent's household has ever tested positive for COVID-19, not including the respondent. RrHOCOVDIAGE is only available at Round 2. Previous

reports from Round 1 are fed forward to derive R2HOCOVDIAGE. RrHOCOVDIAGE is coded as 0 if the respondent reports that neither they nor anyone close to them has ever tested positive for COVID-19. RrHOCOVDIAGE is also coded as 0 if the respondent reports that they or someone close to them has ever tested positive for COVID-19, but that person was only the respondent. RrHOCOVDIAGE is coded as 1 if the respondent reports that they or someone close to them has ever tested positive for COVID-19 and they report that at least one person close to them has ever tested positive for COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrHOCOVDIAGE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

HHrHOCOVDIAG indicates whether anyone inside or outside of the respondent's household has tested positive for COVID-19, including the respondent. HHrHOCOVDIAG is coded as 0 if the respondent reports that neither they nor anyone close to them tested positive for COVID-19. HHrHOCOVDIAG is coded as 1 if the respondent reports that they or someone close to them tested positive for COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. HHrHOCOVDIAG is coded as plain missing (.) if the respondent did not participate in the current COVID round.

HHrHOCOVDIAGE indicates whether anyone inside or outside of the respondent's household has ever tested positive for COVID-19, including the respondent. HHrHOCOVDIAGE is only available at Round 2. Previous reports from Round 1 are fed forward to derive HH2HOCOVDIAGE. HHrHOCOVDIAGE is coded as 0 if the respondent reports that neither they nor anyone close to them has ever tested positive for COVID-19. HHrHOCOVDIAGE is coded as 1 if the respondent reports that they or someone close to them has ever tested positive for COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. HHrHOCOVDIAGE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrHOCOVDIAG and HHrHOCOVDIAG are flag variables that indicate whether responses to RrHOCOVDIAG and HHrHOCOVDIAG, respectively, are imputed by SHARE. RrHOCOVDIAG and HHrHOCOVDIAG are only available at Round 1, and are assigned 0 if responses are not imputed and 1 if responses are imputed. RrHOCOVDIAG and HHrHOCOVDIAG are coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrHOCOVDIAG indicates whether anyone inside or outside of the respondent's spouse's household has tested positive for COVID-19, not including the respondent's spouse. SrHOCOVDIAG indicates whether anyone inside or outside of the respondent's spouse's household has ever tested positive for COVID-19, not including the respondent's spouse. SrHOCOVDIAG is a flag variable that indicates whether responses to SrHOCOVDIAG are imputed by SHARE. SrHOCOVDIAG, SrHOCOVDIAGE, and SrHOCOVDIAG are taken from the spouse's values to RrHOCOVDIAG, RrHOCOVDIAGE, and RrHOCOVDIAG, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked to report if they or anyone close to them have tested positive for COVID-19, while at Round 2, respondents are asked if they or anyone close to them have tested positive for COVID-19 since their last interview (since July 2020).

For comparability across studies and rounds, four variables are derived: RrHOCOVDIAG, which indicates whether anyone inside or outside of the respondent's household has tested positive for COVID-19, not including the respondent; RrHOCOVDIAGE, which indicates whether anyone inside or outside of the respondent's household has ever tested positive for COVID-19, not including the respondent; HHrHOCOVDIAG, which indicates whether anyone inside or outside of the respondent's household has tested positive for COVID-19, including the respondent; and HHrHOCOVDIAGE, which indicates whether anyone inside or outside of the respondent's household has ever tested positive for COVID-19, including the respondent. RrHOCOVDIAG and HHrHOCOVDIAG are available at both rounds while RrHOCOVDIAGE and HHrHOCOVDIAGE are only available at Round 2, with previous reports from Round 1 fed forward to derive R2HOCOVDIAGE and HH2HOCOVDIAGE.

RrHOCOVDIAGE and HHrHOCOVDIAGE are only available at Round 1 because Round 2 does not provide imputed values as part of its public release.

## Differences with the Harmonized HRS COVID

The HRS COVID asks questions about people who have been diagnosed with COVID-19 without a time reference at both rounds. Due to the greater length of the implied timeframe since the start of the pandemic in Round 2, the Harmonized HRS COVID includes R1HOCOVDIAG, R2HOCOVDIAGE, HH1HOCOVDIAG, and HH2HOCOVDIAGE. The SHARE Corona Survey asks questions about people who have been diagnosed with COVID-19 without a specific timeframe but implying since the start of the pandemic in Round 1 and since their previous interview in Round 2. As a result of these more concrete timeframes, the Gateway Harmonized SHARE COVID includes R1HOCOVDIAG, R2HOCOVDIAG, R2HOCOVDIAGE, HH1HOCOVDIAG, HH2HOCOVDIAG, and HH2HOCOVDIAGE.

Unlike the SHARE Corona survey, the HRS COVID differentiates between those who are inside or outside of the respondent's household. The Harmonized HRS COVID includes RrHHCovDIAG, which indicates whether any member of the respondent's household has been diagnosed with COVID-19, not including the respondent; HHrCOVDIAG, which indicates whether any member of the respondent's household has been diagnosed with COVID-19, including the respondent; and RrOCOVDIAG, which indicates whether the respondent knows anyone outside their household who has been diagnosed with COVID-19. The HRS COVID also does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### SHARE Variables Used:

#### Round 1 Covid-19:

|            |                                                         |

## How Constructed:

At Round 1, respondents are asked whether anyone close to them has died from COVID-19. At Round 2, respondents are asked whether anyone close to them has died from COVID-19 since their last interview (since July 2020). In both rounds, if the respondent reported that someone close to them died from COVID-19, the respondent is then asked to identify their relationship with the person who died. Such relationships include the respondent's spouse or partner, parent, child, other household member, other relative outside of household, neighbor, friend, or colleague, caregiver, or other.

RrOCOVIED indicates whether the respondent knows anyone who has died from COVID-19. RrOCOVIED is coded as 0 if the respondent reports that nobody close to them has died from COVID-19. RrOCOVIED is coded as 1 if the respondent reports that someone close to them has died from COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrOCOVIED is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrOCOVFDIED is a flag variable that indicates whether responses to RrOCOVIED are imputed by SHARE. RrOCOVFDIED is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrOCOVFDIED is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrOCOVIEDIE indicates whether the respondent knows anyone close to them has ever died from COVID-19. RrOCOVIEDIE is only available at Round 2. Previous reports from Round 1 are fed forward to derive R2OCOVIEDIE. RrOCOVIEDIE is coded as 0 if the respondent reports that nobody close to them has ever died from COVID-19. RrOCOVIEDIE is coded as 1 if the respondent reports that someone close to them has ever died from COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrOCOVIEDIE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrOCOVIED indicates whether the respondent's spouse knows anyone who has died from COVID-19. SrOCOVFDIED is a flag variable that indicates whether responses to SrOCOVIED are imputed by SHARE. SrOCOVIEDIE indicates whether the respondent's spouse knows anyone close to them has ever died from COVID-19. SrOCOVIED, SrOCOVFDIED, and SrOCOVIEDIE are taken from the spouse's values to RrOCOVIED, RrOCOVFDIED, and RrOCOVIEDIE, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked to report if anyone close to them has died due to an infection from COVID-19, while at Round 2, respondents are asked if anyone close to them has died due to an infection from COVID-19 since their last interview (since July 2020).

For comparability across studies and rounds, two variables are derived: RrOCOVIED, which indicates whether the respondent knows anyone who has died from COVID-19, and RrOCOVIEDIE, which indicates whether the respondent knows anyone close to them has ever died from COVID-19. RrOCOVIED is available at both rounds and RrOCOVIEDIE is only available at Round 2, with previous reports from Round 1 fed forward to derive R2OCOVIEDIE.

RrOCOVFDIED is only available at Round 1 because Round 2 does not provide imputed values as part of its public release.

## Differences with the Harmonized HRS COVID

The HRS COVID asks questions about deaths due to COVID-19 without a time reference at both rounds. Due to the greater length of the implied timeframe since the start of the pandemic in Round 2, the Harmonized HRS COVID includes R10COVIDIED and R20COVIDIEDE. The SHARE Corona Survey asks questions about deaths due to COVID-19 without a specific timeframe but implying since the start of the pandemic in Round 1 and since their previous interview in Round 2. As a result of these more concrete timeframes, the Gateway Harmonized SHARE COVID includes R10COVIDIED, R20COVIDIED, and R20COVIDIEDE.

The HRS COVID does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

## SHARE Variables Used:

### Round 1 Covid-19:

|              |                                                        |
|--------------|--------------------------------------------------------|
| COVIDDIED    | COVID-19: anyone died due                              |
| COVIDDIED2   | COVID-19: spouse/partner died                          |
| COVIDDIED2_F | COVID-19: spouse/partner died - flag                   |
| COVIDDIED3   | COVID-19: parent died                                  |
| COVIDDIED3_F | COVID-19: parent died - flag                           |
| COVIDDIED4   | COVID-19: child died                                   |
| COVIDDIED4_F | COVID-19: child died - flag                            |
| COVIDDIED5   | COVID-19: other household member died                  |
| COVIDDIED5_F | COVID-19: other household member died - flag           |
| COVIDDIED6   | COVID-19: other relative outside household died        |
| COVIDDIED6_F | COVID-19: other relative outside household died - flag |
| COVIDDIED7   | COVID-19: neighbor/friend/colleague died               |
| COVIDDIED7_F | COVID-19: neighbor/friend/colleague died - flag        |
| COVIDDIED8   | COVID-19: caregiver died                               |
| COVIDDIED8_F | COVID-19: caregiver died - flag                        |
| COVIDDIED9   | COVID-19: other person died                            |
| COVIDDIED9_F | COVID-19: other person died - flag                     |
| COVIDDIED_F  | COVID-19: anyone died due - flag                       |

### Round 2 Covid-19:

|           |                                                 |
|-----------|-------------------------------------------------|
| CAC113_   | COVID-19: anyone died due to COVID-19           |
| CAC114_2  | COVID-19: spouse or partner died                |
| CAC114_3  | COVID-19: parent died                           |
| CAC114_4  | COVID-19: child died                            |
| CAC114_5  | COVID-19: other household member died           |
| CAC114_6  | COVID-19: other relative outside household died |
| CAC114_7  | COVID-19: neighbor, friend or colleague died    |
| CAC114_8  | COVID-19: caregiver died                        |
| CAC114_97 | COVID-19: other died                            |

### How Constructed:

At Round 1, respondents are asked to report if they have ever left their home since the outbreak of COVID-19. At Round 2, respondents are asked to report whether they have ever left their home during the last three months.

RrCLEAVHME indicates whether the respondent has ever left their home during the given timeframe. RrCLEAVHME is coded as 0 if the respondent reports that they have never left their home during the given timeframe. RrCLEAVHME is coded as 1 if the respondent reports that they have left their home during the

given timeframe. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCLEAVHME is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFLEAVHME is a flag variable that indicates whether responses to RrCLEAVHME are imputed by SHARE. RrCFLEAVHME is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFLEAVHME is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCLEAVHME indicates whether the respondent's spouse has ever left their home since the outbreak of COVID-19. SrCFLEAVHME is a flag variable that indicates whether responses to SrCLEAVHME are imputed by SHARE. SrCLEAVHME and SrCFLEAVHME are taken from the spouse's values to RrCLEAVHME and RrCFLEAVHME, respectively. In addition to the special missing values used in RrCLEAVHME and RrCFLEAVHME, SrCLEAVHME and SrCFLEAVHME employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked to report if they have ever left their home since the outbreak of COVID-19. At Round 2, respondents are asked to report if they have ever left their home during the last three months.

## Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents to report whether they have ever left their home since the outbreak of COVID-19 or during the last three months. The HRS COVID does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### How Constructed:

In Round 1 of the SHARE Corona survey, respondents are asked to report if they have ever left their home since the outbreak of COVID-19. If the respondent reports that they have left their home since the COVID-19 outbreak, they are then asked to report how often they took different precautions - wearing a mask around other people outside their home, keeping their distance from others outside their home, washing their hands or using hand sanitizer, and paying attention to covering coughs and sneezes- during the pandemic. In Round 2 of the SHARE Corona survey, respondents are asked to report if they have ever left their home in the last 3 months. If the respondent reports that they have left their home in the last 3 months, they are then asked to report how often they took different precautions - keeping their distance from others outside their home, paying attention to covering coughs and sneezes. In both rounds, respondents are asked about taking medication as a prevention against COVID-19.

RrcMASKF\_S indicates how often the respondent wore a face mask whenever they went outside their home to a public space. RrcMASKF\_S is only available at Round 1. At Round 1, the respondent may report that they "always", "sometimes", or "never" wore a face mask around other people outside their home during the pandemic. RrcMASKF\_S is coded as 0 if the respondent reports that they never wore a face mask when they went outside their home to a public space. RrcMASKF\_S is coded as 1 if the respondent reports that they sometimes wore a face mask when they went outside their home to a public space. RrcMASKF\_S is coded as 2 if the respondent reports that they often wore a mask when they went outside their home to a public space. RrcMASKF\_S is coded as 3 if the respondent reports that they always wore a mask when they went outside their home to a public space. RrcMASKF\_S is assigned special missing value (.n) if the respondent reported that they never left their home since the outbreak of COVID-19. RrcMASKF\_S is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrcFMASKF\_S is a flag variable that indicates whether responses to RrcMASKF\_S are imputed by SHARE. RrcFMASKF\_S is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrcFMASKF\_S is coded as plain missing (.) if the respondent did not participate in the current COVID round.

To make this question comparable across Harmonized COVID datasets, a binary variable, RrcMASK, has been created that combines "always", "often", and "sometimes" into one category. RrcMASK is only available at Round 1. RrcMASK is coded as 0 if the respondent reports that they never wore a face mask whenever they went outside their home to a public space. RrcMASK is coded as 1 if the respondent reports that they sometimes, often, or always wore a face mask whenever they went outside their home to a public space. RrcMASK is assigned special missing value (.n) if the respondent reported that they never left their home since the outbreak of COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrcMASK is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrcDISTF\_S indicates how often the respondent kept their distance from others when they went outside their home. At both rounds, the respondent may report that they "always", "sometimes", or "never" kept their distance from others when they went outside their home, but the timeframe for Round 1 is during the

pandemic and the timeframe for Round 2 is the last three months. RrCDISTF\_S is coded as 0 if the respondent reports that they never kept their distance from others when they went outside their home. RrCDISTF\_S is coded as 1 if the respondent reports that they sometimes kept their distance from others when they went outside their home. RrCDISTF\_S is coded as 2 if the respondent reports that they often kept their distance from others when they went outside their home. RrCDISTF\_S is coded as 3 if the respondent reports that they always kept their distance from others when they went outside their home. RrCDISTF\_S is assigned special missing value (.n) if the respondent reported that they never left their home in the specified timeframe. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDISTF\_S is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFDISTF\_S is a flag variable that indicates whether responses to RrCDISTF\_S are imputed by SHARE. RrCFDISTF\_S is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFDISTF\_S is coded as plain missing (.) if the respondent did not participate in the current COVID round.

To make this question comparable across Harmonized COVID datasets, a binary variable, RrCDIST, has been created that combines "always", "often", and "sometimes" into one category. At both rounds, the respondent is asked to report how often they kept their distance from others when they went outside their home, but the timeframe for Round 1 is during the pandemic and the timeframe for Round 2 is during the last three months. RrCDIST is coded as 0 if the respondent reports that they never kept their distance from others when they went outside their home. RrCDIST is coded as 1 if the reports that they sometimes, often, or always kept their distance from others when they went outside their home. RrCDIST is assigned special missing value (.n) if the respondent reported that they never left their home since the outbreak of COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDIST is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCWASH indicates whether the respondent washed their hands or used special hand sanitizer or disinfection fluids more frequently than usual (before the outbreak of COVID-19). RrCWASH is only available at Round 1. At Round 1, respondents were asked separately if they washed their hands more frequently than usual and if they used special hand sanitizer or disinfection fluids more frequently than usual. RrCWASH is coded as 0 if the respondent reports that they do not wash their hands or use special hand sanitizer or disinfection fluids more frequently than usual. RrCWASH is coded as 1 if the respondent reports that they do wash their hands or use special hand sanitizer or disinfection fluids more frequently than usual. RrCWASH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFWASH is a flag variable that indicates whether responses to RrCWASH are imputed by SHARE. RrCFWASH is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFWASH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCCVRCGH indicates whether the respondent paid special attention to covering their cough or sneeze. RrCCVRCGH is only available at Round 1. At Round 1, the respondent may report either "yes" or "no" to whether they paid special attention to covering their cough or sneeze since the outbreak of COVID-19. RrCCVRCGH is coded as 0 if the respondent reports that they did not pay special attention to covering their cough or sneeze. RrCCVRCGH is coded as 1 if the respondent reports that they did pay special attention to covering their cough or sneeze. RrCCVRCGH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFCVRCGH is a flag variable that indicates whether responses to RrCCVRCGH are imputed by SHARE. RrCFCVRCGH is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFCVRCGH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCCVRCGHC indicates whether the respondent paid special attention to covering their cough or sneeze more frequently, about the same, or less frequently during the last three months, as compared to the first wave of the pandemic. RrCCVRCGHC is only available at Round 2. At Round 2, the respondent may report that they paid special attention to covering their cough or sneeze "more frequently", "less frequently", or "about the same" during the last three months, as compared to the first wave of the pandemic. RrCCVRCGHC is coded as 1 if the respondent reports that they paid special attention to covering their cough or sneeze less frequently during the last three months, as compared to the first wave of the pandemic. RrCCVRCGHC is coded as 2 if the respondent reports that they paid special attention to covering their

cough or sneeze about the same amount during the last three months, as compared to the first wave of the pandemic. RrCCVRCGHC is coded as 3 if the respondent reports that they paid special attention to covering their cough or sneeze more frequently during the last three months, as compared to the first wave of the pandemic. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCCVRCGHC is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCMEDPRV indicates whether the respondent took any drugs or medicine as prevention against COVID-19. RrCMEDPRV is coded as 0 if the respondent reports that they did not take any drugs or medicine as a prevention against COVID-19. RrCMEDPRV is coded as 1 if the respondent reports that they did take drugs or medicine as a prevention against COVID-19. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCMEDPRV is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFMEDPRV is a flag variable that indicates whether responses to RrCMEDPRV are imputed by SHARE. RrCFMEDPRV is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFMEDPRV is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCMASKF\_S indicates how often the respondent's spouse wore a face mask whenever they went outside their home to a public space. SrCMASK indicates whether the respondent's spouse wore a face mask whenever they went outside their home to a public space. SrCDISTF\_S indicates how often the respondent's spouse kept their distance from others when they went outside their home. SrCDIST indicates whether the respondent's spouse kept their distance from others when they went outside their home. SrCWASH indicates whether the respondent's spouse washed their hands or used special hand sanitizer or disinfection fluids more frequently than usual. SrCCVRCGH indicates whether the respondent's spouse paid special attention to covering their cough or sneeze. SrCCVRCGHC indicates how often the respondent's spouse paid special attention to covering their cough or sneeze compared to the first wave of the pandemic. SrCMEDPRV indicates whether the respondent's spouse took any drugs or medicine as prevention against COVID. SrCFMASKF\_S, SrCFDISTF\_S, SrCFWASH, SrCFCVRCGH, and SrCFMEDPRV are flag variables that indicate whether responses to SrCMASKF\_S, SrCDISTF\_S, SrCWASH, SrCCVRCGH, and SrCMEDPRV, respectively, are imputed by SHARE. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

Questions pertaining to the frequency that respondents wore a face mask when they went outside their home to a public space or whether respondents washed their hands or used special hand sanitizer or disinfection fluids more frequently than usual are only asked in Round 1. Thus, RrCMASKF\_S, RrCMASK, RrCFMASKF\_S, RrCWASH, and RrCFWASH are only available at Round 1.

At Round 1, respondents are asked to report how frequently they kept their distance from others when outside their home since the outbreak of Corona, while at Round 2, respondents are asked to report how frequently they took this precaution during the last three months.

At Round 1, respondents may report "yes" or "no" to whether they paid special attention to covering their cough or sneeze since the outbreak of COVID-19. At Round 2, respondent may report that they paid special attention to covering their cough and sneeze "more frequently", "less frequently", or "about the same" during the last three months, as compared to the first wave of the pandemic.

## Differences with the Harmonized HRS COVID

In the HRS COVID, respondents are asked how often they wore a face mask around other people outside their home and how often they kept their distance from others when they went outside their home. Available answer choices are "always", "sometimes", or "never". The SHARE Corona survey asks the same questions but utilizes a different response scale: "always", "often", "sometimes", or "never". Because of the difference in response scales, "\_S" is added to the end of the Gateway Harmonized SHARE COVID variables, RrCMASKF\_S and RrCDISTF\_S, to indicate that these harmonized variables in the Harmonized HRS COVID and Gateway Harmonized SHARE COVID are similar but not strictly comparable. Additionally, the timeframes

referenced in these questions are different between the HRS COVID and the SHARE Corona survey. At Round 1 of the HRS COVID and SHARE Corona survey, respondents are asked to report how frequently they took these different precautions since the beginning of the COVID-19 pandemic. At Round 2 of the HRS COVID, respondents are asked to report how frequently they took these different precautions during the first year of the pandemic (from March 2020 to March 2021). At Round 2 of the SHARE Corona survey, respondents are asked to report how frequently they took these different precautions during the last three months.

To provide variables that are comparable between the HRS COVID and SHARE Corona survey, the Harmonized HRS COVID and Gateway Harmonized SHARE COVID both contain the variables RrCMASK and RrCDIST, which are binary variables that indicate whether respondents ever wore a face mask around other people outside their home and whether respondents ever kept their distance from others when they went outside their home, respectively.

The HRS COVID also asks how often respondents washed their hands or used hand sanitizer during the pandemic, which is not asked in the SHARE Corona survey. Rather, the SHARE Corona survey asks separately whether the respondent washed their hands more often or used hand sanitizer or disinfection fluids more often. RrcWASH is available in both Harmonized COVID datasets to provide a comparable measure.

The HRS COVID does not ask whether respondents paid special attention to covering their cough and sneeze and whether respondents took any drugs or medicine as a prevention against COVID, and does not provide imputed values as part of its public release.

### Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### SHARE Variables Used:

#### Round 1 Covid-19:

|            |                                                         |
|------------|---------------------------------------------------------|
| DISTANCE   | Health: kept distance from others in public             |
| DISTANCE_F | Health: kept distance from others in public - flag      |
| MASK       | Health: wore a face mask in public                      |
| MASK_F     | Health: wore a face mask in public - flag               |
| PREVENT1   | Health: washed hands more than usual                    |
| PREVENT1_F | Health: washed hands more than usual - flag             |
| PREVENT2   | Health: used special hand sanitizer more than usual     |
| PREVENT2_F | Health: used special hand sanitizer more than usual - f |
| PREVENT3   | Health: covered coughs and sneezes more than usual      |
| PREVENT3_F | Health: covered coughs and sneezes more than usual - fl |
| PREVENT4   | Health: took drugs/medicines as prevention against COVI |
| PREVENT4_F | Health: took drugs/medicines as prevention against COVI |

#### Round 2 Covid-19:

|         |                                                         |

### How Constructed:

RrCCHLIV indicates whether the respondent changed where they live due to COVID-19. RrCCHLIV is only available at Round 1. At Round 1, respondents are asked whether they are in their usual home at the time of the interview or whether they have temporarily moved elsewhere due to COVID-19. RrCCHLIV is coded as 0 if the respondent reported that they still live in their usual home. RrCCHLIV is coded as 1 if the respondent reported that they temporarily moved elsewhere. RrCCHLIV is coded as plain missing (.) if the respondent did not participate in the current round.

RrCFCHLIV is a flag variable that indicates whether responses to RrCCHLIV are imputed by SHARE. RrCFCHLIV is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFCHLIV is coded as plain missing (.) if the respondent did not participate in the current round.

SrCCHLIV indicates whether the respondent's spouse changed where they live due to COVID-19. SrCFCHLIV is a flag variable that indicates whether responses to SrCCHLIV are imputed by SHARE. SrCCHLIV and SrCFCHLIV are taken from the spouse's values to RrCCHLIV and RrCFCHLIV, respectively. In addition to the special

missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

### **Cross Round Differences in SHARE**

Unlike Round 1, Round 2 does not ask respondents to report whether they are in their usual home at the time of the interview or if they temporarily moved elsewhere due to COVID-19.

### **Differences with the Harmonized HRS COVID**

RrCCHLIV is comparable in both the Harmonized HRS COVID and Gateway Harmonized SHARE COVID in Round 1. Unlike the SHARE Corona survey, the HRS COVID asks this question in both Rounds 1 and 2.

Unlike the SHARE Corona survey, the HRS COVID also asks respondents where they moved due to COVID-19 and whether anyone moved in with them due to COVID-19. The HRS COVID does not provide imputed values as part of its public release.

### **Comparability with the Gateway Harmonized SHARE**

No comparable variables are available in the Gateway Harmonized SHARE.

### **SHARE Variables Used:**

| 1.From prev Wave    | 21264     | 27656     |

### How Constructed:

In the SHARE Corona survey, respondents are asked to report the area where they live. Respondents may report that they live in "a big city", "the suburbs or outskirts of a big city", "a large town", "a small town", or "a rural area or village". This question is not asked at Round 1, but was collected in the main SHARE survey at Wave 8. Please note that Round 1 was conducted at the conclusion of fieldwork for Wave 8 of the main SHARE survey.

HrCRURAL indicates whether the respondent lives in a rural area. At Round 1, this variable was derived by looking at the HwRURAL variables from the Gateway Harmonized SHARE vG dataset. The first non-missing reported area of residence was always used, prioritizing responses in the following order: Wave 8, Wave 7, Wave 6, Wave 5, Wave 4, Wave 2, and Wave 1 from the Gateway Harmonized SHARE vG dataset. At Round 2, respondents are asked to describe the area where they live and can respond with "a big city", "the suburbs or outskirts of a big city", "a large town", "a small town", or "a rural area or village". HrCRURAL is coded as 0 if the respondent reported that they live in "a big city", "the suburbs or outskirts of a big city", "a large town", or "a small town". HrCRURAL is coded as 1 if the respondent reported that they live in a rural area or village. Don't know, refused, and other missing responses are coded as special missing values (.d), (.r), and (.m), respectively. HwCRURAL is coded as plain missing (.) if the respondent did not participate in the current round.

HrCFRURAL is a flag variable that indicates whether responses to HrCRURAL are taken directly from H8RURAL in Wave 8 of the main SHARE survey or derived from previous SHARE waves (Waves 1 - 7). HrCFRURAL is assigned 0 if responses are taken directly from H8RURAL in Wave 8 or reported in Round 2, and 1 if responses are derived from previous SHARE waves (Waves 1 - 7). Other missing responses are coded as special missing values (.m). HrCFRURAL is coded as plain missing (.) if the respondent did not participate in the current round.

**Cross Round Differences in SHARE**

Unlike Round 2, Round 1 does not ask respondents to report the type of area where they live. Round 1 values are taken from Wave 8 of the Gateway Harmonized SHARE where possible, and from the most recent previous wave otherwise.

**Differences with the Harmonized HRS COVID**

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents to report the type of area where they live.

**Comparability with the Gateway Harmonized SHARE**

HHrCRURAL: This variable is comparable to HwRURAL in the Gateway Harmonized SHARE.

**SHARE Variables Used:**

|                           |                                    |

**How Constructed:**

RrCSHLT indicates the respondent's self-reported general health status using a scale ranging from excellent to poor. In Round 1, RrCSHLT refers to the time before the outbreak of Corona. In Round 2, RrCSHLT presumably refers to the present time. Respondents are asked if their health is "excellent", "very good", "good", "fair", or "poor". RrCSHLT is coded as 1 if the respondent reports that their health is excellent. RrCSHLT is coded as 2 if the respondent reports that their health is very good. RrCSHLT is coded as 3 if the respondent reports that their health is good. RrCSHLT is coded as 4 if the respondent reports that their health is fair. RrCSHLT is coded as 5 if the respondent reports that their health is poor. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCSHLT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFSHLT is a flag variable that indicates whether responses to RrCSHLT are imputed by SHARE. RrCFSHLT is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFSHLT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

At Round 1, respondents are asked to report if their health has improved, worsened, or stayed about the same since the outbreak of COVID-19. At Round 2, respondents are asked to report if their health has improved, worsened, or stayed about the same in the past three months.

RrCHLTC3 indicates whether the respondent's self-reported general health status has improved, worsened, or stayed the same. RrCHLTC3 is coded as 1 if the respondent reports that their health has worsened in the specified time frame. RrCHLTC3 is coded as 2 if the respondent reports that their health has stayed about the same in the specified time frame. RrCHLTC3 is coded as 3 if the respondent reports that their health has improved in the specified time frame. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCHLTC3 is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFHLTC3 is a flag variable that indicates whether responses to RrCHLTC3 are imputed by SHARE. RrCFHLTC3 is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFHLTC3 is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCHLTHLMA indicates whether a health problem limits typical activities during at least the past six months. RrCHLTHLMA is only available at Round 2. At Round 2, respondents are provided with the following prompt: "For the past six months at least, to what extent have you been limited because of a health problem in activities people usually do". Respondents can report that a health problem "severely limited", "limited, but not severely", or "not limited" activities people usually do. RrCHLTHLMA simply recodes the original variable as a yes/no indicator. RrCHLTHLMA is coded as 0 if the respondent reports that their usual activities are not being limited by a health problem. RrCHLTHLMA is coded as 1 if the respondent reports that their usual activities are "severely limited" or "limited, but not severely". Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCHLTHLMA is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCSHLT indicates the respondent's spouse's self-reported general health status using a scale ranging from excellent to poor. SrCHLTC3 indicates whether the respondent's spouse's self-reported general health status has improved, worsened, or stayed about the same. SrCFHLTC3 is a flag variable that indicates whether responses to SrCHLTC3 are imputed by SHARE. SrCHLTHLMA indicates whether a health problem limits typical activities during at least the past six months. SrCSHLT, SrCHLTC3, SrCFHLTC3, and SrCHLTHLMA are taken from the spouse's values to RrCSHLT, RrCHLTC3, RrCFHLTC3, and RrCHLTHLMA respectively. In addition to the special missing values used in RrCSHLT, RrCHLTC3, RrCFHLTC3, and RrCHLTHLMA, SrCSHLT, SrCHLTC3, SrCFHLTC3, and SrCHLTHLMA employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

While both rounds ask respondents to report their general health status using a scale ranging from excellent to poor, Round 1 specifies a timeframe of "before the outbreak of COVID-19" while Round 2 does not include a time reference.

Unlike Round 2, Round 1 does not ask respondents to report the extent they felt limited by a health problem in typical activities during at least the past six months.

Differences with the Harmonized HRS COVID

Unlike the HRS COVID, the SHARE Corona survey asks respondents to report the extent they felt limited by a health problem in typical activities during at least the past six months and to report whether their self-reported general health status has improved, worsened, or stayed the same. The HRS COVID does not provide imputed values as part of its public release.

Comparability with the Gateway Harmonized SHARE

RrCSHLT: This variable is comparable with RwSHLT in the Gateway Harmonized SHARE.

RrCHLTHLMA: This variable is comparable with RwHLTHLMA in the Gateway Harmonized SHARE. Please note that RrCHLTHLMA in the Gateway Harmonized SHARE COVID references a time frame of at least the past six months, while RwHLTHLMA in the Gateway Harmonized SHARE does not provide a time reference.

### How Constructed:

At Round 1, respondents are asked if they were diagnosed with a major illness or health condition since their last interview. If the respondent answered yes, they are then asked whether they have any of the following illnesses or health conditions: hip fracture; diabetes or high blood sugar; high blood pressure or hypertension; a heart attacking including myocardial infarction or coronary thrombosis or any other heart problem including congestive heart failure; chronic lung disease such as chronic bronchitis or emphysema; cancer or malignant tumor, including leukemia or lymphoma, but excluding minor skin cancers; or any other illness or health condition. At Round 2, respondents are not asked if they were diagnosed with a major illness or health condition since their last interview. Instead, respondents are only asked to report whether they have any of the following illnesses or health conditions: hip fracture; diabetes or high blood sugar; high blood pressure or hypertension; a heart attacking including myocardial infarction or coronary thrombosis or any other heart problem including congestive heart failure; chronic lung disease such as chronic bronchitis or emphysema; cancer or malignant tumor, including leukemia or lymphoma, but excluding minor skin cancers; or any other illness or health condition. For comparability across the COVID surveys, we also consider any reports of the disease made during the core interviews in the creation of the following variables. Both rounds consider reports of disease through Wave 8 of the core interview, and Round 2 also considers positive reports of disease from Round 1.

RrCHIBPS indicates whether the respondent has been diagnosed with high blood pressure or hypertension since their last interview. RrCHIBPS is only coded as 1 if the respondent reported not having high blood pressure or hypertension at the last interview but now report that a doctor told them that they have developed high blood pressure or hypertension since their last interview. RrCHIBPS is coded as 0 if the respondent has never reported having high blood pressure or hypertension, or if they reported having high blood pressure or hypertension at a previous interview, regardless of a positive report during the current COVID round. At Round 1, RrCHIBPS is also coded as 0 if the respondent reports that they were not diagnosed with a major illness or health condition since their last interview, or if the respondent reports that they were diagnosed with a major illness or health condition since their last interview, but were not diagnosed with high blood pressure or hypertension. At Round 2, RrCHIBPS is also coded as 0 if the respondent reports that they currently do not have high blood pressure or hypertension. Special missing value (.c) is assigned if the respondent has not previously reported whether a doctor has ever told them that they have developed high blood pressure or hypertension so there cannot be a new report of whether a doctor has ever told them that they have developed high blood pressure or hypertension. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCHIBPS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFHIBPS is a flag variable that indicates whether responses to RrCHIBPS are imputed by SHARE. RrCFHIBPS is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFHIBPS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCDIABS indicates whether the respondent has been diagnosed with diabetes or high blood sugar since their last interview. RrCDIABS is only coded as 1 if the respondent reported not having diabetes or high blood sugar at the last interview but now report that a doctor told them that they have developed diabetes or high blood sugar since their last interview. RrCDIABS is coded as 0 if the respondent has never reported having diabetes or high blood sugar, or if they reported having diabetes or high blood sugar at a previous interview, regardless of a positive report during the current COVID round. At Round 1, RrCDIABS is also coded as 0 if the respondent reports that they were not diagnosed with a major illness or health condition since their last interview, or if the respondent reports that they were diagnosed with a major illness or health condition since their last interview, but were not diagnosed with diabetes or high blood sugar. At Round 2, RrCDIABS is also coded as 0 if the respondent reports that they currently do not have diabetes or high blood sugar. Special missing value (.c) is assigned if the respondent has not previously reported whether a doctor has ever told them that they have developed diabetes or high blood sugar so there cannot be a new report of whether a doctor has ever told them that they have developed diabetes or high blood sugar. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDIABS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFDIABS is a flag variable that indicates whether responses to RrCDIABS are imputed by SHARE. RrCFDIABS is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFDIABS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCCANCERS indicates whether the respondent has been diagnosed with cancer or a malignant tumor, including leukemia or lymphoma, but excluding minor skin cancers since their last interview. RrCCANCERS is only coded as 1 if the respondent reported not having cancer or a malignant tumor at the last interview but now report that a doctor told them that they have developed cancer or a malignant tumor since their last interview. RrCCANCERS is coded as 0 if the respondent has never reported having cancer or a malignant tumor, or if they reported having cancer or a malignant tumor at a previous interview, regardless of a positive report during the current COVID round. At Round 1, RrCCANCERS is also coded as 0 if the respondent reports that they were not diagnosed with a major illness or health condition since their last interview, or if the respondent reports that they were diagnosed with a major illness or health condition since their last interview, but were not diagnosed with cancer or a malignant tumor. At Round 2, RrCCANCERS is also coded as 0 if the respondent reports that they currently do not have cancer or a malignant tumor. Special missing value (.c) is assigned if the respondent has not previously reported whether a doctor has ever told them that they have developed cancer or a malignant tumor so there cannot be a new report of whether a doctor has ever told them that they have developed cancer or a malignant tumor. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCCANCERS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFCANCERS is a flag variable that indicates whether responses to RrCCANCERS are imputed by SHARE. RrCFCANCERS is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFCANCERS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCLUNGS indicates whether the respondent has been diagnosed with chronic lung disease such as chronic bronchitis or emphysema since their last interview. RrCLUNGS is only coded as 1 if the respondent reported not having chronic lung disease at the last interview but now report that a doctor told them that they have developed chronic lung disease since their last interview. RrCLUNGS is coded as 0 if the respondent has never reported having chronic lung disease, or if they reported having chronic lung disease at a previous interview, regardless of a positive report during the current COVID round. At Round 1, RrCLUNGS is also coded as 0 if the respondent reports that they were not diagnosed with a major illness or health condition since their last interview, or if the respondent reports that they were diagnosed with a major illness or health condition since their last interview, but were not diagnosed with chronic lung disease. At Round 2, RrCLUNGS is also coded as 0 if the respondent reports that they currently do not have chronic lung disease. Special missing value (.c) is assigned if the respondent has not previously reported whether a doctor has ever told them that they have developed chronic lung disease so there cannot be a new report of whether a doctor has ever told them that they have developed chronic lung disease. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCLUNGS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFLUNGS is a flag variable that indicates whether responses to RrCLUNGS are imputed by SHARE. RrCFLUNGS is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFLUNGS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCHEARTS indicates whether the respondent has been diagnosed with a heart attack including myocardial infarction or coronary thrombosis or any other heart problem including congestive heart failure since their last interview. RrCHEARTS is only coded as 1 if the respondent reported not having a heart attack or any other heart problem at the last interview but now report that a doctor told them that they had a heart attack or have developed any other heart problem since their last interview. RrCHEARTS is coded as 0 if the respondent has never reported having a heart attack or any other heart problem, or if they reported having a heart attack or any other heart problem at a previous interview, regardless of a positive report during the current COVID round. At Round 1, RrCHEARTS is also coded as 0 if the respondent reports that they were not diagnosed with a major illness or health condition since their last interview, or if the respondent reports that they were diagnosed with a major illness or health condition since their last interview, but were not diagnosed with a heart attack or any other heart problem. At Round 2, RrCHEARTS is also coded as 0 if the respondent reports that they currently do not have a heart problem. Special missing value (.c) is assigned if the respondent has not previously reported whether a doctor has ever told them that they had heart attack or developed any other heart problem so there cannot be a new report of whether a doctor has ever told them that they had a heart attack or developed any other heart problem. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCHEARTS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFHEARTS is a flag variable that indicates whether responses to RrCHEARTS are imputed by SHARE. RrCFHEARTS is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFHEARTS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCHIPS indicates whether the respondent has been diagnosed with a hip fracture since their last interview. RrCHIPS is only coded as 1 if the respondent reported not having a hip fracture at the last interview but now report that a doctor told them that they have developed a hip fracture since their last interview. RrCHIPS is coded as 0 if the respondent has never reported having a hip fracture, or if they reported having a hip fracture at a previous interview, regardless of a positive report during the current COVID round. At Round 1, RrCHIPS is also coded as 0 if the respondent reports that they were not diagnosed with a major illness or health condition since their last interview, or if the respondent reports that they were diagnosed with a major illness or health condition since their last interview, but were not diagnosed with a hip fracture. At Round 2, RrCHIPS is also coded as 0 if the respondent reports that they currently do not have a hip fracture. Special missing value (.c) is assigned if the respondent has not previously reported whether a doctor has ever told them that they have developed a hip fracture so there cannot be a new report of whether a doctor has ever told them that they have developed a hip fracture. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCHIPS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFHIPS is a flag variable that indicates whether responses to RrCHIPS are imputed by SHARE. RrCFHIPS is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFHIPS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCHIBPS indicates whether the respondent's spouse has been diagnosed with high blood pressure or hypertension since their last interview. SrCDIABS indicates whether the respondent's spouse has been diagnosed with diabetes or high blood sugar since their last interview. SrCCANCERS indicates whether the respondent's spouse has been diagnosed with cancer or a malignant tumor, including leukemia or lymphoma, but excluding minor skin cancers since their last interview. SrCLUNGS indicates whether the respondent's spouse has been diagnosed with chronic lung disease such as chronic bronchitis or emphysema since their last interview. SrCHEARTS indicates whether the respondent's spouse has been diagnosed with a heart attack including myocardial infarction or coronary thrombosis or any other heart problem including congestive heart failure since their last interview. SrCHIPS indicates whether the respondent's spouse has been diagnosed with a hip fracture since their last interview. SrCFHIBPS, SrCFDIABS, SrCFCANCERS, SrCFLUNGS, SrCFHEARTS, and SrCFHIPS are flag variables that indicate whether responses to SrCHIBPS, SrCDIABS, SrCCANCERS, SrCLUNGS, SrCHEARTS, and SrCHIPS, respectively, are imputed by SHARE. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special

missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

No differences known.

## Differences with the Harmonized HRS COVID

Like the SHARE Corona survey, the HRS COVID asks respondents to report whether they have been diagnosed with high blood pressure, diabetes, cancer, chronic lung disease, or a heart problem since the last interview they responded to. The HRS COVID also asks additional health conditions that are not surveyed in the SHARE Corona survey. These include stroke, arthritis, Alzheimer's disease, and dementia. Thus, the Harmonized HRS COVID includes RrCSTROKS, RrCARTHRS, RrCALZHS, and RrCDEMENS, respectively, which are not provided in the Gateway Harmonized SHARE COVID. The SHARE Corona survey also asks respondents to report whether they have been diagnosed with a hip fracture since their last interview. Thus, the Gateway Harmonized SHARE COVID includes RrCHIPS, which is not provided in the Harmonized HRS COVID. The HRS COVID does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

RrCHIBPS: This variable is related to RwhIBPE, which indicates whether the respondent was ever diagnosed with high blood pressure, in the Gateway Harmonized SHARE, which includes other related variables.

RrCDIABS: This variable is related to RwdIABE, which indicates whether the respondent was ever diagnosed with diabetes, in the Gateway Harmonized SHARE, which also includes other related variables.

RrCCANCERS: This variable is comparable to RwcANCRC in the Gateway Harmonized SHARE, which also includes RwcANCRC, which indicates whether the respondent was ever diagnosed with cancer, and other related variables.

RrCLUNGS: This variable is related to RwcLUNGE, which indicates whether the respondent was ever diagnosed with lung disease, in the Gateway Harmonized SHARE, which also includes other related variables.

RrCHEARTS: This variable is related to RwhRTATT, which indicates whether the respondent reports having a heart attack since the last interview, and RwhEARTE, which indicates whether the respondent reported ever having heart problems, in the Gateway Harmonized SHARE, which also includes other related variables.

RrCHIPS: This variable is comparable to RwhIP in the Gateway Harmonized SHARE, which also includes RrHIPE, which indicates whether the respondent has ever had a hip fracture, and other related variables.

## SHARE Variables Used:

How Constructed:

RrCFLUSHT1Y indicates whether the respondent has received a flu vaccination in the last 12 months. RrCFLUSHT1Y is only available at Round 2. RrCFLUSHT1Y is coded as 0 if the respondent reports that they have not received a flu vaccination in the last 12 months. RrCFLUSHT1Y is coded as 1 if the respondent reports that they have received a flu vaccination in the last 12 months. Don't know, refused, and missing

responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCFLUSHT1Y is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCPNEUSHT6Y indicates whether the respondent has received a pneumonia vaccination (a pneumococcal vaccine) within the last six years. RrCPNEUSHT6Y is only available at Round 2. RrCPNEUSHT6Y is coded as 0 if the respondent reports that they have not received a pneumonia vaccination within the last six years. RrCPNEUSHT6Y is coded as 1 if the respondent reports that they have received a pneumonia vaccination within the last six years. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCPNEUSHT6Y is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCFLUSHT1Y indicates whether the respondent's spouse has received a flu vaccination in the last 12 months. SrCPNEUSHT6Y indicates whether the respondent's spouse has received a pneumococcal vaccination (a pneumococcal vaccine) within the last six years. SrCFLUSHT1Y and SrCPNEUSHT6Y are taken from the spouse's values to RrCFLUSHT1Y and RrCPNEUSHT6Y. In addition to the special missing values used in RrCFLUSHT1Y and RrCPNEUSHT6Y, SrCFLUSHT1Y and SrCPNEUSHT6Y employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

Round 1 does not ask respondents to report whether they have received a flu vaccination in the last 12 months or whether they have received a pneumonia vaccination (a pneumococcal vaccine) within the last six years.

## Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents to report whether they have received a flu vaccination in the last 12 months or a pneumonia vaccination (a pneumococcal vaccine) within the last six years.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

How Constructed:

RrCFALL\_S indicates whether in the past six months (at least), the respondent has been bothered by falling down. RrCFALL\_S is coded as 0 if the respondent reports that they have not been bothered by falling down in the past six months (at least). RrCFALL\_S is coded as 1 if the respondent reports that they have been bothered by falling down in the past six months (at least). Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCFALL\_S is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFALL\_S is a flag variable that indicates whether responses to RrCFALL\_S are imputed by SHARE. RrCFALL\_S is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFALL\_S is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCFALL\_S indicates whether the respondent's spouse has been bothered by falling down in the past six months (at least). SrCFALL\_S is a flag variable that indicates whether responses to SrCFALL\_S are imputed by SHARE. SrCFALL\_S and SrCFALL\_S are taken from the spouse's values to RrCFALL\_S and RrCFALL\_S, respectively. In addition to the special missing values used in RrCFALL\_S and RrCFALL\_S, SrCFALL\_S and SrCFALL\_S employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

### **Cross Round Differences in SHARE**

No differences known.

### **Differences with the Harmonized HRS COVID**

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents to report whether they have been bothered by falling down in the past six months (at least).

### **Comparability with the Gateway Harmonized SHARE**

RrCFALL\_S: This variable is comparable to RrFALL\_S in the Gateway Harmonized SHARE.

### **SHARE Variables Used:**

#### **Round 1 Covid-19:**

|           |                                                         |

### How Constructed:

At Round 1, respondents are asked separately to indicate whether they had forgone medical treatment because they were afraid of being infected by COVID-19, whether they had a scheduled medical appointment that was postponed by the doctor or medical facility due to COVID-19, and whether they had asked to make a medical appointment but did not get one since the outbreak of COVID-19. At Round 2, respondents are asked separately to indicate whether they had forgone medical treatment because they were afraid of being infected by COVID-19, whether they had a scheduled medical appointment that was postponed by the doctor or medical facility due to COVID-19, and whether they had asked to make a medical appointment but did not

get one since their last interview (since July 2020). At Rounds 1 and 2, if the respondent answered yes to any of these three questions, they are then asked to report the medical treatment that they have forgone, postponed, or did not receive an appointment for during the pandemic. Types of medical treatments include a check-up at a general practitioner; a check-up at a specialist, including a dentist; a planned medical treatment, including an operation; physiotherapy, psychotherapy, or rehabilitation; and some other type of medical treatment.

RrCDLYCARE indicates whether the respondent forwent medical treatment, had a scheduled medical appointment that was postponed, or was denied a medical treatment appointment during the pandemic. RrCDLYCARE is coded as 0 if the respondent reports that they did not forgo a medical treatment, did not have a scheduled medical appointment that was postponed, or were not denied a medical treatment appointment during the pandemic. RrCDLYCARE is coded as 1 if the respondent reports that they forwent a medical treatment, had a scheduled medical appointment that was postponed, or were denied a medical treatment appointment during the pandemic. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDLYCARE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFDLYCARE is a flag variable that indicates whether responses to RrCDLYCARE are imputed by SHARE. RrCFDLYCARE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFDLYCARE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCDLYSURG indicates whether the respondent forwent a planned medical treatment, including an operation; had a scheduled planned medical treatment, including an operation, postponed; or was denied an appointment for a planned medical treatment, including an operation, during the pandemic. RrCDLYSURG is coded as 0 if the respondent reports that they did not forgo a planned medical treatment, including an operation; did not have a scheduled planned medical treatment, including an operation, postponed; or were not denied an appointment for a planned medical treatment, including an operation, during the pandemic. RrCDLYSURG is coded as 1 if the respondent reports that they forwent a planned medical treatment, including an operation; had a scheduled planned medical treatment, including an operation, postponed; or were denied an appointment for a planned medical treatment, including an operation, during the pandemic. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDLYSURG is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFDLYSURG is a flag variable that indicates whether responses to RrCDLYSURG are imputed by SHARE. RrCFDLYSURG is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFDLYSURG is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCDLYDOC indicates whether the respondent forwent a check-up with a general practitioner, had a scheduled check-up with a general practitioner postponed, or was denied an appointment for a check-up with a general practitioner during the pandemic. RrCDLYDOC is coded as 0 if the respondent reports that they did not forgo a check-up with a general practitioner, did not have a scheduled check-up with a general practitioner postponed, or were not denied an appointment for a check-up with a general practitioner during the pandemic. RrCDLYDOC is coded as 1 if the respondent reports that they forwent a check-up with a general practitioner, had a scheduled check-up with a general practitioner postponed, or were denied an appointment for a check-up with a general practitioner during the pandemic. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDLYDOC is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFDLYDOC is a flag variable that indicates whether responses to RrCDLYDOC are imputed by SHARE. RrCFDLYDOC is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFDLYDOC is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCDLYOTH indicates whether the respondent forwent any other type of medical treatment, had a scheduled appointment for any other medical treatment postponed, or was denied an appointment for any other type of medical treatment during the pandemic. Such medical treatments include a check-up at a specialist, including a dentist; physiotherapy, psychotherapy, or rehabilitation; or some other type of medical treatment. RrCDLYOTH is coded as 0 if the respondent reports that they did not forgo any other type of medical treatment, did not have a scheduled appointment for any other type of medical treatment

postponed, or were not denied an appointment for any other type of medical treatment during the pandemic. RrCDLYOTH is coded as 1 if the respondent reports that they forwent any other type of medical treatment, did have a scheduled appointment for any other type of medical treatment postponed, or were denied an appointment for any other type of medical treatment during the pandemic. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDLYOTH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFDLYOTH is a flag variable that indicates whether responses to RrCDLYOTH are imputed by SHARE. RrCFDLYOTH is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFDLYOTH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCDLYCARE indicates whether the respondent's spouse forwent medical treatment, had a scheduled medical appointment that was postponed, or was denied a medical treatment appointment during the pandemic. SrCFDLYCARE is a flag variable that indicates whether responses to SrCDLYCARE are imputed by SHARE. SrCDLYSURG indicates whether the respondent's spouse forwent a planned medical treatment, including an operation; had a scheduled planned medical treatment, including an operation, postponed; or was denied an appointment for a planned medical treatment, including an operation, during the pandemic. SrCFDLYSURG is a flag variable that indicates whether responses to SrCDLYSURG are imputed by SHARE. SrCDLYDOC indicates whether the respondent's spouse forwent a check-up with a general practitioner, had a scheduled check-up with a general practitioner postponed, or was denied an appointment for a check-up with a general practitioner during the pandemic. SrCFDLYDOC is a flag variable that indicates whether responses to SrCDLYDOC are imputed by SHARE. SrCDLYOTH indicates whether the respondent's spouse forwent any other type of medical treatment, had a scheduled appointment for any other type of medical treatment postponed, or was denied an appointment for any other type of medical treatment during the pandemic. SrCFDLYOTH is a flag variable that indicates whether responses to SrCDLYOTH are imputed by SHARE. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked separately to indicate whether they have forgone medical treatment because they were afraid of being infected by COVID-19, whether they have a scheduled medical appointment that was postponed by the doctor or medical facility due to COVID-19, and whether they have asked to make a medical appointment but did not get one since the outbreak of COVID-19. At Round 2, respondents are asked separately to indicate whether they have forgone medical treatment because they were afraid of being infected by COVID-19, whether they have a scheduled medical appointment that was postponed by the doctor or medical facility due to COVID-19, and whether they have asked to make a medical appointment but did not get one since their last interview (since July 2020). As a result, it is possible that the time periods referenced in these questions may overlap for some respondents.

## Differences with the Harmonized HRS COVID

In the HRS COVID, respondents are asked if they delayed or did not get needed medical or dental care since the beginning of the coronavirus pandemic. If the respondent reports that they delayed or did not get needed medical or dental care, they are then asked if they delayed or did not get surgery, see the doctor (including a telemedicine visit), fill a prescription, get dental care, or get any other types of care.

In the SHARE Corona survey, respondents are asked in separate questions to indicate whether they had forgone medical treatment because they were afraid of being infected by COVID-19, whether they had a scheduled medical appointment that was postponed by the doctor or medical facility due to COVID-19, or whether they had asked to make a medical appointment but did not get one since the outbreak of COVID-19. If they answered yes to any of these three questions, they were asked to indicate the medical treatment that they had forgone, was postponed, or they did not receive an appointment for. Types of medical treatments include a check-up at a general practitioner; a check-up at a specialist, including a dentist; a planned medical treatment, including an operation; physiotherapy, psychotherapy, or rehabilitation; and some other type of medical treatment.

Unlike the HRS COVID, the SHARE Corona survey does not ask respondents whether they delayed or did not fill a prescription or get dental care since the beginning of the COVID-19 pandemic. As such, the Harmonized HRS COVID includes RrCDLYRX and RrCDLYDEN, which are not available in the Gateway Harmonized SHARE COVID. Despite the differences in question wording, RrCDLYSURG, RrCDLYDOC, and RrCDLYOTH are comparable between the Harmonized HRS COVID and Gateway Harmonized SHARE COVID. RrCDLYCARE could include difficulty filling a prescription in the Harmonized HRS COVID, while it would not in the Gateway Harmonized SHARE COVID, but these variables are otherwise comparable. The HRS COVID does not provide imputed values as part of its public release.

In Round 2 of the HRS COVID, respondents are asked about delayed medical care since the beginning of the outbreak in March 2020, likely overlapping with any report of delayed care in the first round. In Round 2 of the SHARE COVID, respondents are asked about forgone, postponed, or denied medical care since their last COVID interview or July 2020, intended to be separate from any report of delayed care in the first round.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### How Constructed:

At Round 2, respondents are asked separately to indicate whether they had forgone medical treatment because they were afraid of being infected by COVID-19, whether they had a scheduled medical appointment that was postponed by the doctor or medical facility due to COVID-19, and whether they had asked to make a medical appointment but did not get one since their last interview (since July 2020). If the respondent answered yes to any of these three questions, they are then asked to report the medical treatment that they have forgone, postponed, or did not receive an appointment for during the pandemic. Types of medical treatments include a check-up at a general practitioner; a check-up at a specialist, including a dentist; a planned medical treatment, including an operation; physiotherapy, psychotherapy, or rehabilitation; and some other type of medical treatment. Respondents are additionally asked to report whether they have had their deferred appointment or treatment by the time of their current interview.

RrCDLYSURGA indicates whether the respondent received a planned medical treatment, including an operation, that they had previously forwent, postponed, or been denied during the pandemic. RrCDLYSURGA is only available at Round 2. RrCDLYSURGA is coded as 0 if the respondent reports that they did not receive a planned medical treatment, including an operation, that they had previously forwent, postponed, or been denied during the pandemic. RrCDLYSURGA is coded as 1 if the respondent reports that they ended up receiving a planned medical treatment, including an operation, that they had previously forwent, postponed, or been denied during the pandemic. Special missing value (.n) is assigned if the respondent reports that they had never previously forwent, postponed, or been denied from receiving a planned medical treatment, including an operation, during the pandemic. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDLYSURGA is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCDLYDOCA indicates whether the respondent had a check-up with a general practitioner that they had previously forwent, postponed, or been denied during the pandemic. RrCDLYDOCA is only available at Round 2. RrCDLYDOCA is coded as 0 if the respondent reports that they did not have a check-up with a general practitioner that they had previously forwent, postponed, or been denied during the pandemic. RrCDLYDOCA is coded as 1 if the respondent reports that they ended up having a check-up with a general practitioner that they had previously forwent, postponed, or been denied during the pandemic. Special missing value (.n) is assigned if the respondent reports that they had never previously forwent, postponed, or been denied from a check-up with a general practitioner during the pandemic. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDLYDOCA is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCDLYOTHA indicates whether the respondent received any other type of medical treatment that they had previously forwent, postponed, or been denied during the pandemic. Such medical treatments include a check-up at a specialist, including a dentist; physiotherapy, psychotherapy, or rehabilitation; or some other type of medical treatment. RrCDLYOTHA is only available at Round 2. RrCDLYOTHA is coded as 0 if the respondent reports that they did not receive any other type of medical treatment that they had previously forwent, postponed, or been denied during the pandemic. RrCDLYSURGA is coded as 1 if the respondent reports that they ended up receiving any other type of medical treatment that they had previously forwent, postponed, or been denied during the pandemic. Special missing value (.n) is assigned if the

respondent reports that they had never previously forwent, postponed, or been denied from receiving other types of medical treatment during the pandemic. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDLYDOCA is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCDLYSURGA indicates whether the respondent's spouse received a planned medical treatment, including an operation, that they had previously forwent, postponed, or been denied during the pandemic. SrCDLYDOCA indicates whether the respondent's spouse had a check-up with a general practitioner that they had previously forwent, postponed, or been denied during the pandemic. SrCDLYOTHA indicates whether the respondent's spouse received an other type of medical treatment that they had previously forwent, postponed, or been denied during the pandemic. SrCDLYSURGA, SrCDLYDOCA, and SrCDLYOTHA are taken from the spouse's values to the RrCDLYSURGA, RrCDLYDOCA, and RrCDLYOTHA, respectively. In addition to the special missing values used in RrCDLYSURGA, RrCDLYDOCA, and RrCDLYOTHA, SrCDLYSURGA, SrCDLYDOCA, and SrCDLYOTHA employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

### Cross Round Differences in SHARE

Unlike Round 1, Round 2 asks respondents to report whether they have received a planned medical treatment, including an operation, that they had previously forwent, postponed, or been denied during the pandemic; whether they have had check-up with a general practitioner that they had previously forwent, postponed, or been denied during the pandemic; and whether they have received any other type of medical treatment that they had previously forwent, postponed, or been denied during the pandemic.

### Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents whether they have had their deferred appointment or treatment by the time of their current interview.

### Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### How Constructed:

At Round 1, respondents are asked to report whether they were treated in a hospital since the outbreak of COVID-19. At Round 2, respondents are asked to report whether they were treated in a hospital since their last interview (since July 2020). At Rounds 1 and 2, if the respondent reports that they have been treated in a hospital during the pandemic, they are then asked to report how satisfied they were with the way they were treated on a scale of very satisfied to very dissatisfied.

RrCHOSP indicates whether the respondent has been treated in a hospital during the COVID-19 pandemic. RrCHOSP is coded as 0 if the respondent reports that they were not treated in a hospital during the pandemic. RrCHOSP is coded as 1 if the respondent reports that they were treated in a hospital during the pandemic. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCHOSP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFHOSP is a flag variable that indicates whether responses to RrCHOSP are imputed by SHARE. RrCFHOSP is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFHOSP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCHOSPSAT indicates how satisfied the respondent was with the way that they were treated in the hospital during the COVID-19 pandemic. RrCHOSPSAT is coded as 1 if the respondent reports that they were very dissatisfied with the way that they were treated in the hospital during the pandemic. RrCHOSPSAT is coded as 2 if the respondent reports that they were somewhat dissatisfied with the way that they were treated in the hospital during the pandemic. RrCHOSPSAT is coded as 3 if the respondent reports that they were

somewhat satisfied with the way that they were treated in the hospital during the pandemic. RrCHOSPSAT is coded as 4 if the respondent reports that they were very satisfied with the way that they were treated in the hospital during the pandemic. Special missing value (.n) is assigned if the respondent reports that they were not treated in a hospital during the pandemic. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCHOSPSAT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrcFHOSPSAT is a flag variable that indicates whether responses to RrCHOSPSAT are imputed by SHARE. RrcFHOSPSAT is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrcFHOSPSAT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCHOSP indicates whether the respondent's spouse was treated in a hospital during the pandemic. SrCFHOSP is a flag variable that indicates whether responses to SrCHOSP are imputed by SHARE. SrCHOSPSAT indicates how satisfied the respondent's spouse was with the way that they were treated in the hospital during the pandemic. SrCFHOSPSAT is a flag variable that indicates whether responses to SrCHOSPSAT are imputed by SHARE. SrCHOSP, SrCFHOSP, SrCHOSPSAT, and SrCFHOSPSAT are taken from the spouse's values to RrCHOSP, RrcFHOSP, RrCHOSPSAT, and RrcFHOSPSAT, respectively. In addition to the special missing values used in RrCHOSP, RrcFHOSP, RrCHOSPSAT, and RrcFHOSPSAT, SrCHOSP, SrCFHOSP, SrCHOSPSAT, and SrCFHOSPSAT employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked to report whether they were treated in a hospital since the outbreak of COVID-19. At Round 2, respondents are asked to report whether they were treated in a hospital since their last interview (since July 2020).

## Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents whether they were treated in a hospital during the pandemic. Additionally, the HRS COVID does not ask respondents to report how satisfied they were with the way that they were treated in the hospital during the pandemic. As such, the Gateway Harmonized SHARE COVID includes RrCHOSP and RrCHOSPSAT, which are not available in the HRS COVID. The HRS COVID does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

## SHARE Variables Used:

### Round 1 Covid-19:

|            |                                                       |
|------------|-------------------------------------------------------|
| THOSP      | Healthcare: treated in hospital since outbreak        |
| THOSPSAT   | Healthcare: satisfaction with treatment in hospital   |
| THOSPSAT_F | Healthcare: satisfaction with treatment in hospital - |
| THOSP_F    | Healthcare: treated in hospital since outbreak - flag |

### Round 2 Covid-19:

|         |                                                         |
|---------|---------------------------------------------------------|
| CAQ125_ | Healthcare: treated in hospital since last interview/Ju |
| CAQ127_ | Healthcare: satisfaction with treatment in hospital     |

Doctor Visit

### How Constructed:

At Round 1, respondents are asked to report whether they went to a doctor's office or a medical facility other than a hospital since the outbreak of COVID-19. At Round 2, respondents are asked to report whether

they went to a doctor's office or a medical facility other than a hospital since their last interview (since July 2020). At Rounds 1 and 2, if the respondent reports that they went to a doctor's office or a medical facility other than a hospital during the pandemic, they are then asked to report how satisfied they were with the way they were treated on a scale of very satisfied to very dissatisfied.

RrCDOCTOR indicates whether the respondent has gone to a doctor's office or a medical facility other than a hospital during the COVID-19 pandemic. RrCHOSP is coded as 0 if the respondent reports that they did not go to a doctor's office or a medical facility other than a hospital during the pandemic. RrCHOSP is coded as 1 if the respondent reports that they went to a doctor's office or a medical facility other than a hospital during the pandemic. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDOCTOR is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFDOCTOR is a flag variable that indicates whether responses to RrCDOCTOR are imputed by SHARE. RrCFDOCTOR is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFDOCTOR is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCDOCTORSAT indicates how satisfied the respondent was with the way that they were treated at a doctor's office or a medical facility other than a hospital during the COVID-19 pandemic. RrCDOCTORSAT is coded as 1 if the respondent reports that they were very dissatisfied with the way that they were treated at a doctor's office or a medical facility other than a hospital during the pandemic. RrCHOSPSAT is coded as 2 if the respondent reports that they were somewhat dissatisfied with the way that they were treated at a doctor's office or a medical facility other than a hospital during the pandemic. RrCHOSPSAT is coded as 3 if the respondent reports that they were somewhat satisfied with the way that they were treated at a doctor's office or a medical facility other than a hospital during the pandemic. RrCHOSPSAT is coded as 4 if the respondent reports that they were very satisfied with the way that they were treated at a doctor's office or a medical facility other than a hospital during the pandemic. Special missing value (.n) is assigned if the respondent reports that they were not treated at a doctor's office or a medical facility other than a hospital during the pandemic. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCDOCTORSAT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFDOCTORSAT is a flag variable that indicates whether responses to RrCDOCTORSAT are imputed by SHARE. RrCFDOCTORSAT is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFDOCTORSAT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

At Round 2, respondents are also asked to report the number of remote medical consultations that they had over the phone, computer, or any other electronic means with or without video since the outbreak of COVID-19.

RrCEDOCTOR indicates whether the respondent had a doctor visit through electronic means since the outbreak of COVID-19. RrCEDOCTOR is only available at Round 2. RrCEDOCTOR is coded as 0 if the respondent reports that they had zero remote medical consultations over the phone, computer, or any other electronic means with or without video during the pandemic. RrCEDOCTOR is coded as 1 if the respondent reports that they had at least one remote medical consultation over the phone, computer, or any other electronic means with or without video during the pandemic. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCEDOCTOR is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCDOCTOR indicates whether the respondent's spouse went to a doctor's office or a medical facility other than a hospital during the pandemic. SrCFDOCTOR is a flag variable that indicates whether responses to SrCDOCTOR are imputed by SHARE. SrCDOCTORSAT indicates how satisfied the respondent's spouse was with the way that they were treated at a doctor's office or a medical facility other than a hospital during the pandemic. SrCFDOCTORSAT is a flag variable that indicates whether responses to SrCDOCTORSAT are imputed by SHARE. SrCEDOCTOR indicates whether the respondent's spouse had a doctor visit through electronic means during the pandemic. SrCDOCTOR, SrCFDOCTOR, SrCDOCTORSAT, SrCFDOCTORSAT, and SrCEDOCTOR are taken from the spouse's values to RrCDOCTOR, RrCFDOCTOR, RrCDOCTORSAT, RrCFDOCTORSAT, and RrCEDOCTOR, respectively. In addition to the special missing values used in RrCDOCTOR, RrCFDOCTOR, RrCDOCTORSAT, RrCFDOCTORSAT, and RrCEDOCTOR, SrCDOCTOR, SrCFDOCTOR, SrCDOCTORSAT, SrCFDOCTORSAT, and SrCEDOCTOR employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not

report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

### Cross Round Differences in SHARE

At Round 1, respondents are asked to report whether they were treated in a doctor's office or a medical facility other than a hospital since the outbreak of COVID-19. At Round 2, respondents are asked to report whether they were treated in a doctor's office or a medical facility other than a hospital since their last interview (since July 2020).

Unlike Round 2, Round 1 does not ask respondents to report the number of remote medical consultations over the phone, computer, or any other electronic means with or without video that they had since the outbreak of COVID-19.

### Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents whether they went to a doctor's office or a medical facility other than a hospital during the pandemic. Additionally, the HRS COVID does not ask respondents to report how satisfied they were with the way that they were treated in the doctor's office or medical facility other than a hospital during the pandemic. As such, the Gateway Harmonized SHARE COVID includes RrCDOCTOR and RrCDOCTORSAT, which are not available in the HRS COVID.

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents to report the number of remote medical consultations over the phone, computer, or any other electronic means with or without video that they had since the outbreak of COVID-19. Instead, the HRS COVID asks respondents to report whether they have had a telephone or video visit with a doctor instead of an in-person visit with a doctor since the beginning of the pandemic. Despite the differences in question wording, RrCEDOCTOR is comparable between the Harmonized HRS COVID and Gateway Harmonized SHARE COVID. The HRS COVID also asks respondents to report how likely they are to use telephone or video visits with a doctor in the future, which is not asked in the SHARE Corona survey.

The HRS COVID does not provide imputed values as part of its public release.

### Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### SHARE Variables Used:

#### Round 1 Covid-19:

|           |                                                         |

### How Constructed:

At Round 1, respondents are asked to report their household's overall monthly income, after taxes and contributions, for a typical month before the COVID-19 pandemic started. Respondents were also asked to report their household's lowest overall monthly income including financial support, after taxes and contributions, since the outbreak of COVID-19.

At Round 2, respondents are first asked to report whether their monthly household income has stayed the same every month since their last interview (since July 2020). If they report that their monthly household income has not stayed the same every month, they are then asked to report their household's

highest overall monthly income including financial support, after taxes and contributions, since their last interview (since July 2020). They are also asked to report their household's lowest overall monthly income including financial support, after taxes and contributions, since their last interview (since July 2020).

HHrCIBFCOV indicates the respondent's household's overall monthly income, after taxes and contributions, for a typical month before the beginning of the COVID-19 pandemic. HHrCIBFCOV is only available at Round 1. HHrCIBFCOV is coded as plain missing (.) if the respondent did not participate in the current COVID round.

HHrCIBFCOV is a flag variable that indicates whether responses to RrCIBFCOV are imputed by SHARE. HHrCIBFCOV is only available at Round 1, and is assigned 0 if responses are not imputed, 1 if responses are imputed, and 2 if responses are imputed because they are not the designated respondent for the household. HHrCIBFCOV is coded as plain missing (.) if the respondent did not participate in the current COVID round.

HHrCISAMEM indicates whether the respondent's household's monthly income has stayed the same every month since their last interview (since July 2020). HHrCISAMEM is only available at Round 2. HHrCISAMEM is coded as 0 if the respondent reports that their household's monthly income has changed since their last interview. HHrCISAMEM is coded as 1 if the respondent reports that their household's monthly income has stayed the same every month since their last interview. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. HHrCISAMEM is coded as plain missing (.) if the respondent did not participate in the current COVID round.

HHrCILOWM indicates the respondent's household's lowest overall monthly income including financial support, after taxes and contributions, during the COVID-19 pandemic. At Round 1, the timeframe refers to the beginning of the COVID-19 pandemic, and at Round 2, the timeframe refers to since their last interview (since July 2020). In Round 2, special missing value (.s) is assigned if this question was skipped because the respondent reports that their household's monthly income has stayed the same every month since their last interview. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. HHrCILOWM is coded as plain missing (.) if the respondent did not participate in the current COVID round.

HHrCIFLOWM is a flag variable that indicates whether responses to HHrCILOWM are imputed by SHARE. HHrCIFLOWM is only available at Round 1, and is assigned 0 if responses are not imputed, 1 if responses are imputed, and 2 if responses are imputed because they are not the designated respondent for the household. HHrCIFLOWM is coded as plain missing (.) if the respondent did not participate in the current COVID round.

HHrCIHIGHM indicates the respondent's household's highest overall monthly income including financial support, after taxes and contributions, since their last interview (July 2020). HHrCIHIGHM is only available at Round 2. Special missing value (.s) is assigned if this question was skipped because the respondent reports that their household's monthly income has stayed the same every month since their last interview. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. HHrCIHIGHM is coded as plain missing (.) if the respondent did not participate in the current COVID round.

## Cross Round Differences in SHARE

Unlike Round 1, Round 2 does not ask respondents to report their household's overall monthly income, after taxes and contributions, for a typical month before the beginning of the COVID-19 pandemic. For this reason, HHrCIBFCOV is not available at Round 2.

Unlike Round 2, Round 1 does not ask respondents to report whether their household's monthly income has stayed the same every month since their last interview. Round 1 also does not ask respondents to report their household's highest overall monthly income including financial support, after taxes and contributions, since their last interview. For these reasons, HHrCISAMEM and HHrCIHIGHM are not available at Round 1.

At Round 1, respondents are asked to report the lowest overall monthly income, after taxes and contributions, that their entire household had, including any financial support that they may have received, since the outbreak of COVID-19. At Round 2, respondents are asked to report the lowest overall monthly income, after taxes and contributions, that their entire household had, including any financial

support that they may have received, since their last interview (since July 2020). But at Round 2, this question is not asked if the respondent reported having the same overall monthly income since their last interview.

Differences with the Harmonized HRS COVID

In the HRS COVID, respondents are asked to report whether their income has gone up, down, or stayed about the same since the beginning of the COVID-19 pandemic. The HRS COVID also asks additional questions related to the respondent’s income change because of the pandemic. Specifically, if the respondent reports that their income has gone up or down, they are asked to report whether their earnings from work, income from a retirement plan or other assets, income from a business, or another type of income changed. These questions are not asked in the SHARE Corona survey.

Unlike the HRS COVID, the SHARE Corona survey asks the first respondent of the household to report their overall household monthly income, after taxes and contributions, for a typical month before the pandemic and to report their lowest overall household monthly income including any financial support, after taxes and contribution, during the pandemic. Additionally, the HRS COVID does not ask respondents to report their highest overall household monthly income including any financial support, after taxes and contribution, during the pandemic, nor whether their household's monthly income has stayed the same every month since their last interview. The HRS COVID does not provide imputed values as part of its public release.

Comparability with the Gateway Harmonized SHARE

These variables are related to HHwITOTHHINC, which is the value of the total household income, excluding taxes and contributions, in the Gateway Harmonized SHARE.

SHARE Variables Used:

Round 1 Covid-19:

|            |                                                         |

| 0.No          | 53817       | 39774       |
| 1.Yes         | 3730        | 2725        |

| Value-----                | HH1CFWTDRWSV |
|---------------------------|--------------|
| 0.No imputation           | 13294        |
| 1.Imputed                 | 649          |
| 2.Imp:not designated resp | 43604        |

**How Constructed:**

At Round 1, the SHARE Corona survey asks household members who were selected as eligible respondents for this section to report whether their household was able to make ends meet "with great difficulty", "with some difficulty", "fairly easily", or "easily" based on their household's total monthly income since the outbreak of COVID-19. At Round 2, the SHARE Corona survey asks household members who were selected as eligible respondents for this section to report whether their household was able to make ends meet "with great difficulty", "with some difficulty", "fairly easily", or "easily" based on their household's total monthly income since their last interview (since July 2020). At Rounds 1 and 2, if the respondent reported "with great difficulty" or "with some difficulty", they were then asked whether they had to dip into their savings to cover necessary day-to-day expenses during the pandemic.

HHrCWTDRWSV indicates whether the household respondent withdrew from their savings to cover necessary day-to-day expenses during the COVID-19 pandemic. HHrCWTDRWSV is coded as 0 if the household respondent reports that their household did not have difficulty making ends meet based on their household's total monthly income during the pandemic. HHrCWTDRWSV is also coded as 0 if the household respondent reports that their household had difficulty making ends meet based on their household's total monthly income during the pandemic, but reports that they never had to withdraw from their savings to cover necessary day-to-day expenses during the pandemic. HHrCWTDRWSV is coded as 1 if the household respondent reports that they had difficulty making ends meet based on their household's total monthly income during the pandemic and reports that they had to withdraw from their savings to cover necessary day-to-day expenses during the pandemic. In Round 2, special missing value (.n) is assigned if the household respondent reports that their household had no savings. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. HHrCWTDRWSV is coded as plain missing (.) if the respondent did not participate in the current COVID round.

HHrCFWTDRWSV is a flag variable that indicates whether responses to HHrCWTDRWSV are imputed by SHARE. HHrCFWTDRWSV is only available at Round 1, and is assigned 0 if responses are not imputed, 1 if responses are imputed, and 2 if responses are imputed because they are not the designated respondent for the

household. HHrCFWTD RSV is coded as plain missing (.) if the respondent did not participate in the current COVID round.

**Cross Round Differences in SHARE**

At Round 1, household respondents are asked to report whether their household was able to make ends meet "with great difficulty", "with some difficulty", "fairly easily", or "easily" based on their household's total monthly income since the outbreak of COVID-19. At Round 2, household respondents are asked to report whether their household was able to make ends meet "with great difficulty", "with some difficulty", "fairly easily", or "easily" based on their household's total monthly income since their last interview (since July 2020).

At Round 1, household respondents are asked to report whether they ever needed to dip into their savings to cover the necessary day-to-day expenses since the outbreak of COVID-19. At Round 2, household respondents are asked to report whether they ever needed to dip into their savings to cover the necessary day-to-day expenses since their last interview (since July 2020), and can report "I had no savings" as one of their responses.

**Differences with the Harmonized HRS COVID**

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents to report whether they withdrew from their savings since the outbreak of COVID-19 to cover necessary day-to-day expenses. The HRS COVID does not provide imputed values as part of its public release.

**Comparability with the Gateway Harmonized SHARE**

No comparable variables are available in the Gateway Harmonized SHARE.

**SHARE Variables Used:**

### How Constructed:

At Round 1, the SHARE Corona survey asks household members who were selected as eligible respondents for this section to report whether their household was able to make ends meet "with great difficulty", "with some difficulty", "fairly easily", or "easily" based on their household's total monthly income since the outbreak of COVID-19. At Round 2, the SHARE Corona survey asks household members who were selected as eligible respondents for this section to report whether their household was able to make ends meet "with great difficulty", "with some difficulty", "fairly easily", or "easily" based on their household's total monthly income since their last interview (since July 2020). At Rounds 1 and 2, if the respondent reported "with great difficulty" or "with some difficulty", they were then asked whether they needed to postpone regular payments such as rent, mortgage and loan payments, and/or utility bills during the pandemic.

HHrCMISSBILL indicates whether the household respondent postponed regular bills during the COVID-19 pandemic. HHrCMISSBILL is coded as 0 if the household respondent reports that their household did not have difficulty making ends meet based on their household's total monthly income during the pandemic. HHrCMISSBILL is also coded as 0 if the household respondent reports that their household had difficulty making ends meet based on their household's total monthly income during the pandemic, but reports that they did not need to postpone regular payments, such as rent, mortgage and loan payments, and/or utility bills during the pandemic. HHrCMISSBILL is coded as 1 if the household respondent reports that their household had difficulty making ends meet based on their household's total monthly income during the pandemic and reports that they needed to postpone regular payments, such as rent, mortgage and loan payments, and/or utility bills during the pandemic. In Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. HHrCMISSBILL is coded as plain missing (.) if the respondent did not participate in the current COVID round.

HHrCFMISSBILL is a flag variable that indicates whether responses to HHrCMISSBILL are imputed by SHARE. HHrCFMISSBILL is only available at Round 1, and is assigned 0 if responses are not imputed, 1 if responses are imputed, and 2 if responses are imputed because they are not the designated respondent for

the household. HHrCFMISSBILL is coded as plain missing (.) if the respondent did not participate in the current COVID round.

### Cross Round Differences in SHARE

At Round 1, household respondents are asked to report whether their household was able to make ends meet "with great difficulty", "with some difficulty", "fairly easily", or "easily" based on their household's total monthly income since the outbreak of COVID-19. At Round 2, household respondents are asked to report whether their household was able to make ends meet "with great difficulty", "with some difficulty", "fairly easily", or "easily" based on their household's total monthly income since their last interview (since July 2020).

At Round 1, household respondents are asked to report whether they ever needed to postpone regular payments such as rent, mortgage and loan payments, and/or utility bills since the outbreak of COVID-19. At Round 2, household respondents are asked to report whether they ever needed to postpone regular payments such as rent, mortgage and loan payments, and/or utility bills since their last interview (since July 2020).

### Differences with the Harmonized HRS COVID

In the HRS COVID, respondents are asked to report whether they missed any regular payments on rent or mortgage, missed any regular payments on credit cards or other debt, missed any other regular payments such as utilities or insurance, or could not pay medical bills during the coronavirus pandemic. The SHARE Corona survey asks household members who were selected as eligible respondents for this section to report whether they needed to postpone regular payments such as rent, mortgage and loan payments, and/or utility bills since the outbreak of COVID-19. As a result, the Harmonized HRS COVID includes RrCMISSBILL, which is at the respondent-level, while the Gateway Harmonized SHARE COVID includes HHrCMISSBILL, which is at the household-level.

In Round 2 of the HRS COVID, respondents are asked about missing any regular payments since the beginning of the outbreak in March 2020, likely overlapping with any report of missing regular payments in the first round. In Round 2 of the SHARE COVID, household respondents are asked to report whether they needed to postpone regular payments since their last COVID interview or July 2020, intended to be separate from any report of missing regular payments in the first round.

The HRS COVID does not provide imputed values as part of its public release.

### How Constructed:

At Round 1, household respondents are asked to report whether they or any other household member received additional financial support due to the outbreak of COVID-19 from their employer, government, relatives, friends, and/or others. At Round 2, respondents are asked to report whether they received additional financial support due to the Corona crisis from their employer, government, relatives, friends, and/or others since their last interview (since July 2020). At Rounds 1 and 2, if they report yes to this question, they are then asked to specify who gave them this financial support. Please note that Round 1 asks these questions at the household-level while Round 2 asks these questions at the respondent-level.

HHrCFINGOV indicates whether the respondent or any other household member received financial support from the government due to the outbreak of COVID-19. HHrCFINGOV is only available at Round 1. HHrCFINGOV is coded as 0 if the respondent reports that neither they nor any other household member received financial

support or if they did not report that they or any other household member received financial support from the government due to the pandemic. HHrCFINGOV is coded as 1 if the respondent reports that they or any other household member received financial support from the government due to the pandemic. HHrCFINGOV is coded as plain missing (.) if the respondent did not participate in the current COVID round.

HHrCFFINGOV is a flag variable that indicates whether responses to HHrCFINGOV are imputed by SHARE. HHrCFFINGOV is only available at Round 1, and is assigned 0 if responses are not imputed, 1 if responses are imputed, and 2 if responses are imputed because they are not the designated respondent for the household. HHrCFFINGOV is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFINGOV indicates whether the respondent received financial support from the government due to the Corona crisis since their last interview (since July 2020). RrCFINGOV is only available at Round 2. RrCFINGOV is coded as 0 if the respondent reports that they have not received financial support or if they did not report that they received financial support from the government due to the pandemic. RrCFINGOV is coded as 1 if the respondent reports that they received financial support from the government due to the pandemic. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCFINGOV is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCFINGOV indicates whether the respondent's spouse received financial support from the government due to the Corona crisis since their last interview (since July 2020). SrCFINGOV is taken from the spouse's values to RrCFINGOV. In addition to the special missing values used in RrCFINGOV, SrCFINGOV employs two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, household respondents are asked to report whether they or any other household member received additional financial support due to the outbreak of COVID-19 from their employer, government, relatives, friends, and/or others. At Round 2, respondents are asked to report whether they received additional financial support due to the Corona crisis from their employer, government, relatives, friends, and/or others since their last interview (since July 2020). At Rounds 1 and 2, if they report yes to this question, they are then asked to specify who gave them this financial support. Round 1 asks financial support questions about the household whereas Round 2 asks these questions only to the respondent. As a result, Round 1 includes HHrCFINGOV, which is at the household-level, while Round 2 includes RrCFINGOV, which is at the respondent-level.

## Differences with the Harmonized HRS COVID

The HRS COVID asks financial support questions to respondents and their spouse. Round 1 of the SHARE Corona survey asks these questions about the household whereas Round 2 asks these questions only to the respondent. As a result, the Harmonized HRS COVID includes HrCFINGOV which is at the couple-level, while the Gateway Harmonized SHARE COVID includes HHrCFINGOV in Round 1 and RrCFINGOV in Round 2, which are at the household-level and respondent-level, respectively.

The HRS COVID does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### How Constructed:

At Round 1, household respondents are asked to report whether they or any other household member received additional financial support due to the outbreak of COVID-19 from their employer, government, relatives, friends, and/or others. At Round 2, respondents are asked to report whether they received additional financial support due to the Corona crisis from their employer, government, relatives, friends, and/or others since their last interview (since July 2020). At Rounds 1 and 2, if they report yes to this question, they are then asked to specify who gave them this financial support. Please note that Round 1 asks these questions at the household-level while Round 2 asks these questions at the respondent-level.

HHrCFANY indicates whether the respondent or any other household member received financial support from others due to the outbreak of COVID-19. These include their employer, relatives, friends, and others, but not the government. HHrCFANY is only available at Round 1. HHrCFANY is coded as 0 if the respondent

reports that neither they nor any other household member received financial support or if they did not report that they or any other household member received financial support from their employer, relatives, friends, or others due to the pandemic. HHrCFANY is coded as 1 if the respondent reports that they or any other household member received financial support from their employer, relatives, friends, or others due to the pandemic. HHrCFANY is coded as plain missing (.) if the respondent did not participate in the current COVID round.

HHrCFFANY is a flag variable that indicates whether responses to HHrCFANY are imputed by SHARE. HHrCFFANY is only available at Round 1, and is assigned 0 if responses are not imputed, 1 if responses are imputed, and 2 if responses are imputed because they are not the designated respondent for the household. HHrCFFANY is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFANY indicates whether the respondent received financial support from others due to the Corona crisis since their last interview (since July 2020). These include their employer, relatives, friends, and others, but not the government. RrCFANY is only available at Round 2. RrCFANY is coded as 0 if the respondent reports that they have not received financial support or if they did not report that they received financial support from their employer, relatives, friends, or others due to the pandemic. RrCFANY is coded as 1 if the respondent reports that they received financial support from their employer, relatives, friends, or others due to the pandemic. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCFANY is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCFANY indicates whether the respondent's spouse received financial support from others due to the Corona crisis since their last interview (since July 2020). SrCFANY is taken from the spouse's values to RrCFANY. In addition to the special missing values used in RrCFANY, SrCFANY employs two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, household respondents are asked to report whether they or any other household member received additional financial support due to the outbreak of COVID-19 from their employer, government, relatives, friends, and/or others. At Round 2, respondents are asked to report whether they received additional financial support due to the Corona crisis from their employer, government, relatives, friends, and/or others since their last interview (since July 2020). At Rounds 1 and 2, if they report yes to this question, they are then asked to specify who gave them this financial support. Round 1 asks financial support questions about the household whereas Round 2 asks these questions only to the respondent. As a result, Round 1 includes HHrCFANY, which is at the household-level, while Round 2 includes RrCFANY, which is at the respondent-level.

## Differences with the Harmonized HRS COVID

The HRS COVID asks financial support questions to respondents and their spouse. Round 1 of the SHARE Corona survey asks these questions about the household whereas Round 2 asks these questions only to the respondent. As a result, the Harmonized HRS COVID includes HrCFANY which is at the couple-level, while the Gateway Harmonized SHARE COVID includes HHrCFANY in Round 1 and RrCFANY in Round 2, which are at the household-level and respondent-level, respectively.

Unlike the SHARE Corona survey, the HRS COVID also asks whether the respondent and their spouse provided financial support to others due to the COVID-19 pandemic. The HRS COVID does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

HHrCFANY and RrCFANY: These variables are related to HwFCANY, HwFPANY, HwFOANY, and HwFFANY in the Gateway Harmonized SHARE, which are variables that indicate whether the respondent and spouse received any financial gift worth 250 Euro or more, not including shared housing or shared food, from their children and/or grandchildren; from their mother, father, mother-in-law, father-in-law, stepmother, or stepfather; other relatives; and other non-relatives, respectively, in the past year.

**SHARE Variables Used:**

## Round 1 Covid-19:

### How Constructed:

RrCWORKBF indicates whether the respondent was working at the beginning of the COVID-19 pandemic. RrCWORKBF is only available at Round 1. At Round 1, the respondent is asked whether they were employed or self-employed, including working for family business, at the time when the pandemic broke out. RrCWORKBF is coded as 0 if the respondent reports that they were not employed or self-employed when the pandemic started. RrCWORKBF is coded as 1 if the respondent reports that they were employed or self-employed when the pandemic started. RrCWORKBF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFWORKBF is a flag variable that indicates whether responses to RrCWORKBF are imputed by SHARE. RrCFWORKBF is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFWORKBF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

At Round 1, respondents are first asked to report whether they were employed or self-employed, including working for a family business, at the time when the COVID-19 pandemic started. If the respondent reported yes to being employed or self-employed at the beginning of the pandemic, they are then asked two additional questions. For the first additional question, respondents are asked to report whether they became unemployed, were laid off, or had to close their business due to the COVID-19 pandemic. After, respondents are asked to describe their work situation since the outbreak of COVID-19 and may respond with one of the following options: "worked at home only", "worked at the usual work place", "worked from home and at the usual work place", or "none of these" (presumably indicating that they did not work at all). At Round 2, respondents are asked to report their current employment situation and may respond with one of the following options: "retired", "employed or self-employed (including working for family business)", "unemployed", "permanently sick or disabled", "homemaker", or "other".

RrCWORK indicates whether the respondent is currently working. At Round 1, RrCWORK is coded as 0 if the respondent reports that they were not employed or self-employed when the pandemic started; they were employed or self-employed when the pandemic started but they became unemployed, were laid off, or had to close their business due to the pandemic; or if they have not worked at all, neither at home nor at their usual workplace, during the pandemic. At Round 1, RrCWORK is coded as 1 if the respondent reports that they were working when the pandemic started, did not become unemployed, get laid off, or have to close their business due to the pandemic and that they have worked at home and/or at their usual workplace during the pandemic. At Round 2, RrCWORK is coded as 0 if the respondent reports that they are retired, unemployed, permanently sick or disabled, a homemaker, or other. At Round 2, RrCWORK is coded as 1 if the respondent reports that they are employed or self-employed (including working for family business). At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and

(.m), respectively. RrCWORK is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFWORK is a flag variable that indicates whether responses to RrCWORK are imputed by SHARE. RrCFWORK is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFWORK is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCWORKBF indicates whether the respondent's spouse was working at the beginning of the COVID-19 pandemic. SrCFWORKBF is a flag variable that indicates whether responses to SrCWORKBF are imputed by SHARE. SrCWORK indicates whether the respondent's spouse is currently working. SrCFWORK is a flag variable that indicates whether responses to SrCWORK are imputed by SHARE. SrCWORKBF, SrCFWORKBF, SrCWORK, and SrCFWORK are taken from the spouse's values to RrCWORKBF, RrCFWORKBF, RrCWORK, and RrCFWORK, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

### Cross Round Differences in SHARE

Unlike Round 1, Round 2 does not ask respondents to report whether they were working at the beginning of the COVID-19 pandemic. For this reason, RrCWORKBF is not available at Round 2.

At Round 1, if the respondent reported yes to being employed or self-employed at the beginning of the pandemic, they are then asked two additional questions. For the first additional question, respondents are asked to report whether they became unemployed, were laid off, or had to close their business due to the COVID-19 pandemic. After, respondents are asked to describe their work situation since the outbreak of COVID-19 and may respond with one of the following options: "worked at home only", "worked at the usual work place", "worked from home and at the usual work place", or "none of these" (presumably indicating that they did not work at all).

At Round 2, respondents are asked to report their current employment situation and may respond with one of the following options: "retired", "employed or self-employed (including working for family business)", "unemployed", "permanently sick or disabled", "homemaker", or "other".

### Differences with the Harmonized HRS COVID

In Round 1 of the HRS COVID, respondents were asked to report whether their work was affected because of the coronavirus pandemic. The respondent may report: "yes", "no", or "no, was not working when it started". In Round 2 of the HRS COVID, respondents were asked "what kind of work, if any, did you do in early March 2020 before the pandemic started", and can report either "I worked for pay for someone else", "I was self-employed", "I worked for someone else and I also worked for myself", or "I didn't work". In Round 1 of the SHARE Corona survey, respondents are asked to report whether they were employed or self-employed, including working for family business, at the time COVID-19 broke out. This question was not asked in Round 2 of the SHARE Corona survey. Despite the differences in question wording, the variable RrCWORKBF in Round 1 is comparable between the Harmonized HRS COVID and the Gateway Harmonized SHARE COVID datasets.

In Round 1 of the HRS COVID, respondents were asked to report whether they have worked for pay at any time since the beginning of the coronavirus pandemic. In Round 2 of the HRS COVID, respondents were asked to report whether there was a period of two weeks or more when they were not working since March 2020 and, if not, whether they worked for a month or more between March 2020 and March 2021. In Round 1 of the SHARE Corona survey, respondents were first asked whether they were employed or self-employed, including working for family business, at the time COVID-19 broke out. If they answered yes, they were then asked two additional questions. For the first additional question, respondents were asked whether they became unemployed, were laid off, or had to close their business due to the pandemic. After, they were asked to indicate whether they worked at home only, worked at their usual workplace outside their home, worked from home and at their usual workplace, or none of these (indicating that they did not work at all). At Round 2 of the SHARE Corona survey, respondents were asked to indicate whether they are currently retired, employed or self-employed (including working for family business), unemployed, permanently sick or disabled, a homemaker, or other. As a result, RrCWORK in Round 1 of the Harmonized HRS COVID refers to whether the respondent worked for pay at any time since the beginning of the coronavirus outbreak, RrCWORK in Round 2 of the Harmonized HRS COVID refers to whether the respondent worked for a month or

more between March 2020 and March 2021, and RrCWORK in the Gateway Harmonized SHARE COVID refers to whether the respondent is currently working.

The HRS COVID does not provide imputed values as part of its public release.

**Comparability with the Gateway Harmonized SHARE**

RrCWORK: This variable is comparable to RwWORK in the Gateway Harmonized SHARE, which also includes RwSLFEMP, indicating whether the respondent is self-employed, and other related variables.

**SHARE Variables Used:**

|                   |                                                          |

| 5.Retired                   | 21831     |
| 6.Permanently sick or disab | 613       |
| 8.Homemaker                 | 2423      |

### How Constructed:

At Round 2, respondents are asked to report their current employment situation. Respondents may report one of the following options: "retired", "employed or self-employed (including working for family business)", "unemployed", "permanently sick or disabled", "homemaker", or "other".

RrCLBRF\_S indicates the respondent's current labor force status. RrCLBRF\_S is only available at Round 2. RrCLBRF\_S is coded as 1 if the respondent reports that they are employed or self-employed (including working for family business). RrCLBRF\_S is coded as 3 if the respondent reports that they are unemployed. RrCLBRF\_S is coded as 5 if the respondent reports that they are retired. RrCLBRF\_S is coded as 6 if the respondent reports that they are permanently sick or disabled. RrCLBRF\_S is coded as 8 if the respondent reports that they are a homemaker. Special missing value (.o) is assigned if the respondent reports "other" to this question. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCLBRF\_S is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCLBRF\_S indicates the respondent's spouse's current labor force status. SrCLBRF\_S is taken from the spouse's value to RrCLBRF\_S. In addition to the special missing values used in RrCLBRF\_S, SrCLBRF\_S employs two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

Unlike Round 2, Round 1 does not directly ask respondents to report their current labor force status. Round 1 does ask respondents to separately report whether they were employed or self-employed, including working for a family business, at the time COVID-19 broke out and whether they have become unemployed, were laid off, or had to close their business due to COVID-19, but does not ask them to report whether they are currently retired, permanently sick or disabled, or a homemaker. For this reason, RrCLBRF\_S is not available at Round 1.

## Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents to report their current labor force status. For this reason, RrCLBRF is not available in the HRS COVID.

## Comparability with the Gateway Harmonized SHARE

RrCLBRF\_S: This variable is comparable to RwlBRF\_S in the Gateway Harmonized SHARE, which also includes RwlNLBRF, indicating whether the respondent is in the labor force, and other related variables. The "\_S" appended to the end of these variable names is meant to indicate that the SHARE Corona survey and Gateway Harmonized SHARE use a slightly different categorization than RwlBRF in the RAND HRS.

### How Constructed:

At Rounds 1 and 2, respondents are asked a series of questions related to their employment status during the COVID-19 pandemic. At Round 1, respondents are first asked to report whether they were employed or self-employed, including working for a family business, at the time when COVID-19 broke out. If the respondent reported yes to being employed or self-employed at the time the pandemic started, they are then asked to report whether they became unemployed, were laid off, or had to close their business due to the COVID-19 pandemic. Respondents may report either "yes" or "no" to this question. At Round 2, respondents are first asked to report their current employment situation and may report one of the following options: "retired", "employed or self-employed (including working for family business)", "unemployed", "permanently sick or disabled", "homemaker", or "other". Respondents are also asked to report whether they have become unemployed, furloughed, laid off, or had to close their business since their last interview (since July 2020). Respondents may report either "yes", "no", or "does not apply (e.g., retired, permanently sick or disabled, homemaker)" to this question.

RrCJLST indicates whether the respondent lost their job due to the COVID-19 pandemic. At Round 1, RrCJLST is coded as 0 if the respondent reports that they were employed or self-employed at the time COVID-19 broke out and did not become unemployed, get laid off, or have to close their business due to the pandemic. At Round 1, RrCJLST is coded as 1 if the respondent reports that they were employed or self-employed at the time COVID-19 broke out and they became unemployed, were laid off, or had to close their business because of the pandemic. At Round 2, RrCJLST is coded as 0 if the respondent reports that they have not become unemployed, furloughed, laid off, or had to close their business since their last interview. At Round 2, RrCJLST is coded as 1 if the respondent reports that they have become unemployed, furloughed, laid off, or had to close their business since their last interview. At Round 1, special missing value (.w) is assigned if the respondent was not asked this question because they reported that they were not employed or self-employed when the pandemic started. At Round 2, special missing value (.w) is assigned if the respondent reported not being employed or self-employed when the pandemic started at Round 1 and not working at Round 2. At Round 2, special missing value (.n) is assigned if the respondent reported "does not apply (e.g., retired, permanently sick or disabled, homemaker)" to this question and they do not meet the requirements to be assigned special missing value (.w). At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCJLST is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFJLST is a flag variable that indicates whether responses to RrCJLST are imputed by SHARE. RrCFJLST is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFJLST is coded as plain missing (.) if the respondent did not participate in the current COVID round.

For the following variables, at Rounds 1 and 2, respondents are also asked a series of questions related to how their job has changed during the COVID-19 pandemic. At Round 1, if the respondent reported that they worked at home only, worked at their usual workplace, or worked from home and at their usual workplace, they were then asked to report in two separate questions whether their working hours reduced and increased since the pandemic started. At Round 2, if the respondent reports that they are currently employed or self-employed, they are then asked to report in two separate questions about whether they worked shorter and longer hours since their last interview (since July 2020).

RrCJCHTIM indicates whether the respondent's working hours changed during the COVID-19 pandemic. At Round 1, RrCJCHTIM is coded as 0 if the respondent reports that they have worked at home and/or at their usual workplace during the pandemic, but they did not reduce or increase their working hours. At Round 1, RrCJCHTIM is coded as 1 if the respondent reports that they have worked at home and/or their usual workplace during the pandemic and they have either reduced or increased their working hours. At Round 2, RrCJCHTIM is coded as 0 if the respondent reports that they are currently employed or self-employed, but did not work longer or shorter hours since their last interview. At Round 2, RrCJCHTIM is coded as 1 if

the respondent reports that they are currently employed or self-employed and either worked shorter or longer hours since their last interview. At Round 1, special missing value (.w) is assigned if the respondent was not asked this question because they reported that they were not employed or self-employed when the pandemic started. At Round 2, special missing value (.w) is assigned if the respondent reported not being employed or self-employed when the pandemic started at Round 1 and not working at Round 2. At Round 1, special missing value (.k) is assigned if the respondent reports that they have not worked at all, neither at home nor at their usual workplace, during the pandemic. At Round 2, special missing value (.k) is assigned if the respondent was not asked this question because they did not report being currently employed or self-employed and they do not meet the requirements to be assigned special missing value (.w). At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCJCHTIM is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCJCHHRC indicates how the respondent's working hours changed during the COVID-19 pandemic. At Round 1, RrCJCHHRC is coded as 1 if the respondent reports that they have worked at home and/or at their usual workplace during the pandemic and they have increased their working hours. At Round 1, RrCJCHHRC is coded as 2 if the respondent reports that they have worked at home and/or at their usual workplace during the pandemic and they have decreased their working hours. At Round 1, RrCJCHHRC is coded as 3 if the respondent reports that they have worked at home and/or at their usual workplace during the pandemic, and they reduced and increased their working hours. At Round 2, RrCJCHHRC is coded as 1 if the respondent reports that they are currently employed or self-employed and they have worked longer hours since their last interview. At Round 2, RrCJCHHRC is coded as 2 if the respondent reports that they are currently employed or self-employed and they have worked shorter hours since their last interview. At Round 2, RrCJCHHRC is coded as 3 if the respondent reports that they are currently employed or self-employed and they have worked longer and shorter hours since their last interview. At Round 1, special missing value (.w) is assigned if the respondent was not asked this question because they reported that they were not employed or self-employed when the pandemic started. At Round 1, special missing value (.k) is assigned if the respondent reported that they did not work at all during the pandemic. At Round 1, special missing value (.n) is assigned if the respondent reported that they worked at home and/or at their usual workplace during the pandemic, but did not reduce or increase their working hours. At Round 2, special missing value (.w) is assigned if the respondent reported not being employed or self-employed when the pandemic started at Round 1 and not working at Round 2. At Round 2, special missing value (.k) is assigned if the respondent was not asked these questions because they did not report being currently employed or self-employed and they do not meet the requirements to be assigned special missing value (.w). At Round 2, special missing value (.n) is assigned if the respondent reported that they were currently employed or self-employed and they have not worked longer or shorter hours since their last interview. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCJCHHRC is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFJCHTIM is a flag variable that indicates whether responses to RrCJCHTIM are imputed by SHARE. RrCFJCHTIM is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFJCHTIM is coded as plain missing (.) if the respondent did not participate in the current COVID round. Please refer to RrCFJCHTIM to see whether values used in RrCJCHHRC are imputed by SHARE at Round 1.

SrCJLST indicates whether the respondent's spouse lost their job due to the COVID-19 pandemic. SrCFJLST is a flag variable that indicates whether responses to SrCJLST are imputed by SHARE. SrCJCHTIM indicates whether the respondent's spouse's working hours changed during the COVID-19 pandemic. SrCFJCHTIM is a flag variable that indicates whether responses to SrCFJCHTIM are imputed by SHARE. SrCJCHHRC indicates how the respondent's spouse's working hours changed during the COVID-19 pandemic. SrCJLST, SrCFJLST, SrCJCHTIM, SrCFJCHTIM, and SrCJCHHRC are taken from the spouse's values to RrCJLST, RrCFJLST, RrCJCHTIM, RrCFJCHTIM, and RrCJCHHRC, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked questions about how their job has changed since the outbreak of COVID-19, while at Round 2, respondents are asked questions about how their job has changed since their last interview (since July 2020).

It is also important to note the difference in question skip patterns across rounds. At Round 1, the respondent is first asked whether they were employed or self-employed, including working for a family business, at the time when COVID-19 broke out. If the respondent reported yes to being employed or self-employed at the time the pandemic started, they are then asked whether they have worked at home only, worked at their usual workplace, worked from home and at their usual workplace, or none of these since the outbreak of COVID-19. If the respondent answered that they worked at home only, worked at their usual workplace, or worked from home and at their usual workplace, they were then asked to report in two separate questions whether their working hours reduced and increased since the pandemic started. At Round 2, respondents are first asked to report their current employment situation and may report one of the following options: "retired", "employed or self-employed (including working for family business)", "unemployed", "permanently sick or disabled", "homemaker", or "other". If the respondent reports that they are currently employed or self-employed, they are then asked to report in two separate questions whether they worked shorter and longer hours since their last interview (since July 2020).

### **Differences with the Harmonized HRS COVID**

In Round 1 of the HRS COVID, respondents are asked whether their work was affected by the pandemic. The respondent may report either "yes", "no", or "no, was not working when it started". If the respondent reports that their work was affected by the pandemic, they are then asked whether they had to stop work entirely. If the respondent reports that they had to stop work entirely during the pandemic, they are then asked why they had to stop work entirely during the pandemic and may report that they stopped working because they lost their job/were laid off permanently, were furloughed/laid off temporarily, quit, or stopped work entirely for another reason. In Round 2 of the HRS COVID, respondents are asked if there was a period of two weeks or more when they were not working since March 2020. The respondent may report either "yes" or "no". If the respondent reports that there was a period of two weeks or more when they were not working, they are then asked why they stopped working and may report that they stopped working because they lost their job/were laid off permanently, were furloughed/laid off temporarily, were on vacation/taking voluntary time off, were sick with illness, were caring for others who needed them, quit, retired, or stopped work for another reason.

At Round 1 of the SHARE Corona survey, respondents are first asked whether they were employed or self-employed, including working for a family business, at the time when the pandemic started. If the respondent reported yes, they were then asked whether they became unemployed, were laid off, or had to close their business due to the pandemic. At Round 2 of the SHARE Corona survey, respondents are first asked to report their current employment status, to which they may report being retired, employed or self-employed (including working for family business), unemployed, permanently sick or disabled, a homemaker, or other. At Round 2, the respondent was also asked to report whether they have become unemployed, furloughed, laid off, or had to close their business since their last interview. Despite the differences in question wording, the variable RrCJLOST is comparable between the Harmonized HRS COVID and Gateway Harmonized SHARE COVID datasets.

In Round 1 of the HRS COVID, if respondents report that their work was affected because of the pandemic but did not have to stop work entirely, they are then asked to report how their work was affected because of the COVID-19 pandemic. Respondents can select all responses that apply, including: changed work days or hours, work became more risky or dangerous, work became harder, work switched to working from home or working remotely, or other. In Round 2 of the HRS COVID, respondents are asked to report how different aspects of their work changed during the pandemic from March 2020 to March 2021 compared to before the pandemic, including: how much physical effort it takes to do their job, how much stress is caused by their job, their enjoyment of their job, their work schedule interfering with their ability to fulfill personal responsibilities, job worries or problems distracting them when they are not at work, not being able to get work done on time because of their home life, or how much their family or personal life drains them of the energy they need to do their job. The respondent may report that the specific aspect "increased", "stayed about the same", or "decreased". At Round 2, the respondent may also report that the specific aspect is not applicable to them.

At Round 1 of the SHARE Corona survey, respondents are first asked whether they were employed or self-employed, including working for a family business, at the time when the pandemic started. If the respondent reported yes, they were then asked whether their work location has changed since the outbreak of COVID-19. If the respondent answered that they worked at home only, worked at their usual workplace, or worked from home and at their usual workplace since the outbreak of COVID-19, they were then asked in two separate questions about whether their working hours reduced or increased since the pandemic started. At Round 2 of the SHARE Corona survey, respondents are first asked to report their current employment

status, to which they may report being retired, employed or self-employed (including working for family business), unemployed, permanently sick or disabled, a homemaker, or other. If the respondent reported being employed or self-employed, they were then asked to report in two separate questions about whether they worked shorter or longer hours since their last interview. As a result, RrCJCHTIM in the Harmonized HRS COVID refers to whether the respondent changed work days or hours due to the COVID-19 pandemic while RrCJCHTIM in the Gateway Harmonized SHARE COVID refers to whether the respondent's working hours changed during the pandemic (since the pandemic started/since their last interview).

Unlike the variable RrCJCHHRC in the Gateway Harmonized SHARE COVID, the Harmonized HRS COVID does not include a variable indicating how the respondent's working hours changed during the pandemic. The HRS COVID also asks respondents whether their work became more risky or dangerous or became harder due to the pandemic, which are not asked in the SHARE Corona survey. The HRS COVID does not provide imputed values as part of its public release.

### Comparability with the Gateway Harmonized SHARE

RrCJLOST: This variable is related to RwUNEMP, which indicates whether the respondent considered themselves as unemployed, in the Gateway Harmonized SHARE.

### SHARE Variables Used:

#### Round 1 Covid-19:

|              |                                                         |
|--------------|---------------------------------------------------------|
| EMPSELF      | Work: employed or self-employed when COVID-19 broke out |
| EMPSELF_F    | Work: employed or self-employed when COVID-19 broke out |
| IWHOURS      | Work: increased working hours since outbreak            |
| IWHOURS_F    | Work: increased working hours since outbreak - flag     |
| PWORK        | Work: place of work since outbreak                      |
| PWORK_F      | Work: place of work since outbreak - flag               |
| RWHOURS      | Work: reduced working hours since outbreak              |
| RWHOURS_F    | Work: reduced working hours since outbreak - flag       |
| UNEMPLOYED   | Work: unemployed, laid off or business closed due to CO |
| UNEMPLOYED_F | Work: unemployed, laid off or business closed due to CO |

#### Round 2 Covid-19:

|          |                                                         |
|----------|---------------------------------------------------------|
| CAEP005_ | Work: current employment situation                      |
| CAW102_  | Work: unemployed, laid off or business closed since las |

### How Constructed:

At Rounds 1 and 2, respondents are asked to report their work situation during the COVID-19 pandemic. At Round 1, the respondent is first asked to report whether they were employed or self-employed, including working for a family business, at the time when COVID-19 broke out. If the respondent reported yes to being employed or self-employed at the beginning of the pandemic, they are then asked to report whether they have worked at home only, worked at their usual work place, worked from home and at their usual workplace, or none of these since the outbreak of COVID-19. At Round 2, the respondent is first asked to report their current employment status. Respondents can report that they are currently retired, employed or self-employed (including working for family business), unemployed, permanently sick or disabled, a homemaker, or other. If the respondent reported that they are currently employed or self-employed, they are then asked to report whether they worked from home, worked from their usual work place outside their home, or worked elsewhere at a different work place since their last interview.

RrCJIHOME indicates whether the respondent has worked from home or remotely during the COVID-19 pandemic. At Round 1, RrCJIHOME is coded as 0 if the respondent reports that they were employed or self-employed when COVID-19 broke out and only worked at their usual workplace since the COVID-19 outbreak. At Round 1, RrCJIHOME is coded as 1 if the respondent reports that they were employed or self-employed when COVID-19 broke out and worked at home only or worked from home and at their usual workplace since the COVID-19 outbreak. At Round 2, RrCJIHOME is coded as 0 if the respondent reports that they are employed or self-employed, but did not work from home since their last interview. At Round 2, RrCJIHOME is coded as 0 if the respondent reports that they are employed or self-employed and worked from home since their last interview. At Round 1, special missing value (.w) is assigned if the respondent was not asked this question because they reported that they were not employed or self-employed when the pandemic started. At Round 1, special missing value (.k) is assigned if the respondent reported that "none of these" situations applied, indicating that they presumably did not work at all during the pandemic. At Round 2, special missing value (.w) is assigned if the respondent reported not being employed or self-employed when the pandemic started at Round 1 and not working at Round 2. At Round 2, special missing value (.k) is assigned if the respondent was not asked this question because they did not report being currently employed or self-employed and they do not meet the requirements to be assigned special missing value (.w). Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCJIHOME is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCJOHOME indicates whether the respondent has worked outside their home during the COVID-19 pandemic. At Round 1, RrCJOHOME is coded as 0 if the respondent reports that they were employed or self-employed when COVID-19 broke out and only worked at home since the COVID-19 outbreak. At Round 1, RrCJOHOME is coded as 1 if the respondent reports that they were employed or self-employed when COVID-19 broke out and worked at their usual workplace only or worked from home and at their usual workplace since the COVID-19

outbreak. At Round 2, RrCJOHOME is coded as 0 if the respondent reports that they are currently employed or self-employed, but did not work at their usual work place outside their home or at a different work place since their last interview. At Round 2, RrCJOHOME is coded as 1 if the respondent reports that they are currently employed or self-employed and worked at their usual work place outside their home or at a different work place since their last interview. At Round 1, special missing value (.w) is assigned if the respondent was not asked this question because they reported that they were not employed or self-employed when the pandemic started. At Round 1, special missing value (.k) is assigned if the respondent reported that "none of these" situations applied, indicating that they did not work at all during the pandemic. At Round 2, special missing value (.w) is assigned if the respondent reported not being employed or self-employed when the pandemic started at Round 1 and not working at Round 2. At Round 2, special missing value (.k) is assigned if the respondent was not asked this question because they did not report being currently employed or self-employed and they do not meet the requirements to be assigned special missing value (.w). Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCJOHOME is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFJIHOME is a flag variable that indicates whether responses to RrCJIHOME are imputed by SHARE. RrCFJIHOME is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFJIHOME is coded as plain missing (.) if the respondent did not participate in the current COVID round. Please refer to RrCFJIHOME to see whether responses to RrCJOHOME are imputed by SHARE at Round 1.

SrCJIHOME indicates whether the respondent's spouse has worked from home or remotely during the COVID-19 pandemic. SrCFJIHOME is a flag variable that indicates whether responses to SrCJIHOME are imputed by SHARE. SrCJOHOME indicates whether the respondent's spouse has worked outside their home during the COVID-19 pandemic. Please refer to SrCFJIHOME to see whether responses to SrCJOHOME are imputed by SHARE at Round 1. SrCJIHOME, SrCFJIHOME, and SrCJOHOME are taken from the spouse's values to RrCJIHOME, RrCFJIHOME, and RrCJOHOME, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked to report how their work situation has changed since the outbreak of COVID-19, while at Round 2, respondents are asked to report how their work situation has changed since their last interview (since July 2020).

At Round 1, respondents may report that they worked at home only, worked at the usual work place, worked from home and at the usual work place, or none of these (presumably did not work at all), while at Round 2, respondents may report that they worked from home, worked at the usual work place outside their home, or worked at a different work place. Despite these differences in reported options, we believe these questions to be comparable across rounds.

## Differences with the Harmonized HRS COVID

In Round 1 of the HRS COVID, respondents are asked to report whether they worked for pay at any time since the beginning of the COVID-19 pandemic. If the respondent reports that they have worked for pay during the pandemic, then they are asked to report whether they worked outside their home. In Round 2 of the HRS COVID, respondents are asked to report whether they worked from home or from a regular workplace most of the time between March 2020 and March 2021.

In Round 1 of the SHARE Corona survey, respondents are first asked whether they were employed or self-employed, including working for a family business, at the time COVID-19 broke out. If the respondent reported yes, they were then asked to describe their work situation since the outbreak of COVID-19. The respondent may report that they "worked at home only", "worked at the usual workplace", "worked from home and at the usual workplace", or "none of these". A response of "none of these" indicates that they presumably did not work at all. At Round 2 of the SHARE Corona survey, respondents are first asked to report their current employment status, to which they may report being retired, employed or self-employed (including working for family business), unemployed, permanently sick or disabled, a homemaker, or other. If the respondent reported being employed or self-employed, they were then asked to describe their work

situation since their last interview. Despite the differences in question wording, the variables, RrCJIHOME and RrCJOHOME, are comparable between the Harmonized HRS COVID and Gateway Harmonized SHARE COVID.

Unlike the HRS COVID, the SHARE Corona survey does not ask respondents to report whether they would like to work from home after the pandemic is over.

The HRS COVID does not provide imputed values as part of its public release.

**Comparability with the Gateway Harmonized SHARE**

No comparable variables are available in the Gateway Harmonized SHARE.

**SHARE Variables Used:**

### How Constructed:

At Round 2, respondents are asked a series of questions related to their retirement status during the COVID-19 pandemic. The respondent is first asked to report their current employment status. Respondents can report that they are currently retired, employed or self-employed (including working for family business), unemployed, permanently sick or disabled, a homemaker, or other. If the respondent reports that they are currently retired, they are then asked to report whether they retired after the outbreak of COVID-19. If the respondent reports that they are currently retired and retired after the outbreak of COVID-19, they are then asked to report whether they retired as planned, earlier, or later than planned.

RrCRETEMP indicates whether the respondent is currently retired. RrCRETEMP is only available at Round 2. RrCRETEMP is coded as 0 if the respondent reports that they are currently employed or self-employed (including working for family business), unemployed, permanently sick or disabled, a homemaker, or other. RrCRETEMP is coded as 1 if the respondent reports that they are currently retired. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRETEMP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRETEMPS indicates whether the respondent has retired since the outbreak of COVID-19. RrCRETEMPS is only available at Round 2. RrCRETEMPS is coded as 0 if the respondent reports that they are currently retired, but did not retire after the outbreak of COVID-19. RrCRETEMPS is coded as 1 if the respondent reports that they are currently retired and retired after the outbreak of COVID-19. Special missing value (.n) is assigned if the respondent was not asked this question because they did not report being currently retired. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRETEMPS is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRETPLCH indicates how the respondent's retirement plans changed during the COVID-19 pandemic. This question is only asked if the respondent reported that they are currently retired and had retired after the outbreak of COVID-19. RrCRETPLCH is only available at Round 2. RrCRETPLCH is coded as 1 if the respondent reports that they retired earlier than planned. RrCRETPLCH is coded as 2 if the respondent reports that they retired as planned. RrCRETPLCH is coded as 3 if the respondent reports that they retired later than planned. Special missing value (.n) is assigned if the respondent was not asked this question because they did not report being currently retired. Special missing value (.w) is assigned if the respondent was not asked this question because they reported being currently retired, but did not report that they retired after the outbreak of COVID-19. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRETPLCH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCRETEMP indicates whether the respondent's spouse is currently retired. SrCRETEMPS indicates whether the respondent's spouse has retired since the outbreak of COVID-19. SrCRETPLCH indicates how the respondent's spouse's retirement plans changed during the COVID-19 pandemic. SrCRETEMP, SrCRETEMPS, and SrCRETPLCH are taken from the spouse's values to RrCRETEMP, RrCRETEMPS, and RrCRETPLCH, respectively. In

addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

**Cross Round Differences in SHARE**

Unlike Round 2, Round 1 does not ask respondents questions related to their retirement status. For this reason, RrCRETEMP, RrCRETEMPS, and RrCRETPLCH are not available at Round 1.

**Differences with the Harmonized HRS COVID**

In Round 2 of the HRS COVID, respondents are asked to report whether there was a period of two weeks or more when they were not working since March 2020. If the respondent reports that they did not work for a period of two weeks or more, then they are asked to report why they stopped working. The respondent may report that they stopped working because they lost their job/were laid off permanently, were furloughed/laid off temporarily, were on vacation/taking voluntary time off, were sick with illness, were caring for others who needed them, quit, retired, or stopped work for another reason. Although the HRS COVID allows respondents to report whether they are retired, it does not ask respondents additional questions related to their retirement status. For this reason, RrCRETEMP and RrCRETPLCH are not available in the HRS COVID.

**Comparability with the Gateway Harmonized SHARE**

RrCRETEMP: This variable is related to RwRETEMP, which indicates whether the respondent reported being retired as their current job status, in the Gateway Harmonized SHARE.

**SHARE Variables Used:**

|                   |                                          |
|-------------------|------------------------------------------|

### How Constructed:

At Round 1, respondents are asked to report whether they regularly received home care before the COVID-19 outbreak. Respondents can report either "yes" or "no" to having regularly received home care before the COVID-19 outbreak. This question is not asked at Round 2.

RrCRCAREBF indicates whether the respondent regularly received care at home before the COVID-19 outbreak. RrCRCAREBF is coded as 0 if the respondent reports that they did not regularly receive home care before the pandemic. RrCRCAREBF is coded as 1 if the respondent reports that they regularly received home care before the pandemic. RrCRCAREBF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFRCAREBF is a flag variable that indicates whether responses to RrCRCAREBF are imputed by SHARE. RrCFRCAREBF is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFRCAREBF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCRCAREBF indicates whether the respondent's spouse regularly received home care before the COVID-19 outbreak. SrCFRCAREBF is a flag variable that indicates whether responses to SrCRCAREBF are imputed by SHARE. SrCRCAREBF and SrCFRCAREBF are taken from the spouse's values to RrCRCAREBF and RrCFRCAREBF, respectively. In addition to the special missing values used in RrCRCAREBF and RrCFRCAREBF, SrCRCAREBF and SrCFRCAREBF employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

### **Cross Round Differences in SHARE**

This question was only asked at Round 1, so RrCRCAREBF and RrCFRCAREBF are not available at Round 2.

### **Differences with the Harmonized HRS COVID**

The HRS COVID does not ask respondents whether they regularly received home care before the outbreak of the pandemic, however comparable information can be taken from the respondent's previous wave.

### **Comparability with the Gateway Harmonized SHARE**

RrCRCAREBF: This variable is related to RwrFAANY, which indicates whether the respondent received any formal care in their home in the last year; RwrCANY, which indicates whether the respondent received any formal or informal care in the last year (starting in Wave 6); and RwrHOMCAR1Y, which indicates whether the respondent reports any home health care in the last 12 months, in the Gateway Harmonized SHARE.

### **SHARE Variables Used:**

### How Constructed:

At Round 1, respondents are first asked to report whether they have helped others living outside their household with chores, such as obtaining necessities like food, medications, or emergency household

repairs since the Corona outbreak. If the respondent reports that they have helped others living outside their household with chores, they are then asked to report who they helped and whether that help was "less often", "about the same", "more often", or "not applicable" compared to before the Corona outbreak. Relationships include their non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues. At Round 2, respondents are first asked to report separately whether they have helped their non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues with chores, such as obtaining necessities like food, medications, or emergency household repairs since the Corona outbreak. If the respondent reports separately that they have helped their non-co-residing children, parents, other relatives, or other non-relatives with chores, they are then asked to separately report how often they helped each type of relationship with chores in the last three months compared to the first wave of the pandemic. They may report that they helped with chores in the last three months "less often", "about the same", or "more often" compared to the first wave of the pandemic.

RrCGCHORE indicates whether the respondent provided help with chores, such as obtaining necessities like food, medications, or emergency household repairs, to anyone living outside their household during the COVID-19 pandemic. At Round 1, RrCGCHORE is coded as 0 if the respondent reports that they did not provide help with chores to anyone living outside their household since the COVID-19 outbreak. RrCGCHORE is coded as 1 if the respondent reports that they provided help with chores to anyone living outside their household since the COVID-19 outbreak. At Round 2, RrCGCHORE is coded as 0 if the respondent reports specifically that they did not provide help with chores to their non-co-residing children, parents, other relatives, or other non-relatives since the COVID-19 outbreak. RrCGCHORE is coded as 1 if the respondent reports that they provided help with chores to their non-co-residing children, parents, other relatives, or other non-relatives since the COVID-19 outbreak. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGCHORE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFGCHORE is a flag variable that indicates whether responses to RrCGCHORE are imputed by SHARE. RrCFGCHORE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFGCHORE is coded as plain missing (.) if the respondent did not participate in the current round.

RrCGCCHORE indicates whether the respondent provided help with chores, such as obtaining necessities like food, medications, or emergency household repairs, to their non-co-residing children during the COVID-19 pandemic. At Round 1, RrCGCCHORE is coded as 0 if the respondent reports that they did not provide help with chores to anyone living outside their household since the COVID-19 outbreak or that providing help with chores to their children was not applicable to their situation. RrCGCCHORE is coded as 1 if the respondent reports that they provided help with chores to their non-co-residing children less often, about the same, or more often compared to before the pandemic. At Round 2, RrCGCCHORE is coded as 0 if the respondent reports specifically that they did not provide help with chores to their non-co-residing children since the COVID-19 outbreak or that providing help with chores to their non-co-residing children was not applicable to their situation. RrCGCCHORE is coded as 1 if the respondent reports that they provided help with chores to their children since the COVID-19 outbreak. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGCCHORE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFGCCHORE is a flag variable that indicates whether responses to RrCGCCHORE are imputed by SHARE. RrCFGCCHORE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFGCCHORE is coded as plain missing (.) if the respondent did not participate in the current round.

RrCGPCHORE indicates whether the respondent provided help with chores, such as obtaining necessities like food, medications, or emergency household repairs, to their non-co-residing parents during the COVID-19 pandemic. At Round 1, RrCGPCHORE is coded as 0 if the respondent reports that they did not provide help with chores to anyone living outside their household since the COVID-19 outbreak or that providing help with chores to their parents was not applicable to their situation. RrCGPCHORE is coded as 1 if the respondent reports that they provided help with chores to their non-co-residing parents less often, about the same, or more often compared to before the COVID-19 outbreak. At Round 2, RrCGPCHORE is coded as 0 if the respondent reports specifically that they did not provide help with chores to their non-co-residing parents since the COVID-19 outbreak or that providing help with chores to their non-co-residing parents was not applicable to their situation. RrCGPCHORE is coded as 1 if the respondent reports that they provided help with chores to their non-co-residing parents since their previous interview. At Round 2,

don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGPCHORE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFGPCHORE is a flag variable that indicates whether responses to RrCGPCHORE are imputed by SHARE. RrCFGPCHORE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFGPCHORE is coded as plain missing (.) if the respondent did not participate in the current round.

RrCGOCHORE indicates whether the respondent provided help with chores, such as obtaining necessities like food, medications, or emergency household repairs, to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives during the COVID-19 pandemic. At Round 1, RrCGOCHORE is coded as 0 if the respondent reports that they did not provide help with chores to anyone living outside their household since the COVID-19 outbreak or that providing help with chores to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives was not applicable to their situation. RrCGOCHORE is coded as 1 if the respondent reports that they provided help with chores to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives less often, about the same, or more often compared to before the COVID-19 outbreak. At Round 2, RrCGOCHORE is coded as 0 if the respondent specifically reports that they did not provide help with chores to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives since the COVID-19 outbreak, or that providing help with chores to their non-co-residing relatives (not including children or parents) or non-co-residing non-relatives was not applicable to their situation. RrCGOCHORE is coded as 1 if the respondent reports that they provided help with chores to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives since the COVID-19 outbreak. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGOCHORE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFGGOCHORE is a flag variable that indicates whether responses to RrCGOCHORE are imputed by SHARE. RrCFGGOCHORE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFGGOCHORE is coded as plain missing (.) if the respondent did not participate in the current round.

RrCGCCHOREF indicates the frequency the respondent provided help with chores, such as obtaining necessities like food, medication, or emergency household repairs, to their non-co-residing children compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the help provided in the last three months compared to the first wave of the pandemic. In both rounds, RrCGCCHOREF is coded as 0 if the respondent reports that they did not provide help with chores to their non-co-residing children during the COVID-19 pandemic. RrCGCCHOREF is coded as 1 if the respondent reports that they provided help with chores to their non-co-residing children less often compared to the specified timeframes. RrCGCCHOREF is coded as 2 if the respondent reports that they provided help with chores to their non-co-residing children about the same amount as the specified timeframes. RrCGCCHOREF is coded as 3 if the respondent reports that they provided help with chores to their non-co-residing children more often compared to the specified timeframes. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGCCHOREF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCGPCHOREF indicates the frequency the respondent provided help with chores, such as obtaining necessities like food, medication, or emergency household repairs, to their non-co-residing parents compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the help provided in the last three months compared to the first wave of the pandemic. In both rounds, RrCGPCHOREF is coded as 0 if the respondent reports that they did not provide help with chores to their non-co-residing parents during the COVID-19 pandemic. RrCGPCHOREF is coded as 1 if the respondent reports that they provided help with chores to their parents less often compared to the specified timeframes. RrCGPCHOREF is coded as 2 if the respondent reports that they provided help with chores to their parents about the same amount as the specified timeframes. RrCGPCHOREF is coded as 3 if the respondent reports that they provided help with chores to their parents more often compared to the specified timeframes. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGPCHOREF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrcGOCHOREF indicates the frequency the respondent provided help with chores, such as obtaining necessities like food, medication, or emergency household repairs, to their non-co-residing parents, non-co-residing relatives (not including children or parents), or non-co-residing non-relatives compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the help provided in the last three months compared to the first wave of the pandemic. In both rounds, RrcGOCHOREF is coded as 0 if the respondent reports that they did not provide help with chores to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives during the COVID-19 pandemic. RrcGOCHOREF is coded as 1 if the respondent reports that they provided help with chores to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives less often compared to the specified timeframes. RrcGOCHOREF is coded as 2 if the respondent reports that they provided help with chores to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives about the same amount as the specified timeframes. RrcGOCHOREF is coded as 3 if the respondent reports that they provided help with chores to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives more often compared to the specified timeframes. RrcGOCHOREF is coded to prioritize responses of more frequent help to no help. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrcGOCHOREF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrcGCHOREF indicates the frequency the respondent provided help with chores, such as obtaining necessities like food, medication, or emergency household repairs, to anyone living outside their household compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the help provided in the last three months compared to the first wave of the pandemic. Anyone outside their household includes non-co-residing children, non-co-residing parents, other non-co-residing relatives (not including children or parents), and non-co-residing non-relatives. RrcGCHOREF summarizes the information provided in RrcGCCHOREF, RrcGPCHOREF, and RrcGOCHOREF. In both rounds, RrcGCHOREF is coded as 0 if the respondent reports that they did not provide help with chores to anyone living outside their household during the COVID-19 pandemic. RrcGCHOREF is coded as 1 if the respondent reports that they provided help with chores to anyone living outside of their household less often compared to the specified timeframes. RrcGCHOREF is coded as 2 if the respondent reports that they provided help with chores to anyone living outside of their household about the same amount as the specified timeframes. RrcGCHOREF is coded as 3 if the respondent reports that they provided help with chores to anyone living outside of their household more often compared to the specified timeframes. RrcGCHOREF is coded to prioritize responses of more frequent help to no help. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrcGCHOREF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrcFGCHOREF is a flag variable that indicates whether responses to RrcGCHOREF are imputed by SHARE. RrcFGCHOREF summarizes the information provided by RrcFGCCHORE, RrcFGPCHORE, and RrcFGGOCHORE. RrcFGCHOREF is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrcFGCHOREF is coded as plain missing (.) if the respondent did not participate in the current round. Please refer to RrcFGCCHORE, RrcFGPCHORE, and RrcFGGOCHORE to see whether responses to RrcGCCHOREF, RrcGPCHOREF, and RrcGOCHOREF, respectively, are imputed by SHARE.

SrCGCHORE indicates whether the respondent's spouse provided help with chores, such as obtaining necessities like food, medications, or emergency household repairs, to anyone living outside their household during the COVID-19 pandemic. SrCFGCHORE is a flag variable that indicates whether responses to SrCGCHORE are imputed by SHARE. SrCGCCHORE indicates whether the respondent's spouse provided help with chores, such as obtaining necessities like food, medications, or emergency household repairs, to their non-co-residing children during the COVID-19 pandemic. SrCFGCCHORE is a flag variable that indicates whether responses to SrCGCCHORE are imputed by SHARE. SrCGPCHORE indicates whether the respondent's spouse provided help with chores, such as obtaining necessities like food, medications, or emergency household repairs, to their non-co-residing parents during the COVID-19 pandemic. SrCFGPCHORE is a flag variable that indicates whether responses to SrCGPCHORE are imputed by SHARE. SrCGGOCHORE indicates whether the respondent's spouse provided help with chores, such as obtaining necessities like food, medications, or emergency household repairs, to their non-co-residing relatives (not including their children or parents) or non-co-residing non-relatives during the COVID-19 pandemic. SrCFGGOCHORE is a flag variable that indicates whether responses to SrCGGOCHORE are imputed by SHARE. SrCGCCHOREF indicates how often the respondent's spouse provided help with chores, such as obtaining necessities like food, medication, or emergency household repairs, to their non-co-residing children compared to previously. SrCGPCHOREF indicates how often the respondent's spouse provided help with chores, such as obtaining

necessities like food, medication, or emergency household repairs, to their non-co-residing parents compared to previously. SrCGOCHOREF indicates how often the respondent's spouse provided help with chores, such as obtaining necessities like food, medication, or emergency household repairs, to their non-co-residing relatives (not including their children or parents) or non-co-residing non-relatives compared to previously. SrCGCHOREF indicates how often the respondent's spouse provided help with chores, such as obtaining necessities like food, medication, or emergency household repairs, to anyone living outside their household compared to previously. SrCFGCHOREF is a flag variable that indicates whether responses to SrCGCHOREF are imputed by SHARE. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are first asked to report whether they have helped others living outside their household with chores, such as obtaining necessities like food, medications, or emergency household repairs since the outbreak of Corona. If the respondent reports that they have helped others outside their home with chores, they are then asked to report who they helped and whether that help was "less often", "about the same", "more often", or "not applicable" compared to before the Corona outbreak. Relationships include their non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues.

At Round 2, respondents are first asked to report separately whether they have helped their non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues with chores, such as obtaining necessities like food, medications, or emergency household repairs since the Corona outbreak. If the respondent reports that they have helped their own non-co-residing children, non-co-residing parents, other non-co-residing relatives, or other non-co-residing non-relatives with chores, they are then asked to separately report how often they helped each type of relationship with chores in the last three months compared to the first wave of the pandemic. They may report that they helped with chores in the last three months "less often", "about the same", or "more often" compared to the first wave of the pandemic.

## Differences with the Harmonized HRS COVID

The HRS COVID asks questions about providing help with chores during the pandemic to respondents and their spouses whereas the SHARE Corona survey asks these questions to the respondent. Due to the difference in unit of observation, HrCGCHORE, HrCGCCHORE, and HrCGOCHORE are used in the Harmonized HRS COVID to indicate couple-level, and RrCGCHORE, RrCGCCHORE, RrCGPCHORE, and RrCGOCHORE are used in the Gateway Harmonized SHARE COVID to indicate respondent-level.

Relationships in the HRS COVID and the SHARE Corona survey are also categorized differently. The HRS COVID asks whether the respondent and spouse provided any help with chores to non-co-residing children (including grandchildren) in both rounds or children-in-law (including grandchildren-in-law) in Round 1 only, but the SHARE Corona survey only asks about non-co-residing children. The SHARE Corona survey also asks respondents to report whether they have provided any help with chores to non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues separately, but the HRS COVID collapses non-co-residing parents and other non-co-residing relatives into one category and asks about friends, neighbors/other non-relatives, or other individuals separately. Thus, the Gateway Harmonized SHARE COVID includes RrCGPCHORE, which refers to non-co-residing parents, and RrCGOCHORE, which refers to non-co-residing parents, other non-co-residing relatives (not including children or parents) and non-co-residing non-relatives (neighbors, friends, or colleagues), while the Harmonized HRS COVID includes HrCGOCHORE, which includes non-co-residing parents, relatives, and non-relatives.

Chores in Round 1 of the HRS COVID include shopping for groceries, errands, rides, or chores and chores in Round 2 of the HRS COVID include helping with money or paying bills; shopping for groceries, errands, rides, or chores; or with advice, encouragement, moral or emotional support. Chores in the SHARE Corona survey refer to obtaining necessities such as food, medications, or emergency household repairs.

Unlike the SHARE Corona survey, the HRS COVID does not ask about the frequency that the respondent and their spouses provided help with chores to non-co-residing children/children-in-law, parents, relatives, and non-relatives. The HRS COVID also does not provide imputed values as part of its public release.

### Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### SHARE Variables Used:

#### Round 1 Covid-19:

|           |                                                         |

## How Constructed:

At Round 1, respondents are first asked to report whether they have been helped by others living outside their household with chores, such as obtaining necessities like food, medications, or emergency household repairs, since the Corona outbreak. If the respondent reports that they have been helped by others living outside their household with chores, they are then asked to report who they were helped by and whether

that help was "less often", "about the same", "more often", or "not applicable" compared to before the Corona outbreak. Relationships include non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues. At Round 2, respondents are first asked to separately report whether they have been helped by their non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues with chores, such as obtaining necessities like food, medications, or emergency household repairs, since the Corona outbreak. If the respondent reports that they have been helped by their non-co-residing children, non-co-residing parents, other non-co-residing relatives, or other non-co-residing non-relatives with chores, they are then asked to separately report whether that help in the last three months was "less often", "about the same", or "more often" compared to the first wave of the pandemic.

RrCRCHORE indicates whether the respondent received help with chores, such as obtaining necessities like food, medications, or emergency household repairs, from anyone living outside their household during the COVID-19 pandemic. At Round 1, RrCRCHORE is coded as 0 if the respondent reports that they did not receive help with chores from anyone living outside their household since the COVID-19 outbreak. RrCRCHORE is coded as 1 if the respondent reports that they received help with chores from anyone living outside their household since the COVID-19 outbreak. At Round 2, RrCRCHORE is coded as 0 if the respondent separately reports that they did not receive help with chores from their non-co-residing children, non-co-residing parents, other non-co-residing relatives, or other non-co-residing non-relatives since the COVID-19 outbreak. RrCRCHORE is coded as 1 if the respondent separately reports that they received help with chores from their non-co-residing children, non-co-residing parents, other non-co-residing relatives, or other non-co-residing non-relatives since the COVID-19 outbreak. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCHORE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFRCHORE is a flag variable that indicates whether responses to RrCRCHORE are imputed by SHARE. RrCFRCHORE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFRCHORE is coded as plain missing (.) if the respondent did not participate in the current round.

RrCRCCHORE indicates whether the respondent received help with chores, such as obtaining necessities like food, medications, or emergency household repairs, from their non-co-residing children during the COVID-19 pandemic. At Round 1, RrCRCCHORE is coded as 0 if the respondent reports that they did not receive help with chores from anyone living outside their household since the COVID-19 outbreak or that receiving help with chores from their non-co-residing children was not applicable to their situation. RrCRCCHORE is coded as 1 if the respondent reports that they received help with chores from their non-co-residing children less often, about the same, or more often compared to before the pandemic. At Round 2, RrCRCCHORE is coded as 0 if the respondent reports that they did not receive help with chores from their non-co-residing children since the COVID-19 outbreak or that receiving help with chores from their non-co-residing children was not applicable to their situation. RrCRCCHORE is coded as 1 if the respondent reports that they received help with chores from their non-co-residing children since the COVID-19 outbreak. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCCHORE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFRCCHORE is a flag variable that indicates whether responses to RrCRCCHORE are imputed by SHARE. RrCFRCCHORE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFRCCHORE is coded as plain missing (.) if the respondent did not participate in the current round.

RrCRPCHORE indicates whether the respondent received help with chores, such as obtaining necessities like food, medications, or emergency household repairs, from their non-co-residing parents during the COVID-19 pandemic. At Round 1, RrCRPCHORE is coded as 0 if the respondent reports that they did not receive help with chores from anyone living outside their household since the COVID-19 outbreak or that receiving help with chores from their non-co-residing parents was not applicable to their situation. RrCRPCHORE is coded as 1 if the respondent reports that they received help with chores from their non-co-residing parents less often, about the same, or more often compared to before the COVID-19 outbreak. At Round 2, RrCRPCHORE is coded as 0 if the respondent reports that they did not receive help with chores from their non-co-residing parents since the COVID-19 outbreak or that receiving help with chores from their non-co-residing parents was not applicable to their situation. RrCRPCHORE is coded as 1 if the respondent reports that they received help with chores from their non-co-residing parents since the COVID-19

outbreak. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRPCHORE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFRPCHORE is a flag variable that indicates whether responses to RrCRPCHORE are imputed by SHARE. RrCFRPCHORE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFRPCHORE is coded as plain missing (.) if the respondent did not participate in the current round.

RrCROCHORE indicates whether the respondent received help with chores, such as obtaining necessities like food, medications, or emergency household repairs, from their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives during the COVID-19 pandemic. At Round 1, RrCROCHORE is coded as 0 if the respondent reports that they did not receive help with chores from anyone living outside their household since the COVID-19 outbreak or that receiving help with chores from their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives was not applicable to their situation. RrCROCHORE is coded as 1 if the respondent reports that they received help with chores from their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives less often, about the same, or more often compared to before the COVID-19 outbreak. At Round 2, RrCROCHORE is coded as 0 if the respondent reports that they did not receive help with chores from their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives since the COVID-19 outbreak or that receiving help with chores from their non-co-residing relatives or non-co-residing non-relatives was not applicable to their situation. RrCROCHORE is coded as 1 if the respondent reports that they received help with chores from their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives since the COVID-19 outbreak. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCROCHORE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFROCHORE is a flag variable that indicates whether responses to RrCROCHORE are imputed by SHARE. RrCFROCHORE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFROCHORE is coded as plain missing (.) if the respondent did not participate in the current round.

RrCRCCHOREF indicates the frequency the respondent received help with chores, such as obtaining necessities like food, medication, or emergency household repairs, from their non-co-residing children compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the help received in the last three months compared to the first wave of the pandemic. In both rounds, RrCRCCHOREF is coded as 0 if the respondent reports that they did not receive help with chores from their non-co-residing children during the COVID-19 pandemic. RrCRCCHOREF is coded as 1 if the respondent reports that they received help with chores from their non-co-residing children less often compared to the specified timeframes. RrCRCCHOREF is coded as 2 if the respondent reports that they received help with chores from their non-co-residing children about the same amount as the specified timeframes. RrCRCCHOREF is coded as 3 if the respondent reports that they received help with chores from their non-co-residing children more often compared to the specified timeframes. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCCHOREF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRPCHOREF indicates the frequency the respondent received help with chores, such as obtaining necessities like food, medication, or emergency household repairs, from their non-co-residing parents compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the help received in the last three months compared to the first wave of the pandemic. In both rounds, RrCRPCHOREF is coded as 0 if the respondent reports that they did not receive help with chores from their non-co-residing parents during the COVID-19 pandemic. RrCRPCHOREF is coded as 1 if the respondent reports that they received help with chores from their non-co-residing parents less often compared to the specified timeframes. RrCRPCHOREF is coded as 2 if the respondent reports that they received help with chores from their non-co-residing parents about the same amount as the specified timeframes. RrCRPCHOREF is coded as 3 if the respondent reports that they received help with chores from their non-co-residing parents more often compared to the specified timeframes. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRPCHOREF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCROCHOREF indicates the frequency the respondent received help with chores, such as obtaining necessities like food, medication, or emergency household repairs, from their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the help received in the last three months compared to the first wave of the pandemic. In both rounds, RrCROCHOREF is coded as 0 if the respondent reports that they did not receive help with chores from their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives during the COVID-19 pandemic. RrCROCHOREF is coded as 1 if the respondent reports that they received help with chores from their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives less often compared to the specified timeframes. RrCROCHOREF is coded as 2 if the respondent reports that they received help with chores from their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives about the same amount as the specified timeframes. RrCROCHOREF is coded as 3 if the respondent reports that they received help with chores from their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives more often compared to the specified timelines. RrCROCHOREF is coded to prioritize responses of more frequent help to no help. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCROCHOREF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRCHOREF indicates the frequency the respondent received help with chores, such as obtaining necessities like food, medication, or emergency household repairs, from anyone living outside their household compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the help received in the last three months compared to the first wave of the pandemic. Anyone outside their household includes non-co-residing children, non-co-residing parents, other non-co-residing relatives (not including children or parents), and non-co-residing non-relatives. RrCRCHOREF summarizes the information received in RrCRCHOREF, RrCRPCHOREF, and RrCROCHOREF. RrCRCHOREF is coded as 0 if the respondent reports that they did not receive help with chores from anyone living outside their household during the COVID-19 pandemic. RrCRCHOREF is coded as 1 if the respondent reports that they received help with chores from anyone living outside of their household less often compared to the specified timeframes. RrCRCHOREF is coded as 2 if the respondent reports that they received help with chores from anyone living outside of their household about the same amount as the specified timeframes. RrCRCHOREF is coded as 3 if the respondent reports that they received help with chores from anyone living outside of their household more often compared to the specified timeframes. RrCRCHOREF is coded to prioritize responses of more frequent help to no help. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCHOREF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFRCHOREF is a flag variable that indicates whether responses to RrCRCHOREF are imputed by SHARE. RrCFRCHOREF summarizes the information received by RrCFRCHOREF, RrCFRCHOREF, and RrCFRCHOREF. RrCFRCHOREF is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFRCHOREF is coded as plain missing (.) if the respondent did not participate in the current round. Please refer to RrCFRCHOREF, RrCFRCHOREF, and RrCFRCHOREF to see whether responses to RrCRCHOREF, RrCRPCHOREF, and RrCROCHOREF, respectively, are imputed by SHARE.

SrCRCHORE indicates whether the respondent's spouse received help with chores, such as obtaining necessities like food, medications, or emergency household repairs, from anyone living outside their household during the COVID-19 pandemic. SrCRCHORE is a flag variable that indicates whether responses to SrCRCHORE are imputed by SHARE. SrCRCHORE indicates whether the respondent's spouse received help with chores, such as obtaining necessities like food, medications, or emergency household repairs, from their non-co-residing children during the COVID-19 pandemic. SrCFRCHORE is a flag variable that indicates whether responses to SrCRCHORE are imputed by SHARE. SrCRPCHORE indicates whether the respondent's spouse received help with chores, such as obtaining necessities like food, medications, or emergency household repairs, from their non-co-residing parents during the COVID-19 pandemic. SrCFRCHORE is a flag variable that indicates whether responses to SrCRPCHORE are imputed by SHARE. SrCROCHORE indicates whether the respondent's spouse received help with chores, such as obtaining necessities like food, medications, or emergency household repairs, from their non-co-residing relatives (not including their children or parents) or non-co-residing non-relatives during the COVID-19 pandemic. SrCFRCHORE is a flag variable that indicates whether responses to SrCROCHORE are imputed by SHARE. SrCRCHOREF indicates how often the respondent's spouse received help with chores, such as obtaining necessities like food, medication, or emergency household repairs, from their non-co-residing children compared to previously.

SrCRPCHOREF indicates how often the respondent's spouse received help with chores, such as obtaining necessities like food, medication, or emergency household repairs, from their non-co-residing parents compared to previously. SrcROCHOREF indicates how often the respondent's spouse received help with chores, such as obtaining necessities like food, medication, or emergency household repairs, from their non-co-residing relatives (not including their children or parents) or non-co-residing non-relatives compared to previously. SrcRCHOREF indicates how often the respondent's spouse received help with chores, such as obtaining necessities like food, medication, or emergency household repairs, from anyone living outside their household compared to previously. SrcFRCHOREF is a flag variable that indicates whether responses to SrcRCHOREF are imputed by SHARE. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are first asked to report whether they have been helped by others living outside their household with chores, such as obtaining necessities like food, medications, or emergency household repairs. If the respondent reports that they have been helped by others living outside their household with chores, they are then asked to report who they were helped by and whether that help was "less often", "about the same", "more often", or "not applicable" compared to before the Corona outbreak. Relationships include non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues.

At Round 2, respondents are first asked to separately report whether they have been helped by their non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues with chores, such as obtaining necessities like food, medications, or emergency household repairs. If the respondent reports that they have been helped by their non-co-residing children, non-co-residing parents, other non-co-residing relatives, or other non-co-residing non-relatives with chores, they are then asked to separately report whether that help in the last three months was "less often", "about the same", or "more often" compared to the first wave of the pandemic.

## Differences with the Harmonized HRS COVID

The HRS COVID asks questions about receiving help with chores during the pandemic to respondents and their spouses whereas the SHARE Corona survey asks these questions to the respondent. Due to the difference in unit of observation, HrcRCHORE, HrcRCCHORE, and HrcROCHORE are used in the Harmonized HRS COVID to indicate couple-level, and RrcRCHORE, RrcRCCHORE, RrcRPCHORE, and RrcROCHORE are used in the Gateway Harmonized SHARE COVID to indicate respondent-level.

Additionally, relationships in the HRS COVID and the SHARE Corona survey are categorized differently. The HRS COVID asks whether the respondent and spouse received any help with chores from non-co-residing children (including grandchildren) in both rounds or children-in-law (including grandchildren-in-law) in Round 1 only, but the SHARE Corona survey only asks about non-co-residing children. The SHARE Corona survey also asks respondents to report whether they have received any help with chores from non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues separately, but the HRS COVID collapses non-co-residing parents and other non-co-residing relatives into one category and asks about friends, neighbors/other non-relatives, and other individuals separately. Thus, the Gateway Harmonized SHARE COVID includes RrcRPCHORE, which refers to non-co-residing parents, and RrcROCHORE, which refers to non-co-residing parents, other non-co-residing relatives (not including children or parents) and non-co-residing non-relatives (neighbors, friends, or colleagues), while the Harmonized HRS COVID includes HrcROCHORE, which includes non-co-residing parents, relatives, and non-relatives.

Chores in Round 1 of the HRS COVID include shopping for groceries, errands, rides, or chores and chores in Round 2 of the HRS COVID include helping with money or paying bills; shopping for groceries, errands, rides, or chores; or with advice, encouragement, moral or emotional support. Chores in the SHARE Corona survey refer to obtaining necessities such as food, medications, or emergency household repairs.

Unlike the SHARE Corona survey, the HRS COVID does not ask about the frequency that the respondent and their spouses received help with chores from non-co-residing children/children-in-law, parents,

relatives, and non-relatives. The HRS COVID also does not provide imputed values as part of its public release.

### Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### SHARE Variables Used:

#### Round 1 Covid-19:

|           |                                                              |

### How Constructed:

At Round 1, respondents are first asked to report whether they have provided personal care to others living outside their household since the Corona outbreak. If the respondent reports that they have

provided others living outside their household with personal care, they are then asked to report who they provided personal care for and whether that care was "less often", "about the same", "more often", or "not applicable" compared to before the Corona outbreak. Relationships include non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives. At Round 2, respondents are first asked to separately report whether they have provided personal care to their non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues since the Corona outbreak. If the respondent reports that they have provided their non-co-residing children, non-co-residing parents, other non-co-residing relatives, or other non-co-residing non-relatives with personal care, they are then asked to report whether the personal care they provided in the last three months was "less often", "about the same", or "more often" compared to the first wave of the pandemic.

RrCGCAANY indicates whether the respondent provided personal care to anyone living outside their household during the COVID-19 pandemic. At Round 1, RrCGCAANY is coded as 0 if the respondent reports that they did not provide help with personal care to anyone living outside their household since the COVID-19 outbreak. RrCGCAANY is coded as 1 if the respondent reports that they provided personal care to anyone living outside their household since the COVID-19 outbreak. At Round 2, RrCGCAANY is coded as 0 if the respondent reports that they did not provide help with personal care to their non-co-residing children, non-co-residing parents, other non-co-residing relatives, or other non-co-residing non-relatives since the COVID-19 outbreak. RrCGCAANY is coded as 1 if the respondent reports that they provided personal care to their non-co-residing children, non-co-residing parents, other non-co-residing relatives, or other non-co-residing non-relatives since the COVID-19 outbreak. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGCAANY is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFGCAANY is a flag variable that indicates whether responses to RrCGCAANY are imputed by SHARE. RrCFGCAANY is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFGCAANY is coded as plain missing (.) if the respondent did not participate in the current round.

RrCGCCARE indicates whether the respondent provided personal care to their non-co-residing children during the COVID-19 pandemic. At Round 1, RrCGCCARE is coded as 0 if the respondent reports that they did not provide personal care to anyone living outside their household since the COVID-19 outbreak or that providing personal care to their non-co-residing children was not applicable to their situation. RrCGCCARE is coded as 1 if the respondent reports that they provided personal care to their non-co-residing children less often, about the same, or more often compared to before the pandemic. At Round 2, RrCGCCARE is coded as 0 if the respondent reports that they did not provide personal care to their non-co-residing children since the COVID-19 outbreak or that providing personal care to their non-co-residing children was not applicable to their situation. RrCGCCARE is coded as 1 if the respondent reports that they provided personal care to their non-co-residing children since the COVID-19 outbreak. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGCCARE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFGCCARE is a flag variable that indicates whether responses to RrCGCCARE are imputed by SHARE. RrCFGCCARE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFGCCARE is coded as plain missing (.) if the respondent did not participate in the current round.

RrCGPCARE indicates whether the respondent provided personal care to their non-co-residing parents during the COVID-19 pandemic. At Round 1, RrCGPCARE is coded as 0 if the respondent reports that they did not provide personal care to anyone living outside their household since the COVID-19 outbreak or that providing personal care to their non-co-residing parents was not applicable to their situation. RrCGPCARE is coded as 1 if the respondent reports that they provided personal care to their non-co-residing parents less often, about the same, or more often compared to before the COVID-19 outbreak. At Round 2, RrCGPCARE is coded as 0 if the respondent reports that they did not provide personal care to their non-co-residing parents since the COVID-19 outbreak or that providing personal care to their non-co-residing parents was not applicable to their situation. RrCGPCARE is coded as 1 if the respondent reports that they provided personal care to their non-co-residing parents since the COVID-19 outbreak. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGPCARE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFGPCARE is a flag variable that indicates whether responses to RrCGPCARE are imputed by SHARE. RrCFGPCARE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFGPCARE is coded as plain missing (.) if the respondent did not participate in the current round.

RrCGOCARE indicates whether the respondent provided personal care to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives during the COVID-19 pandemic. At Round 1, RrCGOCARE is coded as 0 if the respondent reports that they did not provide personal care to anyone living outside their household since the COVID-19 outbreak or that providing personal care to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives was not applicable to their situation. RrCGOCARE is coded as 1 if the respondent reports that they provided personal care to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives less often, about the same, or more often compared to before the COVID-19 outbreak. At Round 2, RrCGOCARE is coded as 0 if the respondent reports that they did not provide personal care to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives since the COVID-19 outbreak or that providing personal care to their non-co-residing relatives or non-co-residing non-relatives was not applicable to their situation. RrCGOCARE is coded as 1 if the respondent reports that they provided personal care to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives since the COVID-19 outbreak. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGOCARE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFGOCARE is a flag variable that indicates whether responses to RrCGOCARE are imputed by SHARE. RrCFGOCARE is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFGOCARE is coded as plain missing (.) if the respondent did not participate in the current round.

RrCGCCAREF indicates the frequency the respondent provided personal care to their non-co-residing children compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the personal care provided in the last three months compared to the first wave of the pandemic. In both rounds, RrCGCCAREF is coded as 0 if the respondent reports that they did not provide personal care to their non-co-residing children during the COVID-19 pandemic. RrCGCCAREF is coded as 1 if the respondent reports that they provided personal care to their non-co-residing children less often compared to the specified timeframes. RrCGCCAREF is coded as 2 if the respondent reports that they provided personal care to their non-co-residing children about the same amount as the specified timeframes. RrCGCCAREF is coded as 3 if the respondent reports that they provided personal care to their non-co-residing children more often compared to the specified timeframes. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGCCAREF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCGPCAREF indicates the frequency the respondent provided personal care to their non-co-residing parents compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the personal care provided in the last three months compared to the first wave of the pandemic. In both rounds, RrCGPCAREF is coded as 0 if the respondent reports that they did not provide personal care to their non-co-residing parents during the COVID-19 pandemic. RrCGPCAREF is coded as 1 if the respondent reports that they provided personal care to their non-co-residing parents less often compared to the specified timeframes. RrCGPCAREF is coded as 2 if the respondent reports that they provided personal care to their non-co-residing parents about the same amount as the specified timeframes. RrCGPCAREF is coded as 3 if the respondent reports that they provided personal care to their non-co-residing parents more often compared to the specified timeframes. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGPCAREF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCGOCAREF indicates the frequency the respondent provided personal care to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the personal care provided in the last three months compared to the first wave of the pandemic. In both rounds, RrCGOCAREF is coded as 0 if the respondent reports that they did not provide personal care to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives during the COVID-19 pandemic. RrCGOCAREF is coded

as 1 if the respondent reports that they provided personal care to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives less often compared to the specified timeframes. RrCGOCAREF is coded as 2 if the respondent reports that they provided personal care to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives about the same amount as the specified timeframes. RrCGOCAREF is coded as 3 if the respondent reports that they provided personal care to their non-co-residing parents, non-co-residing relatives (not including children or parents) or non-co-residing non-relatives more often compared to the specified timeframes. RrCGOCAREF is coded to prioritize responses of more frequent help to no help. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGOCAREF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCGCAANYF indicates the frequency the respondent provided personal care to anyone living outside their household compared to previously. At Round 1, the timeframe compares to before the outbreak of COVID-19 and at Round 2, the timeframe references the personal care provided in the last three months compared to the first wave of the pandemic. Anyone outside their household includes non-co-residing children, non-co-residing parents, other non-co-residing relatives (not including children or parents), and non-co-residing non-relatives. RrCGCAANYF summarizes the information provided in RrCGCCAREF, RrCGPCAREF, and RrCGOCAREF. In both rounds, RrCGCAANYF is coded as 0 if the respondent reports that they did not provide personal care to anyone living outside their household during the COVID-19 pandemic. RrCGCAANYF is coded as 1 if the respondent reports that they provided personal care to anyone living outside of their household less often compared to the specified timeframes. RrCGCAANYF is coded as 2 if the respondent reports that they provided personal care to anyone living outside of their household about the same amount as the specified timeframes. RrCGCAANYF is coded as 3 if the respondent reports that they provided personal care to anyone living outside of their household more often compared to the specified timeframes. RrCGCAANYF is coded to prioritize responses of more frequent help to no help. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCGCAANYF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFGCAANYF is a flag variable that indicates whether responses to RrCGCAANYF are imputed by SHARE. RrCFGCAANYF summarizes the information provided by RrCFGCCARE, RrCFGPCARE, and RrCFGOCARE. RrCFGCAANYF is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFGCAANYF is coded as plain missing (.) if the respondent did not participate in the current round. Please refer to RrCFGCCARE, RrCFGPCARE, and RrCFGOCARE to see whether responses to RrCGCCAREF, RrCGPCAREF, and RrCGOCAREF, respectively, are imputed by SHARE.

SrCGCAANY indicates whether the respondent's spouse provided personal care to anyone living outside their household during the COVID-19 pandemic. SrCFGCAANY is a flag variable that indicates whether responses to SrCGCAANY are imputed by SHARE. SrCGCCARE indicates whether the respondent's spouse provided personal care to their non-co-residing children during the COVID-19 pandemic. SrCFGCCARE is a flag variable that indicates whether responses to SrCGCCARE are imputed by SHARE. SrCGPCARE indicates whether the respondent's spouse provided personal care to their non-co-residing parents during the COVID-19 pandemic. SrCFGPCARE is a flag variable that indicates whether responses to SrCGPCARE are imputed by SHARE. SrCGOCARE indicates whether the respondent's spouse provided personal care to their non-co-residing relatives (not including their children or parents) or non-co-residing non-relatives during the COVID-19 pandemic. SrCFGOCARE is a flag variable that indicates whether responses to SrCGOCARE are imputed by SHARE. SrCGCCAREF indicates how often the respondent's spouse provided personal care to their non-co-residing children compared to previously. SrCGPCAREF indicates how often the respondent's spouse provided personal care to their non-co-residing parents compared to previously. SrCGOCAREF indicates how often the respondent's spouse provided personal care to their non-co-residing relatives (not including their children or parents) or non-co-residing non-relatives compared to previously. SrCGCAANYF indicates how often the respondent's spouse provided personal care to anyone living outside their household compared to previously. SrCFGCAANYF is a flag variable that indicates whether responses to SrCGCAANYF are imputed by SHARE. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are first asked to report whether they have provided personal care to others living outside their household since the Corona outbreak. If the respondent reports that they have provided others living outside their household with personal care, they are then asked to report who they provided personal care for and whether that care was "less often", "about the same", "more often", or "not applicable" compared to before the Corona outbreak. Relationships include non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives.

At Round 2, respondents are first asked to separately report whether they have provided personal care to their non-co-residing children, non-co-residing parents, other non-co-residing relatives, and other non-co-residing non-relatives like neighbors, friends, or colleagues since the Corona outbreak. If the respondent reports that they have provided their non-co-residing children, non-co-residing parents, other non-co-residing relatives, or other non-co-residing non-relatives with personal care, they are then asked to report whether that personal care they provided in the last three months was "less often", "about the same", or "more often" compared to the first wave of the pandemic.

### Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents whether they provided personal care since the outbreak of COVID-19, but the core survey asks whether they provided personal care to their parents. In the Harmonized HRS, HwGAPCARE indicates whether the respondent or their spouse provides personal care to their parents, HwGPCHORE indicates whether the respondent or their spouse provides help with chores to their parents, and HwGPCARE indicates whether the respondent or their spouse provides personal care or help with chores to their parents.

### Comparability with the Gateway Harmonized SHARE

RrCGCAANY: This variable is comparable to RwgCAANY in the Gateway Harmonized SHARE.

### SHARE Variables Used:

#### Round 1 Covid-19:

|            |                                                         |
|------------|---------------------------------------------------------|
| AGPCARE1   | Social: pers. care provided to own children since outbr |
| AGPCARE1_F | Social: pers. care provided to own children since outbr |
| AGPCARE2   | Social: pers. care provided to own parents since outbre |
| AGPCARE2_F | Social: pers. care provided to own parents since outbre |
| AGPCARE3   | Social: pers. care provided to other relatives since ou |
| AGPCARE3_F | Social: pers. care provided to other relatives since ou |
| AGPCARE4   | Social: pers. care provided to others since outbreak    |
| AGPCARE4_F | Social: pers. care provided to others since outbreak -  |
| GPCARE     | Social: provided pers. care outside home since outbreak |
| GPCARE_F   | Social: provided pers. care outside home since outbreak |

#### Round 2 Covid-19:

|          |                                                         |
|----------|---------------------------------------------------------|
| CAS112_1 | Social: provided personal care to own children outside  |
| CAS112_2 | Social: provided personal care to own parents outside h |
| CAS112_3 | Social: provided personal care to other relatives outsi |
| CAS112_4 | Social: provided personal care to neighbors/friends/col |

### How Constructed:

At Round 2, respondents are asked a series of questions related to receiving care from others living outside their household during the last three months. Respondents are first asked to report whether they have regularly received home care from someone living outside their household during the last three months. If the respondent reports that they have regularly received home care from someone living outside their household during the last three months, they are then asked to report whether they received home care from their non-co-residing children, non-co-residing parents, other non-co-residing relatives, other non-co-residing non-relatives like neighbors, friends, or colleagues, and non-co-residing professional

care providers during the last three months. If the respondent reports that they received home care from any of the relationships during the last three months, they are then asked to report whether the home care they received in the last three months was "less often", "about the same", or "more often" compared to the first wave of the pandemic. These questions are not asked in Round 1.

RrCRCANY indicates whether the respondent regularly received home care from anyone living outside their household during the last three months. RrCRCANY is coded as 0 if the respondent reports that they did not regularly receive home care from anyone living outside their household during the last three months. RrCRCANY is coded as 1 if the respondent reports that they regularly received home care from someone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCANY is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRCCARE indicates whether the respondent regularly received home care from their non-co-residing children during the last three months. RrCRCCARE is coded as 0 if the respondent reports that they did not regularly receive home care from their non-co-residing children during the last three months. RrCRCCARE is coded as 1 if the respondent reports that they regularly received home care from their non-co-residing children during the last three months. Special missing (.h) is assigned if the respondent reported that they did not regularly receive home care from anyone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCCARE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRRRCARE indicates whether the respondent regularly received home care from their non-co-residing relatives (parents or other relatives) during the last three months. RrCRRRCARE is coded as 0 if the respondent reports that they did not regularly receive home care from their non-co-residing relatives (parents or other relatives) during the last three months. RrCRRRCARE is coded as 1 if the respondent reports that they received regular home care from their non-co-residing relatives (parents or other relatives) during the last three months. Special missing (.h) is assigned if the respondent reported that they did not regularly receive home care from anyone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRRRCARE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRFCARE indicates whether the respondent regularly received home care from their non-co-residing non-relatives (neighbors, friends, or colleagues) during the last three months. RrCRFCARE is coded as 0 if the respondent reports that they did not regularly receive home care from their non-co-residing non-relatives during the last three months. RrCRFCARE is coded as 1 if the respondent reports that they received regular home care from their non-co-residing non-relatives during the last three months. Special missing (.h) is assigned if the respondent reported that they did not regularly receive home care from anyone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRFCARE is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRCAANY indicates whether the respondent regularly received informal home care during the last three months. Informal home care is defined as care provided by anyone besides a professional care provider, including their non-co-residing children, non-co-residing parents, other non-co-residing relatives, or non-co-residing non-relatives. RrCRCAANY summarizes the information found in RrCRCCARE, RrCRRRCARE, and RrCRFCARE. RrCRCAANY is coded as 0 if the respondent reports that they did not regularly receive informal home care during the last three months. RrCRCAANY is coded as 1 if the respondent reports that they received regular informal home care during the last three months. Special missing (.h) is assigned if the respondent reported that they did not regularly receive home care from anyone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCAANY is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRFAANY indicates whether the respondent regularly received formal home care during the last three months. Formal home care is defined as care provided by a professional care provider. RrCRFAANY is coded as 0 if the respondent reports that they did not regularly receive formal home care during the last three months. RrCRFAANY is coded as 1 if the respondent reports that they received regular formal home care during the last three months. Special missing (.h) is assigned if the respondent reported that they did not regularly receive home care from anyone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m),

respectively. RrCRFAANY is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRCCAREDC indicates the frequency the respondent received home care from their non-co-residing children during the last three months compared to the first wave of the pandemic. RrCRCCAREDC is coded as 0 if the respondent reports that they did not receive home care from their non-co-residing children during the last three months. RrCRCCAREDC is coded as 1 if the respondent reports that they received home care from their non-co-residing children less often compared to the first wave of the pandemic. RrCRCCAREDC is coded as 2 if the respondent reports that they received home care from their non-co-residing children about the same amount as they did during the first wave of the pandemic. RrCRCCAREDC is coded as 3 if the respondent reports that they received home care from their non-co-residing children more often compared to the first wave of the pandemic. Special missing (.h) is assigned if the respondent reports that they did not regularly receive home care from anyone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCCAREDC is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRRCAREDC indicates the frequency the respondent received home care from their non-co-residing relatives (parents or other relatives) during the last three months compared to the first wave of the pandemic. RrCRRCAREDC is coded as 0 if the respondent reports that they did not receive home care from their non-co-residing relatives (parents or other relatives) during the last three months. RrCRRCAREDC is coded as 1 if the respondent reports that they received home care from their non-co-residing relatives (parents or other relatives) less often compared to the first wave of the pandemic. RrCRRCAREDC is coded as 2 if the respondent reports that they received home care from their non-co-residing relatives (parents or other relatives) about the same amount as they did during the first wave of the pandemic. RrCRRCAREDC is coded as 3 if the respondent reports that they received home care from their non-co-residing relatives (parents or other relatives) more often compared to the first wave of the pandemic. Special missing (.h) is assigned if the respondent reports that they did not regularly receive home care from anyone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRRCAREDC is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRFCAREDC indicates the frequency the respondent received home care from their non-co-residing non-relatives (neighbors, friends, or colleagues) during the last three months compared to the first wave of the pandemic. RrCRFCAREDC is coded as 0 if the respondent reports that they did not receive home care from their non-co-residing non-relatives during the last three months. RrCRFCAREDC is coded as 1 if the respondent reports that they received home care from their non-co-residing non-relatives less often compared to the first wave of the pandemic. RrCRFCAREDC is coded as 2 if the respondent reports that they received home care from their non-co-residing non-relatives about the same amount as they did during the first wave of the pandemic. RrCRFCAREDC is coded as 3 if the respondent reports that they received home care from their non-co-residing non-relatives more often compared to the first wave of the pandemic. Special missing (.h) is assigned if the respondent reports that they did not regularly receive home care from anyone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRFCAREDC is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRICAREDC indicates the frequency the respondent received informal home care during the last three months compared to the first wave of the pandemic. Informal home care is defined as care provided by anyone besides a professional care provider, including their non-co-residing children, non-co-residing parents, other non-co-residing relatives, or non-co-residing non-relatives. RrCRICAREDC summarizes the information found in RrCRCCAREDC, RrCRRCAREDC, and RrCRFCAREDC. RrCRICAREDC is coded as 0 if the respondent reports that they did not receive informal home care during the last three months. RrCRICAREDC is coded as 1 if the respondent reports that they received informal home care less often compared to the first wave of the pandemic. RrCRICAREDC is coded as 2 if the respondent reports that they received informal home care about the same amount as they did during the first wave of the pandemic. RrCRICAREDC is coded as 3 if the respondent reports that they received informal home care more often compared to the first wave of the pandemic. RrCRICAREDC is coded to prioritize responses of more frequent help to no help. Special missing (.h) is assigned if the respondent reports that they did not regularly receive home care from anyone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRICAREDC is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRPCAREDC indicates the frequency the respondent received formal home care during the last three months compared to the first wave of the pandemic. Formal home care is defined as care provided by a professional care provider. RrCRPCAREDC is coded as 0 if the respondent reports that they did not receive formal home care during the last three months. RrCRPCAREDC is coded as 1 if the respondent reports that they received formal home care less often compared to the first wave of the pandemic. RrCRPCAREDC is coded as 2 if the respondent reports that they received formal home care about the same amount as they did during the first wave of the pandemic. RrCRPCAREDC is coded as 3 if the respondent reports that they received formal home care more often compared to the first wave of the pandemic. Special missing (.h) is assigned if the respondent reports that they did not regularly receive home care from anyone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRPCAREDC is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRCAREDC indicates the frequency the respondent received home care of any kind during the last three months compared to the first wave of the pandemic. RrCRCAREDC summarizes the information found in RrCRCCAREDC, RrCRRCAREDC, RrCRFCAREDC, and RrCRPCAREDC. RrCRCAREDC is coded as 0 if the respondent reports that they did not receive home care from a professional care provider or from their non-co-residing children, non-co-residing relatives (including parents or other relatives), or non-co-residing non-relatives during the last three months. RrCRCAREDC is coded as 1 if the respondent reports that they received home care from anyone living outside their household less often compared to the first wave of the pandemic. RrCRCAREDC is coded as 2 if the respondent reports that they received home care from anyone living outside their household about the same amount as they did during the first wave of the pandemic. RrCRCAREDC is coded as 3 if the respondent reports that they received home care from anyone living outside their household more often compared to the first wave of the pandemic. RrCRCAREDC is coded to prioritize responses of more frequent help to no help. Special missing (.h) is assigned if the respondent reports that they did not regularly receive home care from anyone living outside their household during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCAREDC is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCRCANY indicates whether the respondent's spouse regularly received home care from anyone living outside their household during the last three months. SrCRCCARE indicates whether the respondent's spouse regularly received home care from their non-co-residing children during the last three months. SrCRRCARE indicates whether the respondent's spouse regularly received home care from their non-co-residing relatives (parents or other relatives) during the last three months. SrCRFCARE indicates whether the respondent's spouse regularly received home care from their non-co-residing non-relatives (neighbors, friends, or colleagues) during the last three months. SrCRCAANY indicates whether the respondent's spouse regularly received informal home care during the last three months. SrCRFAANY indicates whether the respondent's spouse regularly received formal home care during the last three months. SrCRCCAREDC indicates how often the respondent's spouse received home care from their non-co-residing children during the last three months compared to their previous interview. SrCRRCAREDC indicates how often the respondent's spouse received home care from their non-co-residing relatives (parents or other relatives) during the last three months compared to their previous interview. SrCRFCAREDC indicates how often the respondent's spouse received home care from their non-co-residing non-relatives (neighbors, friends, or colleagues) during the last three months compared to their previous interview. SrCRICAREDC indicates how often the respondent's spouse received informal home care during the last three months compared to their previous interview. SrCRPCAREDC indicates how often the respondent's spouse received formal home care during the last three months compared to their previous interview. SrCRCAREDC indicates how often the respondent's spouse received home care of any kind during the last three months compared to their previous interview. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

Questions related to receiving care during the COVID-19 pandemic were added to the SHARE Corona survey at Round 2, so RrCRCANY, RrCRCCARE, RrCRRCARE, RrCRFCARE, RrCRFAANY, RrCRCAANY, RrCRCCAREDC, RrCRRCAREDC, RrCRFCAREDC, RrCRPCAREDC, RrCRICAREDC, and RrCRCAREDC are not available at Round 1.

## Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents whether they received home care during the last three months.

## Comparability with the Gateway Harmonized SHARE

RrCRCANY: This variable is comparable to RwRCANY in the Gateway Harmonized SHARE, which also includes HwRCANY, which indicates whether the respondent and/or spouse received any formal or informal care in the last year, and other related variables.

RrCRCCARE: This variable is comparable to RwRCCARE in the Gateway Harmonized SHARE, which also includes HwRCCARE, which indicates whether the respondent received any informal care from a child, child-in-law, or grandchild, either from outside or inside the household in the last year, and other related variables.

RrCRRRCARE: This variable is comparable to RwRRCARE in the Gateway Harmonized SHARE, which also includes HwRRCARE, which indicates whether the respondent received any informal care from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative, either from outside or inside the household in the last year, and other related variables.

RrCRFCARE: This variable is comparable to RwRFCARE in the Gateway Harmonized SHARE, which also includes HwRFCARE, which indicates whether the respondent received any informal care from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type, either from outside or inside the household in the last year, and other related variables.

RrCRCAANY: This variable is comparable to RwRCAANY in the Gateway Harmonized SHARE, which also includes HwRCAANY, which indicates whether the respondent and/or spouse received any informal care from outside or inside the household in the last year, and other related variables.

RrCRFAANY: This variable is comparable to RwRFAANY in the Gateway Harmonized SHARE, which also includes HwRFAANY, which indicates whether the respondent and/or spouse received any formal care in their home in the last year, and other related variables.

RrCRCCAREDC: This variable is related to RwRCCARED\_S, which indicates the greatest frequency at which the respondent received informal care from a child, child-in-law, or grandchild in the past year, in the Gateway Harmonized SHARE, which includes other related variables.

RrCRRRCAREDC: This variable is related to RwRRCARED\_S, which indicates the greatest frequency at which the respondent received informal care from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative in the past year, in the Gateway Harmonized SHARE, which includes other related variables.

RrCRFCAREDC: This variable is related to RwRFCARED\_S, which indicates the greatest frequency at which the respondent received informal care from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type in the past year, in the Gateway Harmonized SHARE, which includes other related variables.

RrCRPCAREDC: This variable is related to RwRPCARED\_S, which indicates the greatest frequency at which the respondent reported receiving informal care from a therapist or other professional helper, or a housekeeper/home health care provider in the past year, in the Gateway Harmonized SHARE, which includes other related variables.

### How Constructed:

At Round 1, respondents are asked how often they had personal contact (face to face) with their non-co-residing children since the outbreak of COVID-19. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing children since the outbreak of COVID-19. At Round 2, respondents are asked how often they had personal contact with their non-co-residing children during the last three months. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing children during the last three months. At Rounds 1 and 2, respondents can report that they had in-person or electronic contact with their non-co-residing children "daily", "several times a week", "about once a week", "less often", or "never".

RrCKCNTFX indicates how often the respondent had in-person contact with their non-co-residing children during the COVID-19 pandemic. At Round 1, the timeframe references "since the outbreak of Corona" and at

Round 2, the timeframe refers to the "last three months". RrCKCNTFX is coded as 1 if the respondent reports that they had in-person contact with their children daily. RrCKCNTFX is coded as 2 if the respondent reports that they had in-person contact with their children several times a week. RrCKCNTFX is coded as 3 if the respondent reports that they had in-person contact with their children about once a week. RrCKCNTFX is coded as 4 if the respondent reports that they had in-person contact with their children less often. RrCKCNTFX is coded as 5 if the respondent reports that they never had in-person contact with their children. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCKCNTFX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFKCNTFX is a flag variable that indicates whether responses to RrCKCNTFX are imputed by SHARE. RrCFKCNTFX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFKCNTFX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCKCNTF indicates whether the respondent has had any frequent (i.e., at least weekly) in-person contact with their non-co-residing children during the COVID-19 pandemic. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". Weekly contact is defined as the respondent contacting their children daily, several times a week, or about once a week. RrCKCNTF is coded as 0 if the respondent reports that they did not have weekly in-person contact with their children. RrCKCNTF is coded as 1 if the respondent reports that they did have weekly in-person contact with their children. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCKCNTF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCKCNTPMX indicates how often the respondent had contact with their non-co-residing children by phone, email, or other electronic means during the COVID-19 pandemic. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCKCNTPMX is coded as 1 if the respondent reports that they had electronic contact with their children daily. RrCKCNTPMX is coded as 2 if the respondent reports that they had electronic contact with their children several times a week. RrCKCNTPMX is coded as 3 if the respondent reports that they had electronic contact with their children about once a week. RrCKCNTPMX is coded as 4 if the respondent reports that they had electronic contact with their children less often. RrCKCNTPMX is coded as 5 if the respondent reports that they never had electronic contact with their children. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCKCNTPMX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFKCNTPMX is a flag variable that indicates whether responses to RrCKCNTPMX are imputed by SHARE. RrCFKCNTPMX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFKCNTPMX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCKCNTPM indicates whether the respondent has had any frequent (i.e., at least weekly) contact with their non-co-residing children by phone, email, or other electronic means during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting their children daily, several times a week, or about once a week. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCKCNTPM is coded as 0 if the respondent reports that they did not have weekly electronic contact with their children. RrCKCNTPM is coded as 1 if the respondent reports that they did have weekly electronic contact with their children. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCKCNTPM is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCKCNTX indicates how often the respondent had contact of any kind (in-person, by phone, email, or other electronic means) with their non-co-residing children during the COVID-19 pandemic. RrCKCNTX summarizes the information found in RrCKCNTFX and RrCKCNTPMX. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCKCNTX is coded as 1 if the respondent reports that they had in-person or electronic contact with their children daily.

RrCKCNTX is coded as 2 if the respondent reports that they had in-person or electronic contact with their children several times a week. RrCKCNTX is coded as 3 if the respondent reports that they had in-person or electronic contact with their children about once a week. RrCKCNTX is coded as 4 if the respondent reports that they had in-person or electronic contact with their children less often. RrCKCNTX is coded as 5 if the respondent reports that they never had in-person or electronic contact with their children. RrCKCNTX prioritizes the assignment of values from most frequent to least frequent contact. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCKCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFKCNTX is a flag variable that indicates whether responses to RrCKCNTX are imputed by SHARE. RrCFKCNTX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFKCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCKCNT indicates whether the respondent has had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with their non-co-residing children during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting their children daily, several times a week, or about once a week. RrCKCNT summarizes the information found in RrCKCNTF and RrCKCNTPM. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCKCNT is coded as 0 if the respondent reports that they did not have weekly in-person or electronic contact with their children. RrCKCNT is coded as 1 if the respondent reports that they did have weekly in-person or electronic contact with their children. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCKCNT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCKCNTFX indicates how often the respondent's spouse had in-person contact with their non-co-residing children during the COVID-19 pandemic. SrCFKCNTFX is a flag variable that indicates whether responses to SrCKCNTFX are imputed by SHARE. SrCKCNTF indicates whether the respondent's spouse had any frequent (i.e., at least weekly) in-person contact with their non-co-residing children during the COVID-19 pandemic. SrCKCNTPMX indicates how often the respondent's spouse had contact with their non-co-residing children by phone, email, or other electronic means during the COVID-19 pandemic. SrCFKCNTPMX is a flag variable that indicates whether responses to SrCKCNTPMX are imputed by SHARE. SrCKCNTPM indicates whether the respondent's spouse has any frequent (i.e., at least weekly) contact with their non-co-residing children by phone, email, or other electronic means during the COVID-19 pandemic. SrCKCNTX indicates how often the respondent's spouse had contact of any kind (in-person, by phone, email, or other electronic means) with their non-co-residing children during the COVID-19 pandemic. SrCFKCNTX is a flag variable that indicates whether responses to SrCKCNTX are imputed by SHARE. SrCKCNT indicates whether the respondent's spouse had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with their non-co-residing children during the COVID-19 pandemic. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked how often they had personal contact (face to face) with their non-co-residing children since the outbreak of COVID-19. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing children since the outbreak of COVID-19.

At Round 2, respondents are asked how often they had personal contact with their non-co-residing children during the last three months. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing children during the last three months.

## Differences with the Harmonized HRS COVID

In the self-completion questionnaire of Round 1, the HRS COVID first asks whether respondents have any living children and if so, how often they contact non-co-residing children in person, by phone, mail, email, or social media on average. Round 2 of the HRS COVID does not ask these questions. Weekly contact in the Harmonized HRS COVID is defined as the respondent contacting their children three or more times a week, or once or twice a week. The SHARE Corona survey uses a slightly different definition: weekly contact is defined as the respondent contacting their children daily, several times a week, or about once a week.

At Rounds 1 and 2 of the HRS COVID, respondents are asked to report how the amount of electronic contact with their non-co-residing children changed during the pandemic compared to before the pandemic. At Round 2 only, the HRS COVID also asks respondents to report how the amount of in-person contact with their non-co-residing children changed during the pandemic compared to before the pandemic. These questions are not asked in the SHARE Corona survey. The HRS COVID does not provide imputed values as part of its public release.

The Gateway Harmonized SHARE COVID provides both categorical and binary variables to indicate the frequency of contact and whether respondents contact their own children outside their home through face to face contact, phone, email, or other electronic means. The Harmonized HRS COVID provides only binary variables to indicate whether respondents contact non-co-residing children weekly on average in person, by phone, mail, email, or social media, or in any way.

## Comparability with the Gateway Harmonized SHARE

RrCKCNT: This variable is related to HwKCNT in the Gateway Harmonized SHARE, which indicates whether the family respondent and their spouse have any frequent contact with any of their children in person, by phone, mail, e-mail, sms or mms.

RrCKCNTX: This variable is related to HwKCNTFR, which indicates the frequency with which the family respondent and their spouse have contact with any of their children in person, by phone, mail, e-mail, sms or mms, in the Gateway Harmonized SHARE. Please note that a slightly different scale is used to indicate the frequency.

## SHARE Variables Used:

### Round 1 Covid-19:

|          |                                                         |
|----------|---------------------------------------------------------|
| FECNT1   | Social: freq. electr. contacts own children since outbr |
| FECNT1_F | Social: freq. electr. contacts own children since outbr |
| FPCNT1   | Social: freq. pers. contacts own children since outbrea |
| FPCNT1_F | Social: freq. pers. contacts own children since outbrea |

### Round 2 Covid-19:

|          |                                                         |
|----------|---------------------------------------------------------|
| CAS103_1 | Social: contact frequency with own children during last |
| CAS104_1 | Social: electronic contact frequency with own children  |

|                                                                                   |
|-----------------------------------------------------------------------------------|
| <b>Contact with Parents in Person, by Phone, Email, or Other Electronic Means</b> |

### How Constructed:

At Round 1, respondents are asked how often they had personal contact (face to face) with their non-co-residing parents since the outbreak of COVID-19. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing parents since the outbreak of COVID-19. At Round 2, respondents are asked how often they had personal contact with their non-co-residing parents during the last three months. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing parents during the last three months. At Rounds 1 and 2, respondents can report that they had in-person or electronic contact with their non-co-residing parents "daily", "several times a week", "about once a week", "less often", or "never".

RrCPCNTFX indicates how often the respondent had in-person contact with their non-co-residing parents during the COVID-19 pandemic. At Round 1, the timeframe references "since the outbreak of Corona" and at

Round 2, the timeframe refers to the "last three months". RrCPCNTFX is coded as 1 if the respondent reports that they had in-person contact with their parents daily. RrCPCNTFX is coded as 2 if the respondent reports that they had in-person contact with their parents several times a week. RrCPCNTFX is coded as 3 if the respondent reports that they had in-person contact with their parents about once a week. RrCPCNTFX is coded as 4 if the respondent reports that they had in-person contact with their parents less often. RrCPCNTFX is coded as 5 if the respondent reports that they never had in-person contact with their parents. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCPCNTFX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFPCNTFX is a flag variable that indicates whether responses to RrCPCNTFX are imputed by SHARE. RrCFPCNTFX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFPCNTFX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCPCNTF indicates whether the respondent has had any frequent (i.e., at least weekly) in-person contact with their non-co-residing parents during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting their parents daily, several times a week, or about once a week. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCPCNTF is coded as 0 if the respondent reports that they did not have weekly in-person contact with their parents. RrCPCNTF is coded as 1 if the respondent reports that they did have weekly in-person contact with their parents. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCPCNTF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCPCNTPMX indicates how often the respondent had contact with their non-co-residing parents by phone, email, or other electronic means during the COVID-19 pandemic. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCPCNTPMX is coded as 1 if the respondent reports that they had electronic contact with their parents daily. RrCPCNTPMX is coded as 2 if the respondent reports that they had electronic contact with their parents several times a week. RrCPCNTPMX is coded as 3 if the respondent reports that they had electronic contact with their parents about once a week. RrCPCNTPMX is coded as 4 if the respondent reports that they had electronic contact with their parents less often. RrCPCNTPMX is coded as 5 if the respondent reports that they never had electronic contact with their parents. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCPCNTPMX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFPCNTPMX is a flag variable that indicates whether responses to RrCPCNTPMX are imputed by SHARE. RrCFPCNTPMX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFPCNTPMX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCPCNTPM indicates whether the respondent has had any frequent (i.e., at least weekly) contact with their non-co-residing parents by phone, email, or other electronic means during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting their parents daily, several times a week, or about once a week. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCPCNTPM is coded as 0 if the respondent reports that they did not have weekly electronic contact with their parents. RrCPCNTPM is coded as 1 if the respondent reports that they did have weekly electronic contact with their parents. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCPCNTPM is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCPCNTX indicates how often the respondent had contact of any kind (in-person, by phone, email, or other electronic means) with their non-co-residing parents during the COVID-19 pandemic. RrCPCNTX summarizes the information found in RrCPCNTFX and RrCPCNTPMX. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCPCNTX is coded as 1 if the respondent reports that they had in-person or electronic contact with their parents daily.

RrCPCNTX is coded as 2 if the respondent reports that they had in-person or electronic contact with their parents several times a week. RrCPCNTX is coded as 3 if the respondent reports that they had in-person or electronic contact with their parents about once a week. RrCPCNTX is coded as 4 if the respondent reports that they had in-person or electronic contact with their parents less often. RrCPCNTX is coded as 5 if the respondent reports that they never had in-person or electronic contact with their parents. RrCPCNTX prioritizes the assignment of values from most frequent to least frequent contact. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCPCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFPCNTX is a flag variable that indicates whether responses to RrCPCNTX are imputed by SHARE. RrCFPCNTX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFPCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCPCNT indicates whether the respondent has had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with their non-co-residing parents during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting their parents daily, several times a week, or about once a week. RrCPCNT summarizes the information found in RrCPCNTF and RrCPCNTPM. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCPCNT is coded as 0 if the respondent reports that they did not have weekly in-person or electronic contact with their parents. RrCPCNT is coded as 1 if the respondent reports that they did have weekly in-person or electronic contact with their parents. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCPCNT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCPCNTFX indicates how often the respondent's spouse had in-person contact with their non-co-residing parents during the COVID-19 pandemic. SrCFPCNTFX is a flag variable that indicates whether responses to SrCPCNTFX are imputed by SHARE. SrCPCNTF indicates whether the respondent's spouse had any frequent (i.e., at least weekly) in-person contact with their non-co-residing parents during the COVID-19 pandemic. SrCPCNTPMX indicates how often the respondent's spouse had contact with their non-co-residing parents by phone, email, or other electronic means during the COVID-19 pandemic. SrCFPCNTPMX is a flag variable that indicates whether responses to SrCPCNTPMX are imputed by SHARE. SrCPCNTPM indicates whether the respondent's spouse has any frequent (i.e., at least weekly) contact with their non-co-residing parents by phone, email, or other electronic means during the COVID-19 pandemic. SrCPCNTX indicates how often the respondent's spouse had contact of any kind (in-person, by phone, email, or other electronic means) with their non-co-residing parents during the COVID-19 pandemic. SrCFPCNTX is a flag variable that indicates whether responses to SrCPCNTX are imputed by SHARE. SrCPCNT indicates whether the respondent's spouse had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with their non-co-residing parents during the COVID-19 pandemic. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked how often they had personal contact (face to face) with their non-co-residing parents since the outbreak of COVID-19. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing parents since the outbreak of COVID-19.

At Round 2, respondents are asked how often they had personal contact with their non-co-residing parents during the last three months. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing parents during the last three months.

Differences with the Harmonized HRS COVID

In Round 1 of the HRS COVID, questions about contact with the respondent's relatives are asked in the self-completion questionnaire. These questions are not asked in Round 2 of the HRS COVID. Additionally, the Harmonized HRS COVID cannot distinguish parents from other relatives and groups non-child relatives (parents, siblings, grandchildren, or cousins) and friends into a singular category. Thus, harmonized variables in the Harmonized HRS COVID in this section refer to non-co-residing relatives and friends.

At Rounds 1 and 2 of the HRS COVID, respondents are asked to report how the amount of electronic contact with other non-co-residing family members (not including children or grandchildren) changed during the pandemic compared to before the pandemic; at Round 2, these non-co-residing family members also include parents and in-laws. At Round 2 only, the HRS COVID also asks respondents to report how the amount of in-person contact with other non-co-residing family members (not including children or grandchildren) changed during the pandemic compared to before the pandemic. These other non-co-residing family members also include parents and in-laws. These questions are not asked in the SHARE Corona survey.

The HRS COVID does not provide imputed values as part of its public release.

Comparability with the Gateway Harmonized SHARE

RrCPCNTX: This variable is related to RwPCNTF, which indicates the frequency with which the respondent has contact with any of their parents in person, by phone, mail, e-mail, sms or mms, in the Gateway Harmonized SHARE. Please note that a slightly different scale is used to indicate the frequency. The Gateway Harmonized SHARE also includes RwPCNT, which indicates whether the respondent has any frequent contact with any of their parents in person, by phone, mail, e-mail, sms or mms.

### How Constructed:

At Round 1, respondents are asked how often they had personal contact (face to face) with their non-co-residing relatives (not including children and parents) since the outbreak of COVID-19. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing relatives since the outbreak of COVID-19. At Round 2, respondents are asked how often they had personal contact with their non-co-residing relatives (not including children, grandchildren, and parents) during the last three months. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing relatives during the last three months. At Rounds 1 and 2, respondents can report that they had in-person or electronic contact with their non-co-residing relatives "daily", "several times a week", "about once a week", "less often", or "never".

RrCRCNTFX indicates how often the respondent had in-person contact with their non-co-residing relatives, not including children or parents, during the COVID-19 pandemic. For Round 2 only, non-co-residing relatives also explicitly include grandchildren. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRCNTFX is coded as 1 if the respondent reports that they had in-person contact with their relatives daily. RrCRCNTFX is coded as 2 if the respondent reports that they had in-person contact with their relatives several times a week. RrCRCNTFX is coded as 3 if the respondent reports that they had in-person contact with their relatives about once a week. RrCRCNTFX is coded as 4 if the respondent reports that they had in-person contact with their relatives less often. RrCRCNTFX is coded as 5 if the respondent reports that they never had in-person contact with their relatives. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCNTFX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFRCNTFX is a flag variable that indicates whether responses to RrCRCNTFX are imputed by SHARE. RrCFRCNTFX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFRCNTFX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRCNTF indicates whether the respondent has had any frequent (i.e., at least weekly) in-person contact with their non-co-residing relatives, not including children or parents, during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting their relatives daily, several times a week, or about once a week. For Round 2 only, non-co-residing relatives also explicitly include grandchildren. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRCNTF is coded as 0 if the respondent reports that they did not have weekly in-person contact with their relatives. RrCRCNTF is coded as 1 if the respondent reports that they did have weekly in-person contact with their relatives. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCNTF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRCNTPMX indicates how often the respondent had contact with their non-co-residing relatives, not including children or parents, by phone, email, or other electronic means during the COVID-19 pandemic. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRCNTPMX is coded as 1 if the respondent reports that they had electronic contact with their relatives daily. RrCRCNTPMX is coded as 2 if the respondent reports that they had electronic contact with their relatives several times a week. RrCRCNTPMX is coded as 3 if the respondent reports that they had electronic contact with their relatives about once a week. RrCRCNTPMX is coded as 4 if the respondent reports that they had electronic contact with their relatives less often. RrCRCNTPMX is coded as 5 if the respondent reports that they never had electronic contact with their relatives. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCNTPMX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFRCNTPMX is a flag variable that indicates whether responses to RrCRCNTPMX are imputed by SHARE. RrCFRCNTPMX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFRCNTPMX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRCNTPM indicates whether the respondent has had any frequent (i.e., at least weekly) contact with their non-co-residing relatives, not including children or parents, by phone, email, or other electronic means during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting their relatives daily, several times a week, or about once a week. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRCNTPM is coded as 0 if the respondent reports that they did not have weekly electronic contact with their relatives. RrCRCNTPM is coded as 1 if the respondent reports that they did have weekly electronic contact with their relatives. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCNTPM is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRCNTX indicates how often the respondent had contact of any kind (in-person, by phone, email, or other electronic means) with their non-co-residing relatives, not including children or parents, during the COVID-19 pandemic. For Round 2 only, non-co-residing relatives also explicitly include grandchildren for in-person contact. RrCRCNTX summarizes the information found in RrCRCNTFX and RrCRCNTPMX. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRCNTX is coded as 1 if the respondent reports that they had in-person or electronic contact with their relatives daily. RrCRCNTX is coded as 2 if the respondent reports that they had in-person or electronic contact with their relatives several times a week. RrCRCNTX is coded as 3 if the respondent reports that they had in-person or electronic contact with their relatives about once a week. RrCRCNTX is coded as 4 if the respondent reports that they had in-person or electronic contact with their relatives less often. RrCRCNTX is coded as 5 if the respondent reports that they never had in-person or electronic contact with their relatives. RrCRCNTX prioritizes the assignment of values from most frequent to least frequent contact. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFRCNTX is a flag variable that indicates whether responses to RrCRCNTX are imputed by SHARE. RrCFRCNTX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFRCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRCNT indicates whether the respondent has had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with their non-co-residing relatives, not including children or parents, during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting their relatives daily, several times a week, or about once a week. RrCRCNT summarizes the information found in RrCRCNTF and RrCRCNTPM. For Round 2 only, non-co-residing relatives also explicitly include grandchildren for in-person contact. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRCNT is coded as 0 if the respondent reports that they did not have weekly in-person or electronic contact with their relatives. RrCRCNT is coded as 1 if the respondent reports that they did have weekly in-person or electronic contact with their relatives. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRCNT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

For the following spouse variables, at Round 2 only, non-co-residing relatives also include grandchildren for in-person contact. SrCRCNTFX indicates how often the respondent's spouse had in-person contact with their non-co-residing relatives, not including children or parents, during the COVID-19 pandemic. SrCFRCNTFX is a flag variable that indicates whether responses to SrCRCNTFX are imputed by SHARE. SrCRCNTF indicates whether the respondent's spouse had any frequent (i.e., at least weekly) in-person contact with their non-co-residing relatives, not including children or parents, during the COVID-19 pandemic. SrCRCNTPMX indicates how often the respondent's spouse had contact with their non-co-residing relatives, not including children or parents, by phone, email, or other electronic means during the COVID-19 pandemic. SrCFRCNTPMX is a flag variable that indicates whether responses to SrCRCNTPMX are imputed by SHARE. SrCRCNTPM indicates whether the respondent's spouse has any frequent (i.e., at least weekly) contact with their non-co-residing relatives, not including children or parents, by phone, email, or other electronic means during the COVID-19 pandemic. SrCRCNTX indicates how often the respondent's spouse had contact of any kind (in-person, by phone, email, or other electronic means) with their non-co-residing relatives, not including children or parents, during the COVID-19 pandemic. SrCFRCNTX is a flag variable that indicates whether responses to SrCRCNTX are imputed by SHARE. SrCRCNT indicates whether the respondent's spouse had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with their non-co-residing relatives, not including children or parents, during the COVID-19 pandemic. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked how often they had personal contact (face to face) with their non-co-residing relatives (not including children or parents) since the outbreak of COVID-19. Respondents are

also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing relatives (not including children or parents) since the outbreak of COVID-19.

At Round 2, respondents are asked how often they had personal contact with their non-co-residing relatives (not including children or parents) and separately with their grandchildren during the last three months. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing relatives (not including children or parents; no separate grandchildren category) during the last three months.

Please note that in Round 2, RrCRCNTFX, RrCRCNTF, RrCRCNTX, and RrCRCNT categorize grandchildren under non-co-residing relatives, while grandchildren are presumably included in this category in Round 1.

### **Differences with the Harmonized HRS COVID**

In Round 1 of the HRS COVID, questions about contact with the respondent's relatives are asked in the self-completion questionnaire. These questions are not asked in Round 2 of the HRS COVID. Additionally, the Harmonized HRS COVID groups non-child relatives (parents, siblings, grandchildren, or cousins) and friends into a singular category and does not distinguish relatives separately. Thus, harmonized variables in the Harmonized HRS COVID in this section refer to non-co-residing relatives and friends.

At Rounds 1 and 2, respondents are asked to report how the amount of electronic contact with other non-co-residing family members (not including children or grandchildren) changed during the pandemic compared to before the pandemic. At Round 2 only, the HRS COVID also asks respondents to report how the amount of in-person contact with other non-co-residing family members (not including children or grandchildren) changed during the pandemic compared to before the pandemic. These questions are not asked in the SHARE Corona survey.

The HRS COVID does not provide imputed values as part of its public release.

### **Comparability with the Gateway Harmonized SHARE**

No comparable variables are available in the Gateway Harmonized SHARE.

### **SHARE Variables Used:**

#### **Round 1 Covid-19:**

|          |                                                         |
|----------|---------------------------------------------------------|
| FECNT3   | Social: freq. electr. contacts other relatives since ou |
| FECNT3_F | Social: freq. electr. contacts other relatives since ou |
| FPCNT3   | Social: freq. pers. contacts other relatives since outb |
| FPCNT3_F | Social: freq. pers. contacts other relatives since outb |

#### **Round 2 Covid-19:**

|          |                                                         |
|----------|---------------------------------------------------------|
| CAS103_3 | Social: contact frequency with other relatives during 1 |
| CAS103_5 | Social: contact frequency with own grandchildren during |
| CAS104_3 | Social: electronic contact frequency with other relativ |

|                                                                                         |
|-----------------------------------------------------------------------------------------|
| <b>Contact with Non-Relatives in Person, by Phone, Email, or Other Electronic Means</b> |

### How Constructed:

At Round 1, respondents are asked how often they had personal contact (face to face) with non-co-residing non-relatives like neighbors, friends, and colleagues since the outbreak of COVID-19. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with non-co-residing non-relatives since the outbreak of COVID-19. At Round 2, respondents are asked how often they had personal contact with non-co-residing non-relatives like neighbors, friends, and colleagues during the last three months. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with non-co-residing non-relatives during the last three months. At Rounds 1 and 2, respondents can report that they had in-person or electronic contact with non-co-residing non-relatives "daily", "several times a week", "about once a week", "less often", or "never".

RrCNRCNTFX indicates how often the respondent had in-person contact with non-co-residing non-relatives - like neighbors, friends, or colleagues - during the COVID-19 pandemic. At Round 1, the timeframe

references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCNRcntfx is coded as 1 if the respondent reports that they had in-person contact with non-relatives daily. RrCNRcntfx is coded as 2 if the respondent reports that they had in-person contact with non-relatives several times a week. RrCNRcntfx is coded as 3 if the respondent reports that they had in-person contact with non-relatives about once a week. RrCNRcntfx is coded as 4 if the respondent reports that they had in-person contact with non-relatives less often. RrCNRcntfx is coded as 5 if the respondent reports that they never had in-person contact with non-relatives. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCNRcntfx is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFnrCntfx is a flag variable that indicates whether responses to RrCNRcntfx are imputed by SHARE. RrCFnrCntfx is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFnrCntfx is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCNRcntf indicates whether the respondent has had any frequent (i.e., at least weekly) in-person contact with non-co-residing non-relatives - like neighbors, friends, or colleagues - during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting non-relatives daily, several times a week, or about once a week. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCNRcntf is coded as 0 if the respondent reports that they did not have weekly in-person contact with non-relatives. RrCNRcntf is coded as 1 if the respondent reports that they did have weekly in-person contact with non-relatives. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCNRcntf is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCNRcntpmx indicates how often the respondent had contact with non-co-residing non-relatives - like neighbors, friends, or colleagues - by phone, email, or other electronic means during the COVID-19 pandemic. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCNRcntpmx is coded as 1 if the respondent reports that they had electronic contact with non-relatives daily. RrCNRcntpmx is coded as 2 if the respondent reports that they had electronic contact with non-relatives several times a week. RrCNRcntpmx is coded as 3 if the respondent reports that they had electronic contact with non-relatives about once a week. RrCNRcntpmx is coded as 4 if the respondent reports that they had electronic contact with non-relatives less often. RrCNRcntpmx is coded as 5 if the respondent reports that they never had electronic contact with non-relatives. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCNRcntpmx is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFnrCntpmx is a flag variable that indicates whether responses to RrCNRcntpmx are imputed by SHARE. RrCFnrCntpmx is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFnrCntpmx is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCNRcntpm indicates whether the respondent has had any frequent (i.e., at least weekly) contact with non-co-residing non-relatives - like neighbors, friends, or colleagues - by phone, email, or other electronic means during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting non-relatives daily, several times a week, or about once a week. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCNRcntpm is coded as 0 if the respondent reports that they did not have weekly electronic contact with non-relatives. RrCNRcntpm is coded as 1 if the respondent reports that they did have weekly electronic contact with non-relatives. Special missing value (.n) is assigned if the respondent indicated that this type of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCNRcntpm is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCNRcntx indicates how often the respondent had contact of any kind (in-person, by phone, email, or other electronic means) with non-co-residing non-relatives - like neighbors, friends, or colleagues - during the COVID-19 pandemic. At Round 1, the timeframe references "since the outbreak of Corona" and at

Round 2, the timeframe refers to the "last three months". RrCNRCNTX summarizes the information found in RrCNRCNTFX and RrCNRCNTPMX. RrCNRCNTX is coded as 1 if the respondent reports that they had in-person or electronic contact with non-relatives daily. RrCNRCNTX is coded as 2 if the respondent reports that they had in-person or electronic contact with non-relatives several times a week. RrCNRCNTX is coded as 3 if the respondent reports that they had in-person or electronic contact with non-relatives about once a week. RrCNRCNTX is coded as 4 if the respondent reports that they had in-person or electronic contact with non-relatives less often. RrCNRCNTX is coded as 5 if the respondent reports that they never had in-person or electronic contact with non-relatives. RrCNRCNTX prioritizes the assignment of values from most frequent to least frequent contact. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCNRCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFNRCNTX is a flag variable that indicates whether responses to RrCNRCNTX are imputed by SHARE. RrCFNRCNTX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFNRCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCNRCNT indicates whether the respondent has had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with non-co-residing non-relatives - like neighbors, friends, or colleagues - during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting non-relatives daily, several times a week, or about once a week. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCNRCNT summarizes the information found in RrCNRCNTF and RrCNRCNTPM. RrCNRCNT is coded as 0 if the respondent reports that they did not have weekly in-person or electronic contact with non-relatives. RrCNRCNT is coded as 1 if the respondent reports that they did have weekly in-person or electronic contact with non-relatives. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCNRCNT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCNRCNTFX indicates how often the respondent's spouse had in-person contact with non-co-residing non-relatives - like neighbors, friends, or colleagues - during the COVID-19 pandemic. SrCFNRCNTFX is a flag variable that indicates whether responses to SrCNRCNTFX are imputed by SHARE. SrCNRCNTF indicates whether the respondent's spouse had any frequent (i.e., at least weekly) in-person contact with non-co-residing non-relatives - like neighbors, friends, or colleagues - during the COVID-19 pandemic. SrCNRCNTPMX indicates how often the respondent's spouse had contact with non-co-residing non-relatives - like neighbors, friends, or colleagues - by phone, email, or other electronic means during the COVID-19 pandemic. SrCFNRCNTPMX is a flag variable that indicates whether responses to SrCNRCNTPMX are imputed by SHARE. SrCNRCNTPM indicates whether the respondent's spouse has any frequent (i.e., at least weekly) contact with non-co-residing non-relatives - like neighbors, friends, or colleagues - by phone, email, or other electronic means during the COVID-19 pandemic. SrCNRCNTX indicates how often the respondent's spouse had contact of any kind (in-person, by phone, email, or other electronic means) with non-co-residing non-relatives - like neighbors, friends, or colleagues - during the COVID-19 pandemic. SrCFNRCNTX is a flag variable that indicates whether responses to SrCNRCNTX are imputed by SHARE. SrCNRCNT indicates whether the respondent's spouse had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with non-co-residing non-relatives - like neighbors, friends, or colleagues - during the COVID-19 pandemic. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked how often they had personal contact (face to face) with non-co-residing non-relatives like neighbors, friends, and colleagues since the outbreak of COVID-19. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with non-co-residing non-relatives since the outbreak of COVID-19.

At Round 2, respondents are asked how often they had personal contact with non-co-residing non-relatives like neighbors, friends, and colleagues during the last three months. Respondents are also asked to

report how often they had contact by phone, email, or any other electronic means with non-co-residing non-relatives during the last three months.

Differences with the Harmonized HRS COVID

In Round 1 of the HRS COVID, questions about contact with the respondent's friends are asked in the self-completion questionnaire. These questions are not asked in Round 2 of the HRS COVID. Additionally, the Harmonized HRS COVID groups non-child relatives (parents, siblings, grandchildren, or cousins) and friends into a singular category and does not distinguish non-relatives separately. Thus, harmonized variables in the Harmonized HRS COVID in this section refer to non-co-residing relatives and friends. The SHARE Corona survey specifies neighbors, friends, or colleagues as examples of other non-relatives.

At Rounds 1 and 2 of the HRS COVID, respondents are asked to report how the amount of electronic contact with other non-co-residing family members (not including children or grandchildren) changed during the pandemic compared to before the pandemic. At Round 2 only, the HRS COVID also asks respondents to report how the amount of in-person contact with other non-co-residing family members (not including children or grandchildren) changed during the pandemic compared to before the pandemic. These questions are not asked in the SHARE Corona survey.

The HRS COVID does not provide imputed values as part of its public release.

Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### How Constructed:

At Round 1, respondents are asked how often they had personal contact (face to face) with their non-co-residing relatives or non-relatives since the outbreak of COVID-19. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing relatives or non-relatives since the outbreak of COVID-19. Non-co-residing relatives include parents and other relatives, but not children. Non-co-residing non-relatives include neighbors, friends, and colleagues. At Round 2, respondents are asked how often they had personal contact with their non-co-residing relatives or non-relatives during the last three months. For this question only, non-co-residing relatives include parents, grandchildren, and other relatives, but not children. Non-co-residing non-relatives include neighbors, friends, or colleagues. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing relatives (parents and other relatives, but not children) or non-relatives (neighbors, friends, and colleagues) during the last three months. At Rounds 1 and 2, respondents can report that they had in-person or electronic

contact with their non-co-residing relatives or non-relatives "daily", "several times a week", "about once a week", "less often", or "never".

RrCRFCNTFX indicates how often the respondent had in-person contact with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) during the COVID-19 pandemic. RrCRFCNTFX summarizes the information found in RrCKCNTFX, RrCPCNTFX, RrCRCNTFX, and RrCFCNTFX. For Round 2 only, non-co-residing relatives also explicitly include grandchildren. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRFCNTFX is coded as 1 if the respondent reports that they had in-person contact with their relatives or non-relatives daily. RrCRFCNTFX is coded as 2 if the respondent reports that they had in-person contact with their relatives or non-relatives several times a week. RrCRFCNTFX is coded as 3 if the respondent reports that they had in-person contact with their relatives or non-relatives about once a week. RrCRFCNTFX is coded as 4 if the respondent reports that they had in-person contact with their relatives or non-relatives less often. RrCRFCNTFX is coded as 5 if the respondent reports that they never had in-person contact with their relatives or non-relatives. RrCRFCNTFX prioritizes the assignment of values from most frequent to least frequent contact. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRFCNTFX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFRFCNTFX is a flag variable that indicates whether responses to RrCRFCNTFX are imputed by SHARE. RrCFRFCNTFX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFRFCNTFX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRFCNTF indicates whether the respondent has had any frequent (i.e., at least weekly) in-person contact with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) during the COVID-19 pandemic. RrCRFCNTFX summarizes the information found in RrCKCNTF, RrCPCNTF, RrCRCNTF, and RrCFCNTF. For Round 2 only, non-co-residing relatives also include grandchildren. Weekly contact is defined as the respondent contacting their relatives or non-relatives daily, several times a week, or about once a week. For Round 2 only, non-co-residing relatives also include grandchildren. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRFCNTF is coded as 0 if the respondent reports that they did not have weekly in-person contact with their relatives or non-relatives. RrCRFCNTF is coded as 1 if the respondent reports that they did have weekly in-person contact with their relatives or non-relatives. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRFCNTF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRFCNTPMX indicates how often the respondent had contact with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) by phone, email, or other electronic means during the COVID-19 pandemic. RrCRFCNTPMX summarizes the information found in RrCKCNTPMX, RrCPCNTPMX, RrCRCNTPMX, and RrCFCNTPMX. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRFCNTPMX is coded as 1 if the respondent reports that they had electronic contact with their relatives or non-relatives daily. RrCRFCNTPMX is coded as 2 if the respondent reports that they had electronic contact with their relatives or non-relatives several times a week. RrCRFCNTPMX is coded as 3 if the respondent reports that they had electronic contact with their relatives or non-relatives about once a week. RrCRFCNTPMX is coded as 4 if the respondent reports that they had electronic contact with their relatives or non-relatives less often. RrCRFCNTPMX is coded as 5 if the respondent reports that they never had electronic contact with their relatives or non-relatives. RrCRFCNTPMX prioritizes the assignment of values from most frequent to least frequent contact. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRFCNTPMX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFRFCNTPMX is a flag variable that indicates whether responses to RrCRFCNTPMX are imputed by SHARE. RrCFRFCNTPMX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFRFCNTPMX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRFCNTPM indicates whether the respondent has had any frequent (i.e., at least weekly) contact with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) by phone, email, or other electronic means during the COVID-19 pandemic. RrCRFCNTPM summarizes the information found in RrCKCNTPM, RrPCNTPM, RrRCNTPM, and RrFCNTPM. Weekly contact is defined as the respondent contacting their relatives or non-relatives daily, several times a week, or about once a week. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRFCNTPM is coded as 0 if the respondent reports that they did not have weekly electronic contact with their relatives or non-relatives. RrCRFCNTPM is coded as 1 if the respondent reports that they did have weekly electronic contact with their relatives or non-relatives. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRFCNTPM is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRFCNTX indicates how often the respondent had contact of any kind (in-person, by phone, email, or other electronic means) with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) during the COVID-19 pandemic. RrCRFCNTX summarizes the information found in RrCRFCNTFX and RrCRFCNTPMX. For Round 2 only, non-co-residing relatives also include grandchildren for in-person contact. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRFCNTX is coded as 1 if the respondent reports that they had in-person or electronic contact with their relatives or non-relatives daily. RrCRFCNTX is coded as 2 if the respondent reports that they had in-person or electronic contact with their relatives or non-relatives several times a week. RrCRFCNTX is coded as 3 if the respondent reports that they had in-person or electronic contact with their relatives or non-relatives about once a week. RrCRFCNTX is coded as 4 if the respondent reports that they had in-person or electronic contact with their relatives or non-relatives less often. RrCRFCNTX is coded as 5 if the respondent reports that they never had in-person or electronic contact with their relatives or non-relatives. RrCRFCNTX prioritizes the assignment of values from most frequent to least frequent contact. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRFCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRFCNTX is a flag variable that indicates whether responses to RrCRFCNTX are imputed by SHARE. RrCRFCNTX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCRFCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRFCNT indicates whether the respondent has had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting their relatives or non-relatives daily, several times a week, or about once a week. RrCRFCNT summarizes the information found in RrCRFCNTF and RrCRFCNTPM. For Round 2 only, non-co-residing relatives also include grandchildren. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCRFCNT is coded as 0 if the respondent reports that they did not have weekly in-person or electronic contact with their relatives or non-relatives. RrCRFCNT is coded as 1 if the respondent reports that they did have weekly in-person or electronic contact with their relatives or non-relatives. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRFCNT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

For the following spouse variables, at Round 2 only, non-co-residing relatives also include grandchildren for in-person contact. SrCRFCNTFX indicates how often the respondent's spouse had in-person contact with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) during the COVID-19 pandemic. SrCRFCNTFX is a flag variable that indicates whether responses to SrCRFCNTFX are imputed by SHARE. SrCRFCNTF indicates whether the respondent's spouse had any frequent (i.e., at least weekly) in-person contact with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) during the COVID-19 pandemic. SrCRFCNTPMX indicates how often the respondent's spouse had contact with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) by phone, email, or other electronic means during the COVID-19 pandemic. SrCRFCNTPMX is a flag variable that indicates whether

responses to SrCRFCNTPMX are imputed by SHARE. SrCRFCNTPM indicates whether the respondent's spouse has any frequent (i.e., at least weekly) contact with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) by phone, email, or other electronic means during the COVID-19 pandemic. SrCRFCNTX indicates how often the respondent's spouse had contact of any kind (in-person, by phone, email, or other electronic means) with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) during the COVID-19 pandemic. SrCRFCNTX is a flag variable that indicates whether responses to SrCRFCNTX are imputed by SHARE. SrCRFCNT indicates whether the respondent's spouse had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with their non-co-residing relatives (parents or other relatives) or non-relatives (neighbors, friends, or colleagues) during the COVID-19 pandemic. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked how often they had personal contact (face to face) with their non-co-residing relatives or non-relatives since the outbreak of COVID-19. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing relatives or non-relatives since the outbreak of COVID-19. Non-co-residing relatives include parents and other relatives, but not children. Non-co-residing non-relatives include neighbors, friends, and colleagues in a single category.

At Round 2, respondents are asked how often they had personal contact with their non-co-residing relatives or non-relatives during the last three months. For this question only, non-co-residing relatives include parents, grandchildren, and other relatives, but not children. Non-co-residing non-relatives include neighbors, friends, or colleagues. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with their non-co-residing relatives (parents and other relatives, but not children) or non-relatives (neighbors, friends, and colleagues in a single category) during the last three months.

## Differences with the Harmonized HRS COVID

In Round 1 of the HRS COVID, questions about contact with the respondent's relatives and friends are asked in the self-completion questionnaire. These questions are not asked in Round 2 of the HRS COVID. The harmonized variables in this section of Harmonized HRS COVID refer to non-co-residing relatives and friends. The SHARE Corona survey specifies neighbors, friends, or colleagues as examples of other non-relatives. Thus, these variables in the Gateway Harmonized SHARE COVID refer to relatives (parents or other relatives) and non-relatives (neighbors, friends, or colleagues).

At Rounds 1 and 2 of the HRS COVID, respondents are asked to report how the amount of electronic contact with other non-co-residing family members (not including children or grandchildren) changed during the pandemic compared to before the pandemic. At Round 2 only, the HRS COVID also asks respondents to report how the amount of in-person contact with other non-co-residing family members (not including children or grandchildren) changed during the pandemic compared to before the pandemic. These questions are not asked in the SHARE Corona survey.

The HRS COVID does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

### How Constructed:

At Round 1, respondents are asked how often they had personal contact (face to face) with anyone outside their household since the outbreak of COVID-19. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with anyone outside their household since the outbreak of COVID-19. Categories for both questions include their own children, own parents, other relatives, and other non-relatives like neighbors, friends, or colleagues. At Round 2, respondents are asked how often they had personal contact with anyone outside their household during the last three months. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with anyone outside their household during the last three months. Categories for both questions include their own children, own parents, other relatives, and other non-relatives like neighbors, friends, or colleagues, and there is an additional category for in-person contact with grandchildren. At Rounds 1 and 2, respondents can report that they had in-person or electronic contact

with anyone outside their household "daily", "several times a week", "about once a week", "less often", or "never".

RrCCNTFX indicates how often the respondent had in-person contact with anyone outside their household during the COVID-19 pandemic. RrCCNTFX summarizes the information found in RrCKCNTFX, RrPCNTFX, RrRCNTFX, and RrFCNTFX. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCCNTFX is coded as 1 if the respondent reports that they had in-person contact with anyone outside their household daily. RrCCNTFX is coded as 2 if the respondent reports that they had in-person contact with anyone outside their household several times a week. RrCCNTFX is coded as 3 if the respondent reports that they had in-person contact with anyone outside their household about once a week. RrCCNTFX is coded as 4 if the respondent reports that they had in-person contact with anyone outside their household less often. RrCCNTFX is coded as 5 if the respondent reports that they never had in-person contact with anyone outside their household. RrCCNTFX prioritizes the assignment of values from most frequent to least frequent contact. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCCNTFX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrFCNTFX is a flag variable that indicates whether responses to RrCCNTFX are imputed by SHARE. RrFCNTFX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrFCNTFX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCCNTF indicates whether the respondent has had any frequent (i.e., at least weekly) in-person contact with anyone outside their household during the COVID-19 pandemic. RrCCNTF summarizes the information found in RrCKCNTF, RrPCNTF, RrRCNTF, and RrFCNTF. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". Weekly contact is defined as the respondent contacting anyone outside their household daily, several times a week, or about once a week. RrCCNTF is coded as 0 if the respondent reports that they did not have weekly in-person contact with anyone outside their household. RrCCNTF is coded as 1 if the respondent reports that they did have weekly in-person contact with anyone outside their household. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCCNTF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCCNTPMX indicates how often the respondent had contact with anyone outside their household by phone, email, or other electronic means during the COVID-19 pandemic. RrCCNTPMX summarizes the information found in RrCKCNTPMX, RrPCNTPMX, RrRCNTPMX, and RrFCNTPMX. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCCNTPMX is coded as 1 if the respondent reports that they had electronic contact with anyone outside their household daily. RrCCNTPMX is coded as 2 if the respondent reports that they had electronic contact with anyone outside their household several times a week. RrCCNTPMX is coded as 3 if the respondent reports that they had electronic contact with anyone outside their household about once a week. RrCCNTPMX is coded as 4 if the respondent reports that they had electronic contact with anyone outside their household less often. RrCCNTPMX is coded as 5 if the respondent reports that they never had electronic contact with anyone outside their household. RrCCNTPMX prioritizes the assignment of values from most frequent to least frequent contact. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCCNTPMX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrFCNTPMX is a flag variable that indicates whether responses to RrCCNTPMX are imputed by SHARE. RrFCNTPMX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrFCNTPMX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCCNTPM indicates whether the respondent has had any frequent (i.e., at least weekly) contact with anyone outside their household by phone, email, or other electronic means during the COVID-19 pandemic. RrCCNTPM summarizes the information found in RrCKCNTPM, RrPCNTPM, RrRCNTPM, and RrFCNTPM. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". Weekly contact is defined as the respondent contacting anyone outside their household

daily, several times a week, or about once a week. RrCCNTPM is coded as 0 if the respondent reports that they did not have weekly electronic contact with anyone outside their household. RrCCNTPM is coded as 1 if the respondent reports that they did have weekly electronic contact with anyone outside their household. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCCNTPM is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCCNTX indicates how often the respondent had contact of any kind (in-person, by phone, email, or other electronic means) with anyone outside their household during the COVID-19 pandemic. RrCCNTX summarizes the information found in RrCCNTFX and RrCCNTPMX. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCCNTX is coded as 1 if the respondent reports that they had in-person or electronic contact with anyone outside their household daily. RrCCNTX is coded as 2 if the respondent reports that they had in-person or electronic contact with anyone outside their household several times a week. RrCCNTX is coded as 3 if the respondent reports that they had in-person or electronic contact with anyone outside their household about once a week. RrCCNTX is coded as 4 if the respondent reports that they had in-person or electronic contact with anyone outside their household less often. RrCCNTX is coded as 5 if the respondent reports that they never had in-person or electronic contact with anyone outside their household. RrCCNTX prioritizes the assignment of values from most frequent to least frequent contact. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFCNTX is a flag variable that indicates whether responses to RrCCNTX are imputed by SHARE. RrCFCNTX is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFCNTX is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCCNT indicates whether the respondent has had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with anyone outside their household during the COVID-19 pandemic. Weekly contact is defined as the respondent contacting anyone outside their household daily, several times a week, or about once a week. RrCCNT summarizes the information found in RrCCNTF and RrCCNTPM. At Round 1, the timeframe references "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCCNT is coded as 0 if the respondent reports that they did not have weekly in-person or electronic contact with anyone outside their household. RrCCNT is coded as 1 if the respondent reports that they did have weekly in-person or electronic contact with anyone outside their household. Special missing value (.n) is assigned if the respondent indicated that these types of contact did not apply to them. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCCNT is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCCNTFX indicates how often the respondent's spouse had in-person contact with anyone outside their household during the COVID-19 pandemic. SrCFCNTFX is a flag variable that indicates whether responses to SrCCNTFX are imputed by SHARE. SrCCNTF indicates whether the respondent's spouse had any frequent (i.e., at least weekly) in-person contact with anyone outside their household during the COVID-19 pandemic. SrCCNTPMX indicates how often the respondent's spouse had contact with anyone outside their household by phone, email, or other electronic means during the COVID-19 pandemic. SrCFCNTPMX is a flag variable that indicates whether responses to SrCCNTPMX are imputed by SHARE. SrCCNTPM indicates whether the respondent's spouse has any frequent (i.e., at least weekly) contact with anyone outside their household by phone, email, or other electronic means during the COVID-19 pandemic. SrCCNTX indicates how often the respondent's spouse had contact of any kind (in-person, by phone, email, or other electronic means) with anyone outside their household during the COVID-19 pandemic. SrCFCNTX is a flag variable that indicates whether responses to SrCCNTX are imputed by SHARE. SrCCNT indicates whether the respondent's spouse had any frequent (i.e., at least weekly) contact of any kind (in person, by phone, email, or other electronic means) with anyone outside their household during the COVID-19 pandemic. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are asked how often they had personal contact (face to face) with anyone outside their household since the outbreak of COVID-19. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with anyone outside their household since the outbreak of COVID-19. At Round 2, respondents are asked how often they had personal contact with anyone outside their household during the last three months. Respondents are also asked to report how often they had contact by phone, email, or any other electronic means with anyone outside their household during the last three months.

## Differences with the Harmonized HRS COVID

These questions are asked in the self-completion questionnaire in Round 1 of the HRS COVID. These questions are not asked in Round 2 of the HRS COVID. Weekly contact in the Harmonized HRS COVID is defined as the respondent contacting anyone outside their household three or more times a week, or once or twice a week. The Gateway Harmonized SHARE COVID uses a slightly different definition: weekly contact is defined as the respondent contacting anyone outside their home daily, several times a week, or about once a week. Anyone outside of their household in the Harmonized HRS COVID includes non-co-residing children, relatives, or friends. In the Gateway Harmonized SHARE COVID, it includes children, grandchildren (Round 2 only), parents, other relatives, neighbors, friends, or colleagues.

The Gateway Harmonized SHARE COVID provides both categorical and binary variables to indicate the frequency of contact and whether respondents contact anyone outside their home through face to face contact, phone, email, or other electronic means. The Harmonized HRS COVID provides only binary variables to indicate whether respondents contact anyone outside their household in person, by phone, mail, email, or social media, or in any way.

The HRS COVID does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

## SHARE Variables Used:

### Round 1 Covid-19:

|           |                                                         |
|-----------|---------------------------------------------------------|
| FECONT1   | Social: freq. electr. contacts own children since outbr |
| FECONT1_F | Social: freq. electr. contacts own children since outbr |
| FECONT2   | Social: freq. electr. contacts own parents since outbre |
| FECONT2_F | Social: freq. electr. contacts own parents since outbre |
| FECONT3   | Social: freq. electr. contacts other relatives since ou |
| FECONT3_F | Social: freq. electr. contacts other relatives since ou |
| FECONT4   | Social: freq. electr. contacts others since outbreak    |
| FECONT4_F | Social: freq. electr. contacts others since outbreak -  |
| FPCONT1   | Social: freq. pers. contacts own children since outbrea |
| FPCONT1_F | Social: freq. pers. contacts own children since outbrea |
| FPCONT2   | Social: freq. pers. contacts own parents since outbreak |
| FPCONT2_F | Social: freq. pers. contacts own parents since outbreak |
| FPCONT3   | Social: freq. pers. contacts other relatives since outb |

### How Constructed:

At Round 1, respondents are asked to report if they have ever left their home since the COVID-19 outbreak. If the respondent reports that they have left their home since the outbreak, they are then asked to report how often they have done different activities since the COVID-19 outbreak, as compared to before the outbreak. Respondents can report that they have done an activity "not any more", "less often", "about the same", or "more often" compared to before the COVID-19 outbreak. At Round 1, activities include going shopping, going out for a walk, meeting with more than 5 people from outside their household, and visiting other family members. At Round 2, respondents are asked to report if they have ever left their home during the last three months. If the respondent reports that they have left their home during the last three months, they are then asked to report how often they have done different activities during the last three months. However, these questions in Round 2 utilize a different response scale ("several times a week", "about once a week", "less than once a week", or "not at all") that is not comparable to the response scale used in Round 1. Because of this, Round 2 questions are included in the next sub-section of this codebook.

RrCACHSHP indicates how often the respondent has gone shopping compared to before the COVID-19 outbreak. RrCACHSHP is only available at Round 1. RrCACHSHP is coded as 0 if the respondent reports that they do not go shopping any more since the pandemic. RrCACHSHP is coded as 1 if the respondent reports that they have gone shopping less often compared to before the pandemic. RrCACHSHP is coded as 2 if the respondent reports that they have gone shopping about the same amount as before the pandemic. RrCACHSHP is coded as 3 if the respondent reports that they have gone shopping more often compared to before the pandemic. Special missing value (.l) is assigned if the respondent reports that they have never left their home since the COVID-19 outbreak. Special missing value (.n) is assigned if the respondent reports that this question "does not apply" to them. RrCACHSHP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCACHVFAM indicates how often the respondent has visited other family members compared to before the COVID-19 pandemic. RrCACHVFAM is only available at Round 1. RrCACHVFAM is coded as 0 if the respondent reports that they do not visit other family members any more since the pandemic. RrCACHVFAM is coded as 1 if the respondent reports that they have visited other family members less often compared to before the pandemic. RrCACHVFAM is coded as 2 if the respondent reports that they have visited other family members about the same amount as before the pandemic. RrCACHVFAM is coded as 3 if the respondent reports that they have visited other family members more often compared to before the pandemic. Special missing value

(.l) is assigned if the respondent reports that they have never left their home since the outbreak of COVID-19. Special missing value (.n) is assigned if the respondent reports that this question "does not apply" to them. RrCACHVFAM is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCACHWALK indicates how often the respondent has gone outside for a walk compared to before the COVID-19 outbreak. RrCACHWALK is only available at Round 1. RrCACHWALK is coded as 0 if the respondent reports that they do not go out for walks any more since the pandemic. RrCACHWALK is coded as 1 if the respondent reports that they have gone out for walks less often compared to before the pandemic. RrCACHWALK is coded as 2 if the respondent reports that they have gone out for walks about the same amount as before the pandemic. RrCACHWALK is coded as 3 if the respondent reports that they have gone out for walks more often compared to before the pandemic. Special missing value (.l) is assigned if the respondent reports they have never left their home since the COVID-19 outbreak. Special missing value (.n) is assigned if the respondent reports that this question "does not apply" to them. RrCACHWALK is coded as plain missing (.) if the respondent did not participate in the current COVID round.

At Round 1, respondents are asked to report if they have done any volunteering activity since the COVID-19 outbreak. If the respondent reports that they have done any volunteering activity since the COVID-19 outbreak, they are then asked to report if they volunteered "less often", "about the same", or "more often" compared to before the outbreak. At Round 2, respondents are asked to report if they have done any volunteering activity during the last three months. If the respondent reports that they have done any volunteering activity during the last three months, they are then asked to report if they volunteered "less often", "about the same", or "more often" compared to the first wave of the pandemic.

RrCACHVOL indicates how often the respondent has done any volunteering activity - not including helping others outside of their household with obtaining necessities or providing personal care - compared to previously. At Round 1, RrCACHVOL is coded as 0 if the respondent reports that they have not done any volunteering activity since the COVID-19 outbreak. RrCACHVOL is coded as 1 if the respondent reports that they have volunteered less often compared to before the pandemic. RrCACHVOL is coded as 2 if the respondent reports that they have volunteered about the same as before the pandemic. RrCACHVOL is coded as 3 if the respondent reports that they have volunteered more often compared to before the pandemic. At Round 2, RrCACHVOL is coded as 0 if the respondent reports that they have not done any volunteering activity during the last three months. RrCACHVOL is coded as 1 if the respondent reports that they have volunteered less often compared to the first wave of the pandemic. RrCACHVOL is coded as 2 if the respondent reports that they have volunteered about the same as the first wave of the pandemic. RrCACHVOL is coded as 3 if the respondent reports that they have volunteered more often compared to the first wave of the pandemic. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCACHVOL is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCVOL indicates whether the respondent did any volunteering activity - not including helping others outside the household with obtaining necessities or providing personal care - during the COVID-19 pandemic. At Round 1, the timeframe refers to "since the outbreak of Corona" and at Round 2, the timeframe refers to the "last three months". RrCVOL is coded as 0 if the respondent reports that they have not done any volunteering activity during the pandemic. RrCVOL is coded as 1 if the respondent reports that they have done any volunteering activity during the pandemic. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCVOL is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFACHSHP, RrCFACHVFAM, RrCFACHWALK, RrCFACHVOL, and RrCFVOL are flag variables that indicate whether responses to RrCACHSHP, RrCACHVFAM, RrCACHWALK, RrCACHVOL, and RrCVOL, respectively, are imputed by SHARE. These variables are only available at Round 1 and are assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFACHSHP, RrCFACHVFAM, RrCFACHWALK, RrCFACHVOL, and RrCFVOL are coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCACHSHP indicates how often the respondent's spouse has gone shopping compared to before the COVID-19 outbreak. SrCFACHSHP is a flag variable that indicates whether responses to SrCACHSHP are imputed by SHARE. SrCACHVFAM indicates how often the respondent's spouse has traveled to visit other family members compared to before the COVID-19 outbreak. SrCFACHVFAM is a flag variable that indicates whether responses to SrCACHVFAM are imputed by SHARE. SrCACHWALK indicates how often the respondent's spouse has gone outside for a walk compared to before the COVID-19 outbreak. SrCFACHWALK is a flag variable that indicates whether responses to SrCACHWALK are imputed by SHARE. SrCACHVOL indicates how often the respondent's spouse has done any volunteering activity - not including helping others outside of their

household with obtaining necessities or providing personal care - compared to previously. SrCFACHVOL is a flag variable that indicates whether responses to SrCACHVOL are imputed by SHARE. SrCVOL indicates whether the respondent's spouse did any volunteering activity - not including helping others outside of their household with obtaining necessities or providing person care - during the COVID-19 pandemic. SrCFVOL is a flag variable that indicates whether responses to SrCVOL are imputed by SHARE. The spouse variables are taken from the spouse's values to the respondent variables. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, if the respondent reports that they have left their home since the outbreak, they are then asked to report how often they have done different activities since the COVID-19 outbreak, as compared to before the outbreak. Respondents can report that they have done an activity "not any more", "less often", "about the same", or "more often" compared to before the COVID-19 outbreak. Activities include going shopping, going out for a walk, and visiting other family members. At Round 2, respondents are asked to report if they have ever left their home during the last three months. If the respondent reports that they have left their home during the last three months, they are then asked to report how often they have done different activities during the last three months. However, these questions in Round 2 utilize a different response scale ("several times a week", "about once a week", "less than once a week", or "not at all") that is not comparable to the response scale used in Round 1. Because of this, Round 2 questions are included in the next sub-section of this codebook.

At Round 1, respondents are asked to report if they have done any volunteering activity since the COVID-19 outbreak. If the respondent reports that they have done any volunteering activity since the COVID-19 outbreak, they are then asked to report if they volunteered "less often", "about the same", or "more often" compared to before the outbreak. At Round 2, respondents are asked to report if they have done any volunteering activity during the last three months. If the respondent reports that they have done any volunteering activity during the last three months, they are then asked to report if they volunteered "less often", "about the same", or "more often" compared to the first wave of the pandemic.

## Differences with the Harmonized HRS COVID

In the HRS COVID, questions about changes in activity during the pandemic are asked in the self-completion questionnaire. At Round 1, respondents are asked to report how often they did different activities since the beginning of the pandemic compared to before the pandemic, while Round 2 asks respondents to report how often they did different activities during the first year of the pandemic (from March 2020 to March 2021) compared to the months before March 2020. As a result, it is possible that the time periods referenced in these questions may overlap for some respondents. Additionally, the HRS COVID asks respondents how often they have walked outside their home for more than 20 minutes, but the SHARE Corona survey does not specify a minimum time requirement for walks. The HRS COVID also asks additional questions that are not asked in SHARE, such as how often the respondent has left their home, visited friends, attended religious services outside of their home, exercised at home, done hobbies, crafts, or puzzles, watched television, done garden work or home repairs, read books, magazines, or newspapers, and met with social groups via video conference compared to before the COVID-19 pandemic. Unlike the HRS COVID, the SHARE Corona survey codes these variables on a 4-point scale (0.not any more, 1.less often, 2.about the same, 3.more often) instead of a 3-point scale (1.less often, 2.about the same, 3.more often). The HRS COVID does not provide imputed values as part of its public release.

The Harmonized HRS COVID does not provide a binary variable to indicate whether respondents did any other volunteering activity since the outbreak of the pandemic.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

## SHARE Variables Used:

Round 1 Covid-19:

AVACT

Social: amount of volunteering since outbreak

|                   |                                                         |

### How Constructed:

At Round 2, respondents are asked to report if they have ever left their home during the last three months. If the respondent reports that they have left their home during the last three months, they are then asked to report how often they have done different activities during the last three months. Activities include going shopping; going to a post office, bank, or a public office; going to a restaurant or pub; and using public transportation. Respondents can report that they have done an activity "several times a week", "about once a week", "less than once a week", or "not at all" during the last three months. A question about shopping is included in Round 1 but utilizes a different response scale; please see the previous sub-section of this codebook for more information. The remaining questions are not asked in Round 1.

RrCSHPF indicates how often the respondent has gone shopping during the last three months. RrCSHPF is only available at Round 2. RrCSHPF is coded as 0 if the respondent reports that they have not gone shopping at all during the last three months. RrCSHPF is coded as 1 if the respondent reports that they have gone shopping less than once a week during the last three months. RrCSHPF is coded as 2 if the respondent reports that they have gone shopping about once a week during the last three months. RrCSHPF is coded as 3 if the respondent reports that they have gone shopping several times a week during the last three months. Special missing value (.l) is assigned if the respondent reports that they have never left their home during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCSHPF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCERRNDF indicates how often the respondent has gone to a post office, bank, or a public office during the last three months. RrCERRNDF is only available at Round 2. RrCERRNDF is coded as 0 if the respondent reports that they have not gone to a post office, bank, or a public office during the last three months. RrCERRNDF is coded as 1 if the respondent reports that they have gone to a post office, bank, or a public office less than once a week during the last three months. RrCERRNDF is coded as 2 if the respondent reports that they have gone to a post office, bank, or a public office about once a week during the last three months. RrCERRNDF is coded as 3 if the respondent reports that they have gone to a post office, bank, or a public office several times a week during the last three months. Special missing value (.l) is assigned if the respondent reports that they have never left their home during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCERRNDF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCRSTRNTF indicates how often the respondent has gone to a restaurant or pub during the last three months. RrCRSTRNTF is only available at Round 2. RrCRSTRNTF is coded as 0 if the respondent reports that they have not gone to a restaurant or pub during the last three months. RrCRSTRNTF is coded as 1 if the respondent reports that they have gone to a restaurant or pub less than once a week during the last three months. RrCRSTRNTF is coded as 2 if the respondent reports that they have gone to a restaurant or pub about once a week during the last three months. RrCRSTRNTF is coded as 3 if the respondent reports that they have gone to a restaurant or pub several times a week during the last three months. Special missing value (.l) is assigned if the respondent reports that they have never left their home during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCRSTRNTF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCPUBTRF indicates how often the respondent has used public transportation during the last three months. RrCPUBTRF is only available at Round 2. RrCPUBTRF is coded as 0 if the respondent reports that they have not used public transportation during the last three months. RrCPUBTRF is coded as 1 if the respondent reports that they have used public transportation less than once a week during the last three months. RrCPUBTRF is coded as 2 if the respondent reports that they have used public transportation about once a week during the last three months. RrCPUBTRF is coded as 3 if the respondent reports that they have used public transportation several times a week during the last three months. Special missing value (.l) is assigned if the respondent reports that they have never left their home during the last three months. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCPUBTRF is coded as plain missing (.) if the respondent did not participate in the current COVID round.

At Round 2, respondents are also asked to report whether they have traveled abroad for more than 48 hours since the COVID-19 outbreak. Respondents can report either "yes" or "no" to having traveled abroad for more than 48 hours since the COVID-19 outbreak. This question is not asked in Round 1.

RrCTRVABRD indicates whether the respondent has traveled abroad for more than 48 hours since the COVID-19 outbreak. RrCTRVABRD is only available at Round 2. RrCTRVABRD is coded as 0 if the respondent reports that they have not traveled abroad for more than 48 hours since the outbreak. RrCTRVABRD is coded as 1 if the respondent reports that they have traveled abroad for more than 48 hours since the outbreak. Don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCTRVABRD is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCSHPF indicates how often the respondent's spouse has gone shopping during the last three months. SrCERRNDF indicates how often the respondent's spouse has gone to a post office, bank, or a public office during the last three months. SrCRSTRNTE indicates how often the respondent's spouse has gone to a restaurant or pub during the last three months. SrCPUBTRF indicates how often the respondent's spouse has used public transportation during the last three months. SrCTRVABRD indicates whether the respondent's spouse has traveled abroad for more than 48 hours since the COVID-19 outbreak. SrCSHPF, SrCERRNDF, SrCRSTRNTE, SrCPUBTRF, and SrCTRVABRD are taken from the spouse's values to RrCSHPF, RrCERRNDF, RrCRSTRNTE, RrCPUBTRF, and RrCTRVABRD, respectively. In addition to the special missing values used in RrCSHPF, RrCERRNDF, RrCRSTRNTE, RrCPUBTRF, and RrCTRVABRD, SrCSHPF, SrCERRNDF, SrCRSTRNTE, SrCPUBTRF, and SrCTRVABRD employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, if the respondent reports that they have left their home since the outbreak, they are then asked to report how often they have done different activities since the COVID-19 outbreak, as compared to before the outbreak. Respondents can report that they have done an activity "not any more", "less often", "about the same", or "more often" compared to before the COVID-19 outbreak. One of these activities includes going shopping. At Round 2, respondents are asked to report if they have ever left their home during the last three months. If the respondent reports that they have left their home during the last three months, they are then asked to report how often they have done different activities during the last three months. One of these activities includes going shopping. However, this question in Round 2 utilizes a different response scale ("several times a week", "about once a week", "less than once a week", or "not at all") that is not comparable to the response scale used in Round 1. Because of this, RrCACHSHP and RrCSHPF are not considered comparable.

Questions about going to the post office, bank, or a public office; going to a restaurant or pub; using public transportation; or travelling abroad for more than 48 hours were not asked until Round 2, so RrCERRNDF, RrCRSTRNTE, RrCPUBTRF, and RrCTRVABRD, respectively, are not available at Round 1.

## Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents to report how often they went to a post office, bank, or public office; how often they went to a restaurant or pub; or how often they used public transportation during the last three months. The HRS COVID also does not ask respondents to report whether they traveled abroad for more than 48 hours since the COVID-19 outbreak.

The HRS COVID also asks additional questions that are not asked in SHARE, such as how often the respondent has left their home, visited friends, attended religious services outside of their home, exercised at home, done hobbies, crafts, or puzzles, watched television, done garden work or home repairs, read books, magazines, or newspapers, and met with social groups via video conference.

**Comparability with the Gateway Harmonized SHARE**

No comparable variables are available in the Gateway Harmonized SHARE.

### How Constructed:

At Rounds 1 and 2, respondents are asked to report how often they feel lonely. Respondents may report that they feel lonely "often", "some of the time", or "hardly ever or never". At Round 1, if the respondent reports that they feel lonely often or some of the time, they are then asked to report whether they felt lonely "more so", "less so", or "about the same" as before the outbreak of COVID-19. At Round 2, if respondents answered the initial loneliness question with any of the three possible answer responses, then they are asked to report whether they felt lonely "more so", "less so", or "about the same" as during the first round.

RrCLONELY indicates how often the respondent feels lonely. RrCLONELY is coded as 1 if the respondent reports that they hardly ever or never feel lonely. RrCLONELY is coded as 2 if the respondent reports that they feel lonely some of the time. RrCLONELY is coded as 3 if the respondent reports that they often feel lonely. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCLONELY is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFLONELY is a flag variable that indicates whether responses to RrCLONELY are imputed by SHARE. RrCFLONELY is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFLONELY is coded as plain missing (.) if the respondent did not participate in the current COVID round.

At Round 1, RrCFLONECH indicates how often the respondent felt lonely compared to before the outbreak of COVID-19. At Round 1, RrCFLONECH is coded as 0 if the respondent reports that they hardly ever or never

feel lonely. RrCFLONECH is coded as 1 if the respondent reports that they have felt lonely less often than before the outbreak of COVID-19. RrCFLONECH is coded as 2 if the respondent reports that they have felt lonely about the same amount as before the outbreak of COVID-19. RrCFLONECH is coded as 3 if the respondent reports that they have felt lonely more often than before the outbreak of COVID-19. At Round 2, RrCFLONECH indicates how often the respondent felt lonely compared to during the first round. At Round 2, RrCFLONECH is coded as 1 if the respondent reports that they have felt lonely less often than during the first round. RrCFLONECH is coded as 2 if the respondent reports that they have felt lonely about the same amount as during the first round. RrCFLONECH is coded as 3 if the respondent reports that they have felt lonely more often than during the first round. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCFLONECH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFFLONECH is a flag variable that indicates whether responses to RrCFLONECH are imputed by SHARE. RrCFFLONECH is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFFLONECH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCLONELY indicates how often the respondent's spouse feels lonely. SrCFLONELY is a flag variable that indicates whether the respondent's spouse's responses to SrCLONELY are imputed by SHARE. SrCFLONECH indicates how often the respondent's spouse has felt lonely compared to before the COVID-19 pandemic/during the first round. SrCFFLONECH is a flag variable that indicates whether the respondent's spouse's responses to SrCFLONECH are imputed by SHARE. SrCLONELY, SrCFLONELY, SrCFLONECH, and SrCFFLONECH are taken from the spouse's values to RrCLONELY, RrCFLONELY, RrCFLONECH, and RrCFFLONECH, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, respondents are first asked to report how often they feel lonely and may respond with "often", "some of the time", or "hardly ever or never". If the respondent reports that they feel lonely often or some of the time, they are then asked to report whether they felt lonely "more so", "less so", or "about the same" as before the outbreak of COVID-19.

At Round 2, respondents are first asked to report how often they feel lonely and may respond with "often", "some of the time", or "hardly ever or never". If they answer with any of the three possible responses, they are then asked to report whether they felt lonely "more so", "less so", or "about the same" as during the first round.

Due to the skip pattern in Round 1, a value of 0 for "not at all" is assigned in RrCFLONECH in Round 1 if the respondent reports that they hardly ever or never feel lonely. This value is not assigned in Round 2 as Round 2 does not have the same skip pattern.

## Differences with the Harmonized HRS COVID

The HRS COVID asks loneliness questions in the self-completion questionnaire and does not provide imputed values as part of its public release. The Harmonized HRS COVID has comparable versions of the variables listed here.

Please note that the RrCFLONECH in Round 1 of the Gateway Harmonized SHARE COVID has an additional response (0.Not at all) to reflect the skip pattern.

## Comparability with the Gateway Harmonized SHARE

RrCLONELY: This variable is related to RrFLONEX in the Gateway Harmonized SHARE. Unlike RrCLONELY, which refers to the frequency of the respondent's feeling of loneliness with no time reference, RrFLONEX refers to the frequency of the respondent's feeling of loneliness in the week prior to the interview. In addition, RrCLONELY and RrFLONEX use different scales. The Gateway Harmonized SHARE also includes RrFLONE, which indicates whether the respondent experienced feeling lonely much of the time during the week prior to the interview.

**SHARE Variables Used:**

Round 1 Covid-19:

|           |                                                   |

### How Constructed:

At Rounds 1 and 2, respondents are asked to report whether they felt nervous, anxious, or on edge in the last month. Respondents may report either "yes" or "no". At Round 1, if the respondent reports that they felt nervous, anxious, or on edge in the last month, they are then asked to report whether they felt nervous, anxious, or on edge "more so", "less so", or "about the same" as before the outbreak of COVID-19. At Round 2, if the respondent reports that they felt nervous, anxious, or on edge in the last month, they are then asked to report whether they felt nervous, anxious, or on edge "more so", "less so", or "about the same" as during the first round.

RrCFNERV1M indicates whether the respondent felt nervous, anxious, or on edge in the last month. RrCFNERV1M is coded as 0 if the respondent reports that they have not felt nervous, anxious, or on edge in the last month. RrCFNERV1M is coded as 1 if the respondent reports that they have felt nervous, anxious, or on edge in the last month. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCFNERV1M is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFFNERV1M is a flag variable that indicates whether responses to RrCFNERV1M are imputed by SHARE. RrCFFNERV1M is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFFNERV1M is coded as plain missing (.) if the respondent did not participate in the current COVID round.

At Round 1, RrCFNERVCH indicates how often the respondent felt nervous, anxious, or on edge compared to before the outbreak of COVID-19. At Round 2, RrCFNERVCH indicates how often the respondent felt nervous, anxious, or on edge compared to during the first round. RrCFNERVCH is coded as 0 if the respondent reports that they have not felt nervous, anxious, or on edge in the last month. RrCFNERVCH is coded as 1

if the respondent reports that they have felt less nervous, anxious, or on edge than before the respective timeframes. RrCFNERVCH is coded as 2 if the respondent reports that they have felt nervous, anxious, or on edge about the same amount as before the respective timeframes. RrCFNERVCH is coded as 3 if the respondent reports that they have felt more nervous, anxious, or on edge than before the respective timeframes. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCFNERVCH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFFNERVCH is a flag variable that indicates whether responses to RrCFNERVCH are imputed by SHARE. RrCFFNERVCH is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFFNERVCH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCFNERV1M indicates whether the respondent's spouse felt nervous, anxious, or on edge in the last month. SrCFFNERV1M is a flag variable that indicates whether the respondent's spouse's responses to SrCFNERV1M are imputed by SHARE. SrCFNERVCH indicates how often the respondent's spouse felt nervous, anxious, or on edge compared to before the COVID-19 pandemic/during the first round. SrCFFNERVCH is flag variable that indicates whether the respondent's spouse's responses to SrCFFNERVCH are imputed by SHARE. SrCFNERV1M, SrCFFNERV1M, SrCFNERVCH, and SrCFFNERVCH are taken from the spouse's values to RrCFNERV1M, RrCFFNERV1M, RrCFNERVCH, and RrCFFNERVCH, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, if the respondent reports that they felt nervous, anxious, or on edge in the last month, they are then asked to report whether they felt nervous, anxious, or on edge "more so", "less so", or "about the same" as before the outbreak of COVID-19. At Round 2, if the respondent reports that they felt nervous, anxious, or on edge in the last month, they are then asked to report whether they felt nervous, anxious, or on edge "more so", "less so", or "about the same" as during the first round.

## Differences with the Harmonized HRS COVID

Unlike the SHARE Corona survey, the HRS COVID does not ask respondents to report whether the respondent felt nervous, anxious, or on edge in the last month and how often they felt nervous, anxious, or on edge compared to before the COVID-19 pandemic. The HRS COVID does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

No comparable variables are available in the Gateway Harmonized SHARE.

## SHARE Variables Used:

### Round 1 Covid-19:

|            |                                                    |
|------------|----------------------------------------------------|

### How Constructed:

At Rounds 1 and 2, respondents are asked to report whether they felt sad or depressed in the last month. Respondents may report either "yes" or "no". At Round 1, if the respondent reports that they felt sad or depressed in the last month, they are then asked to report whether they felt sad or depressed "more so", "less so", or "about the same" as before the outbreak of COVID-19. At Round 2, if the respondent reports that they felt sad or depressed in the last month, they are then asked to report whether they felt sad or depressed "more so", "less so", or "about the same" as during the first round.

RrCFDEPRES1M indicates whether the respondent felt sad or depressed in the last month. RrCFDEPRES1M is coded as 0 if the respondent reports that they have not felt sad or depressed in the last month. RrCFDEPRES1M is coded as 1 if the respondent reports that they have felt sad or depressed in the last month. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCFDEPRES1M is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFFDEPRES1M is a flag variable that indicates whether responses to RrCFDEPRES1M are imputed by SHARE. RrCFFDEPRES1M is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFFDEPRES1M is coded as plain missing (.) if the respondent did not participate in the current COVID round.

At Round 1, RrCFDPRSCH indicates how often the respondent felt sad or depressed compared to before the outbreak of COVID-19. At Round 2, RrCFDPRSCH indicates how often the respondent felt sad or depressed compared to during the first round. RrCFDPRSCH is coded as 0 if the respondent reports that they have not felt sad or depressed in the last month. RrCFDPRSCH is coded as 1 if the respondent reports that they have felt less sad or depressed than before the respective timeframes. RrCFDPRSCH is coded as 2 if the

respondent reports that they have felt sad or depressed about the same amount as before the respective timeframes. RrCFDPRSCH is coded as 3 if the respondent reports that they have felt more sad or depressed than before the respective timeframes. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCFDPRSCH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFFDPRSCH is a flag variable that indicates whether responses to RrCFDPRSCH are imputed by SHARE. RrCFFDPRSCH is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFFDPRSCH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCFDEPRES1M indicates whether the respondent's spouse felt sad or depressed in the last month. SrCFFDEPRES1M is a flag variable that indicates whether the respondent's spouse's responses are imputed by SHARE. SrCFDPRSCH indicates how often the respondent's spouse felt sad or depressed compared to before the COVID-19 pandemic. SrCFFDPRSCH is a flag variable that indicates whether the respondent's spouse's responses to SrCFDPRSCH are imputed by SHARE. SrCFDEPRES1M, SrCFFDEPRES1M, SrCFDPRSCH, and SrCFFDPRSCH are taken from the spouse's values to RrCFDEPRES1M, RrCFFDEPRES1M, RrCFDPRSCH, and RrCFFDPRSCH, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

## Cross Round Differences in SHARE

At Round 1, if the respondent reports that they felt sad or depressed in the last month, they are then asked to report whether they felt sad or depressed "more so", "less so", or "about the same" as before the outbreak of COVID-19. At Round 2, if the respondent reports that they felt sad or depressed in the last month, they are then asked to report whether they felt sad or depressed "more so", "less so", or "about the same" as during the first round.

## Differences with the Harmonized HRS COVID

The HRS COVID does not ask how often the respondent felt sad or depressed compared to before the outbreak of the coronavirus. It also does not provide imputed values as part of its public release.

## Comparability with the Gateway Harmonized SHARE

RrCFDEPRES1M: This variable is comparable to RwDEPRESS, which is part of the EURO-D depressive symptom scale, in the Gateway Harmonized SHARE.

## SHARE Variables Used:

### Round 1 Covid-19:

|            |                                                      |
|------------|------------------------------------------------------|
| CDEPRESS   | Health: more or less depressed since outbreak        |
| CDEPRESS_F | Health: more or less depressed since outbreak - flag |
| DEPRESS    | Health: sad or depressed in last month               |
| DEPRESS_F  | Health: sad or depressed in last month - flag        |

### Round 2 Covid-19:

|           |                                                         |
|-----------|---------------------------------------------------------|
| CAMH002_  | Health: sad or depressed in last month                  |
| CAMH113_1 | Health: less, about the same or more depressed as durin |

Trouble Sleeping

| Round | Variable    | Label                                                         | Type  |

### How Constructed:

At Rounds 1 and 2, respondents are asked to report whether they have had trouble sleeping recently. Respondents may report either "yes" or "no". At Round 1, if the respondent reports that they have had trouble sleeping recently, they are then asked to report whether they had trouble sleeping "more so", "less so", or "about the same" as before the outbreak of COVID-19. At Round 2, if the respondent reports that they have had trouble sleeping recently, they are then asked to report whether they had trouble sleeping "more so", "less so", or "about the same" as during the first round.

RrCTRSLEEP indicates whether the respondent had trouble sleeping recently. RrCTRSLEEP is coded as 0 if the respondent reports that they have not had trouble sleeping recently. RrCTRSLEEP is coded as 1 if the respondent reports that they have had trouble sleeping recently. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCTRSLEEP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFTRSLEEP is a flag variable that indicates whether responses to RrCTRSLEEP are imputed by SHARE. RrCFTRSLEEP is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFTRSLEEP is coded as plain missing (.) if the respondent did not participate in the current COVID round.

At Round 1, RrCTRSLPCH indicates how often the respondent had trouble sleeping compared to before the outbreak of COVID-19. At Round 2, RrCTRSLPCH indicates how often the respondent had trouble sleeping compared to during the first round. RrCTRSLPCH is coded as 0 if the respondent reports that they have not had trouble sleeping recently. RrCTRSLPCH is coded as 1 if the respondent reports that they have had less trouble sleeping than before the respective timeframes. RrCTRSLPCH is coded as 2 if the respondent reports that they have had trouble sleeping about the same amount as before the respective timeframes. At

Round 1, RrCTRSLPCH is coded as 3 if the respondent reports that they have had more trouble sleeping than before the respective timeframes. At Round 2, don't know, refused, and missing responses are coded as special missing values (.d), (.r), and (.m), respectively. RrCTRSLPCH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

RrCFTRSLPCH is a flag variable that indicates whether responses to RrCTRSLPCH are imputed by SHARE. RrCFTRSLPCH is only available at Round 1, and is assigned 0 if responses are not imputed and 1 if responses are imputed. RrCFTRSLPCH is coded as plain missing (.) if the respondent did not participate in the current COVID round.

SrCTRSLEEP indicates whether the respondent's spouse had trouble sleeping recently. SrCFTRSLPCH is a flag variable that indicates whether the respondent's spouse's responses to SrCTRSLEEP are imputed by SHARE. SrCTRSLEEP indicates how often the respondent's spouse had trouble sleeping compared to before the COVID-19 pandemic/during the first round. SrCFTRSLPCH is a flag variable that indicates whether the respondent's spouse's responses to SrCTRSLEEP are imputed by SHARE. SrCTRSLEEP, SrCFTRSLPCH, SrCTRSLEEP, and SrCFTRSLPCH are taken from the spouse's values to RrCTRSLEEP, RrCFTRSLPCH, RrCTRSLEEP, and RrCFTRSLPCH, respectively. In addition to the special missing values used in the respondent variables, the spouse variables employ two additional special missing values. Special missing value (.u) is assigned if the respondent does not report being coupled in the current round. Special missing value (.v) is assigned if the respondent reports being coupled in the current round but their spouse is not interviewed.

### Cross Round Differences in SHARE

At Round 1, if the respondent reports that they have had trouble sleeping recently, they are then asked to report whether they had trouble sleeping "more so", "less so", or "about the same" as before the outbreak of COVID-19. At Round 2, if the respondent reports that they have had trouble sleeping recently, they are then asked to report whether they had trouble sleeping "more so", "less so", or "about the same" as during the first round.

### Differences with the Harmonized HRS COVID

The HRS COVID does not ask whether the respondent had trouble sleeping recently and how often the respondent had trouble sleeping compared to before the outbreak of the coronavirus. It also does not provide imputed values as part of its public release.

### Comparability with the Gateway Harmonized SHARE

RrCTRSLEEP: This variable is comparable to RwsSLEEP, which is part of the EURO-D depressive symptom scale, in the Gateway Harmonized SHARE.

### SHARE Variables Used:

#### Round 1 Covid-19:

|           |                                                        |
|-----------|--------------------------------------------------------|
| CTSLEEP   | Health: more or less trouble sleeping since outbreak   |
| CTSLEEP_F | Health: more or less trouble sleeping since outbreak - |
| TSLEEP    | Health: trouble sleeping recently                      |
| TSLEEP_F  | Health: trouble sleeping recently - flag               |

#### Round 2 Covid-19:

|           |                                                         |
|-----------|---------------------------------------------------------|

### How Constructed:

These variables are based on the information collected as part of the Oxford Covid-19 Government Response Tracker (OxCGRT). Daily data were collected to indicate the pandemic response measures enacted by governments, with stricter policies indicated by higher values. The daily policy data, notes about the policies, and additional information are available through OxCGRT: <https://github.com/OxCGRT/covid-policy-dataset>. Please cite this data appropriately, the recommended citation is provided in the Introduction to the codebook and on the OxCGRT website. We have transformed this data from daily to monthly, as described below, in order to be used with the public survey data.

The following variables indicate the containment and closure policies in place around the time of the respondent's interview. Because there is an expected lag between the policy change and any impact to the respondent, each variable has been assigned the value present for the last day of the previous month. For example, if the respondent's interview was in July 2020, then these variables have been assigned the value present on June 30, 2020. These policies are further differentiated by vaccination status, with variables ending in "v" indicating the value for vaccinated individuals, and variables ending in "n" indicating the value for non-vaccinated individuals. If there is no differentiation between vaccinated and non-vaccinated individuals for the particular date, then these variables take the value of the policy assigned to everyone.

Rr\_C1\_V and Rr\_C1\_N indicate the value of policies associated with school and university closings for vaccinated and non-vaccinated individuals, respectively. They are coded as follows: 0. No measures, 1. Recommend closing or all schools open with alterations resulting in significant differences compared to non-Covid-19 operations, 2. Require closing (only some levels or categories, e.g., just high school or just public schools), 3. Requires closing all levels.

Rr\_C2\_V and Rr\_C2\_N indicate the value of policies associated with workplace closings for vaccinated and non-vaccinated individuals, respectively. They are coded as follows: 0. No measures, 1. Recommend closing (or recommend work from home) or all businesses open with alterations resulting in significant differences compared to non-Covid-19 operation, 2. Require closing (or work from home) for some sectors or categories of workers, 3. Require closing (or work from home) for all-but-essential workplaces (e.g., grocery stores, doctors).

Rr\_C3\_V and Rr\_C3\_N indicate the value of policies associated with the cancellation of public events for vaccinated and non-vaccinated individuals, respectively. They are coded as follows: 0. No measures. 1. Recommend cancelling, 2. Require cancelling.

Rr\_C4\_V and Rr\_C4\_N indicate the value of policies associated with restrictions on gatherings for vaccinated and non-vaccinated individuals, respectively. They are coded as follows: 0. No restrictions, 1. Restrictions on very large gatherings (the limit is above 1000 people), 2. Restrictions on gatherings between 101-1000 people, 3. Restrictions on gatherings between 11-100 people, 4. Restrictions on gatherings of 10 people or less.

Rr\_C5\_V and Rr\_C5\_N indicate the value of policies associated with public transport closures for vaccinated and non-vaccinated individuals, respectively. They are coded as follows: 0. No measures, 1. Recommend closing (or significantly reduce volume/route/means of transport available), 2. Require closing (or prohibit most citizens from using it).

Rr\_C6\_V and Rr\_C6\_N indicate the value of policies associated with stay-at-home or shelter-in-place requirements for vaccinated and non-vaccinated individuals, respectively. They are coded as follows: 0.

No measures, 1. Recommend not leaving house, 2. Require not leaving house with exceptions for daily exercise, grocery shopping, and “essential” trips, 3. Require not leaving house with minimal exceptions (e.g., allowed to leave once a week, or only one person can leave at a time, etc.).

Rr\_C7\_V and Rr\_C7\_N indicate the value of policies associated with restrictions on internal movement between cities or regions for vaccinated and non-vaccinated individuals, respectively. They are coded as follows: 0. No measures, 1. Recommend not to travel between regions/cities, 2. Internal movement restrictions in place.

Rr\_C8\_V and Rr\_C8\_N indicate the value of policies associated with international travel controls, meaning the policy for foreign traveler and not the country’s citizens for vaccinated and non-vaccinated individuals, respectively. They are coded as follows: 0. No restrictions, 1. Screening arrivals, 2. Quarantine arrivals from some or all regions, 3. Ban arrivals from some regions, 4. Ban on all regions or total border closure.

Because the respondent can also be impacted by how frequently a policy is changing, we have also provided variables indicating the count of changes, the minimum policy value, and the maximum policy value for the previous month. For example, if the respondent’s interview was in July 2020, then these variables will indicate the number of changes, minimum, and maximum value for a given policy in June 2020. The variables indicating the number of changes for a given policy are called Rr\_C#\_V\_CHG and Rr\_C#\_N\_CHG. The variables indicating the minimum value for a given policy are called Rr\_C#\_V\_MIN and Rr\_C#\_N\_MIN. The variables indicating the maximum value for a given policy are called Rr\_C#\_V\_MAX and Rr\_C#\_N\_MAX.

If there was no data available for a given date, then these variables will take a special missing value .q. These variables are assigned a blank missing (.) for respondents who did not participate in the current COVID round.

### **Cross Round Differences in SHARE**

### How Constructed:

The following variables indicate the economic policies in place around the time of the respondent's interview. Because there is an expected lag between the policy change and any impact to the respondent, each variable has been assigned the value present for the last day of the previous month. For example, if the respondent's interview was in July 2020, then these variables have been assigned the value present on June 30, 2020.

The E3 and E4 policies indicate the sum of all fiscal measures and international support, respectively, in the previous month. For example, if the respondent's interview was in July 2020, then these variables will be assigned the total of all spending in USD in June 2020.

Rr\_E1 indicates the value of policies associated with income support in the form of providing direct cash payments to people who lose their jobs or cannot work. It is coded as follows: 0. No income support, 1. Government is replacing less than 50% of lost salary (or if a flat sum, it is less than 50% median salary), 2. Government is replacing 50% or more of lost salary (or if a flat sum, it is greater than 50% median salary).

Rr\_E2 indicates the value of policies associated with debt/contract relief, specifically if the government is freezing financial obligations for households (e.g., stopping loan repayments, preventing services like water from stopping, or banning evictions). It is coded as follows: 0. No debt/contract relief, 1. Narrow relief, specific to one kind of contract, 2. Broad debt/contract relief.

Rr\_E3\_TOT indicates the sum of all announced economic stimulus spending in USD, not including any previously announced spending. It includes the monetary value of fiscal stimuli, including any spending or tax cuts that are NOT included in E4, H4, or H5.

Rr\_E4\_TOT indicates the sum of all announced offers of COVID-19 related aid spending to other countries in USD.

Because the respondent can also be impacted by how frequently a policy is changing, we have also provided variables indicating the count of changes, the minimum policy value, and the maximum policy value for the previous month for the E1 and E2 policies. For example, if the respondent's interview was in July 2020, then these variables will indicate the number of changes, minimum, and maximum value for a given policy in June 2020. The variable indicating the number of changes for a given policy is called Rr\_E#\_CHG. The variable indicating the minimum value for a given policy is called Rr\_E#\_MIN. The variable indicating the maximum value for a given policy is called Rr\_E#\_MAX.

If there was no data available for a given date, then these variables will take a special missing value .q. These variables are assigned a blank missing (.) for respondents who did not participate in the current COVID round.

### How Constructed:

The following variables indicate the health system policies in place around the time of the respondent's interview. Because there is an expected lag between the policy change and any impact to the respondent, each variable has been assigned the value present for the last day of the previous month. For example, if the respondent's interview was in July 2020, then these variables have been assigned the value present on June 30, 2020.

The H4 and H5 policies indicate the sum of all investments for healthcare and vaccines, respectively, in the previous month. For example, if the respondent's interview was in July 2020, then these variables will be assigned the total of all investments in USD in June 2020.

The H6 and H8 policies are further differentiated by vaccination status, with variables ending in "v" indicating the value for vaccinated individuals, and variables ending in "n" indicating the value for non-vaccinated individuals. If there is no differentiation between vaccinated and non-vaccinated individuals for the particular date, then these variables take the value of the policy assigned to everyone.

Rr\_H1 indicates the value of policies associated with public information campaigns. It is coded as follows: 0. No COVID-19 public information campaign, 1. Public officials urging caution about COVID-19, 2. Coordinated public information campaign (e.g., across traditional and social media).

Rr\_H2 indicates the value of policies associated with government policies on who has access to testing. It is coded as follows: 0. No testing policy, 1. Only those who both (a) have symptoms and (b) meet specific criteria (e.g., key workers, admitted to hospital, came into contact with a known case, returned from overseas), 2. Testing of anyone showing COVID-19 symptoms, 3. Open public testing (e.g., “drive through” testing available to asymptomatic people).

Rr\_H3 indicates the value of policies associated with contract tracing after a positive diagnosis. It is coded as follows: 0. No contract tracing, 1. Limited contract tracing, not done for all cases, 2. Comprehensive contact tracing, done for all identified cases.

Rr\_H4\_TOT indicates the sum of all emergency investment in healthcare in USD. It includes all announced short-term spending on the healthcare system, e.g., hospitals, masks, etc. and only includes amounts additional to previously announced spending.

Rr\_H5\_TOT indicates the sum of all investments in vaccines in USD. It includes all announced public spending on COVID-19 vaccine development and only includes amounts additional to previously announced spending.

Rr\_H6\_V and Rr\_H6\_N indicate the value of policies regarding the use of facial coverings outside the home for vaccinated and non-vaccinated individuals, respectively. They are coded as follows: 0. No policy, 1. Recommended, 2. Required in some specified shared/public spaces outside the home with other people present, or some situations when social distancing is not possible, 3. Required in all shared/public spaces outside the home with other people present or all situations when social distancing is not possible, 4. Required outside the home at all times regardless of location or presence of other people.

Rr\_H7 indicates the value of policies for vaccine delivery for different groups. It is coded as follows: 0. No availability, 1. Availability for one of the following: key workers/clinically vulnerable groups (non-elderly)/elderly groups, 2. Availability for two of the following: key workers/clinically vulnerable groups (non-elderly)/elderly groups, 3. Availability for all of the following: key workers/clinically vulnerable groups (non-elderly)/elderly groups, 4. Availability for all three plus partial additional availability (select broad groups/ages), 5. Universal availability.

Rr\_H8\_V and Rr\_H8\_N indicate the value of policies for protecting elderly people (as defined locally) in long term care facilities and/or the community and home setting for vaccinated and non-vaccinated individuals, respectively. They are coded as follows: 0. No measures, 1. Recommended isolation, hygiene, and visitor restrictions measures in LTCFs and/or elderly people to stay at home, 2. Narrow restrictions for isolation, hygiene in LTCFs, some limitations on external visitors and/or restrictions protecting elderly people at home, 3. Extensive restrictions for isolation and hygiene in LTCFs, all non-essential external visitors prohibited, and/or all elderly people required to stay at home and not leave the home with minimal exceptions, and receive no external visitors.

Because the respondent can also be impacted by how frequently a policy is changing, we have also provided variables indicating the count of changes, the minimum policy value, and the maximum policy value for the previous month for H1-H3 and H6-H8. For example, if the respondent’s interview was in July 2020, then these variables will indicate the number of changes, minimum, and maximum value for a given policy in June 2020. The variables indicating the number of changes for a given policy are called Rr\_H#\_CHG for H1-H3 and H7, and Rr\_H#\_V\_CHG and Rr\_H#\_N\_CHG for H6 and H8. The variables indicating the minimum value for a given policy are called Rr\_H#\_MIN for H1-H3 and H7, and Rr\_H#\_V\_MIN and Rr\_H#\_N\_MIN for H6 and H8. The variables indicating the maximum value for a given policy are called Rr\_H#\_MAX for H1-H3 and H7, and Rr\_H#\_V\_MAX and Rr\_H#\_N\_MAX for H6 and H8.

If there was no data available for a given date, then these variables will take a special missing value .q. These variables are assigned a blank missing (.) for respondents who did not participate in the current COVID round.

## Cross Round Differences in SHARE

No differences known.

### How Constructed:

The following variables indicate the vaccination policies in place around the time of the respondent's interview. Because there is an expected lag between the policy change and any impact to the respondent, each variable has been assigned the value present for the last day of the previous month. For example, if the respondent's interview was in July 2020, then these variables have been assigned the value present on June 30, 2020.

We are using the summary indicators produced by OxCGRT, however each of the vaccination policy variables are also reported as 53 different variables, describing different age groups, types of workers, or other at-risk groups in the original OxCGRT data.

Rr\_V1 indicates the value of policies associated with a prioritized plan for vaccine rollout. It is coded as follows: 0. No plan, 1. A prioritized plan is in place, 2. Universal/general eligibility (no prioritization between groups).

Rr\_V2A indicates the value of policies indicating whether any categories of people are receiving vaccines. It is coded as follows: 0. No categories are receiving vaccines, 1. Vaccines are available to some categories, 2. Vaccines are available to anyone over the age of 16 years, 3. Vaccines are available to anyone over the age of 16 years plus one or both of 5-15 years and 0-4 years.

Rr\_V2B indicates the lowest age range of the general population being vaccinated.

Rr\_V2C indicates the lowest age range of the at risk population being vaccinated.

Rr\_V2B and Rr\_V2C are coded as follows: 1. 0-4 years, 2. 5-15 years, 3. 16-19 years, 4. 20-24 years, 5. 25-29 years, 6. 30-34 years, 7. 35-39 years, 8. 40-44 years, 9. 45-49 years, 10. 50-54 years, 11. 55-59 years, 12. 60-64 years, 13. 65-69 years, 14. 70-74 years, 15. 75-79 years, 16. 80+ years.

Rr\_V2D indicates the number of categories selected from non-elderly and medically/clinically vulnerable groups. The groups included are: (1) risk with age below 60 (one or more selected counts as 1 per category), (2) clinically vulnerable/chronic illness/significant underlying health condition (excluding

elderly and disabled), (3) disabled people, (4) pregnant people, (5) people living with a vulnerable/shielding person or other priority group. It is coded as follows: 0. No categories are receiving vaccines, 1. 1 or 2 categories in group selected, 2. 3 or more categories selected or all from "general 16-19 years" up to "general 80+ years" present.

Rr\_V2E indicates the number of categories selected from the education groups. The groups included are: (1) educators, (2) primary and secondary school students, (3) tertiary education students. It is coded as follows: 0. No categories are receiving vaccines, 1. 1 category in group selected, 2. 2 or more categories selected or all from "general 16-19 years" up to "general 80+ years" present.

Rr\_V2F indicates the number of categories selected from the non-healthcare frontline workers. The groups included are: (1) policy/first responders, (2) airport/border/airline staff, (3) factory workers, (4) frontline retail workers, (5) military, (6) other high contact professions/groups (taxi drivers, security guards), (7) frontline/essential workers (when subcategories are not specified - triggers an automatic 2). It is coded as follows: 0. No categories are receiving vaccines, 1. 1 or 2 categories in group selected, 2. 3 or more categories selected or all from "general 16-19 years" up to "general 80+ years" present.

Rr\_V2G indicates the number of categories selected from the healthcare frontline workers. The groups included are: (1) staff working in an elderly care home, (2) healthcare workers/carers (excluding care home staff). 0. No categories are receiving vaccines, 1. 1 category in group selected, 2. 2 categories selected or all from "general 16-19 years" up to "general 80+ years" present.

Rr\_V3 indicates the overall approach taken to vaccine funding. It is coded as follows: 0. No availability, 2. Full cost to the individual for all categories identified in V2, 2. Full cost to the individual for some categories identified in V2, some subsidy for other categories, 3. Partial funding by the government for all of the categories identified in V2, 4. Partial funding by the government for some categories identified in V2, full funding for other categories, 5. All categories fully funded by the government.

Rr\_V4 indicates the existence of mandatory vaccinations. It is coded as: 0. No requirement to be vaccinated, 1. Requirement to be vaccinated is in place for one or more groups.

Because the respondent can also be impacted by how frequently a policy is changing, we have also provided variables indicating the count of changes, the minimum policy value, and the maximum policy value for the previous month. For example, if the respondent's interview was in July 2020, then these variables will indicate the number of changes, minimum, and maximum value for a given policy in June 2020. The variable indicating the number of changes for a given policy is called Rr\_V#\_CHG (not available for V2B and V2C). The variable indicating the minimum value for a given policy is called Rr\_V#\_MIN. The variable indicating the maximum value for a given policy is called Rr\_V#\_MAX (not available for V2B and V2C).

If there was no data available for a given date, then these variables will take a special missing value .q. These variables are assigned a blank missing (.) for respondents who did not participate in the current COVID round.

### How Constructed:

The following variables indicate the values of indices summarizing the policies in place around the time of the respondent's interview. Because there is an expected lag between the policy change and any impact to the respondent, each variable has been assigned the value present for the last day of the previous month. For example, if the respondent's interview was in July 2020, then these variables have been assigned the value present on June 30, 2020.

Because these indices use ordinal indicators with different scales, a sub-index score that normalizes each of the indicators first created. Additionally, C1-C7, E1, H1, and H7-H8 have an additional binary flag variable that is taken into account. Each sub-index score for any given indicator on any given day is calculated using the maximum value of the indicator and the recorded policy value, the presence of a flag variable and the recorded flag value. This produces a normalized sub-index score between 0 and 100. In the subsequent calculation of the index values, each individual component indicator is given equal weight using a simple average. For more information on the calculation of the index values, please see [https://github.com/OxCGRT/covid-policy-dataset/blob/main/documentation\\_and\\_codebook.md#calculation-of-policy-indices](https://github.com/OxCGRT/covid-policy-dataset/blob/main/documentation_and_codebook.md#calculation-of-policy-indices).

For each index, OxCGRT provides four versions with different treatments of vaccine-differentiated policies: (1) Nonvax - constructs the index using "non-vaccinated" policies if present, or otherwise uses

“everyone” policies, (2) Vax - constructs the index using vaccinated policies if present, or otherwise using everyone policies, (3) Simple average “takes the sum of “nonvax” and “vax” indices and divides them by 2, (4) Weighted average “takes an average of the “nonvax” and “vax” indices weighted by the proportion of the population that is vaccinated. We have chosen to provide the weighted average version of the indices, but you can access all versions using OxCGR data.

Rr\_GOVRESP indicates the government response index, which summarizes C1-C8, E1-E2, H1-H3, and H6-H8.

Rr\_CONTAIN indicates the containment and health index, which summarizes C1-C8, H1-H3, and H6-H8.

Rr\_STRINGENCY indicates the stringency index, which summarizes C1-C8 and H1.

Rr\_ECONSUPPORT indicates the economic support index, which summarizes E1 and E2.

Because the respondent can also be impacted by how frequently policies are changing, we have also provided variables indicating the count of changes, the minimum policy value, and the maximum policy value for the previous month. For example, if the respondent’s interview was in July 2020, then these variables will indicate the number of changes, minimum, and maximum value for a given index in June 2020. The variable indicating the number of changes for a given index is called Rr\_INDEX\_CHG. The variable indicating the minimum value for a given index is called Rr\_INDEX\_MIN. The variable indicating the maximum value for a given index is called Rr\_INDEX\_MAX.

If there was no data available for a given date, then these variables will take a special missing value (.q). These variables are assigned a blank missing (.) for respondents who did not participate in the current COVID round.

While these four indices have been provided, users are also encouraged to create their own indices using the policies most applicable to their research question. With the data provided in this dataset, each of the four versions of an index can be created.

**How Constructed:**

Rr\_CCASES\_TOT indicates the cumulative number of reported COVID-19 cases since the beginning of the pandemic.

Rr\_CCASES\_NEW indicates the number of reported COVID-19 cases reported from the last day of the previous month to the last day of the current month.

Rr\_CDEATHS\_TOT indicates the cumulative number of deaths attributed to COVID-19 since the beginning of the pandemic.

Rr\_CDEATHS\_NEW indicates the number of deaths attributed to COVID-19 from the last day of the previous month to the last day of the current month.

If there was no data available for a given date, then these variables will take a special missing value (.q). These variables are assigned a blank missing (.) for respondents who did not participate in the current COVID round.

| R2_POPVAX50   | 49263 | 1.29  | 0.45    | 1.00    | 2.00    |

### How Constructed:

Rr\_POPVAX\_TOT indicates the percentage of the fully vaccinated population in the jurisdiction.

Rr\_POPVAX\_NEW indicates the change in the percentage of the fully vaccinated population from the last day of the previous month to the last day of the current month.

Rr\_POPVAX50 indicates whether the minority or majority of the population is fully vaccinated. It is coded as 0 if under 50% of the population is fully vaccinated, and is coded as 1 if 50% or more of the population is fully vaccinated.

If there was no data available for a given date, then these variables will take a special missing value (.q). These variables are assigned a blank missing (.) for respondents who did not participate in the current COVID round.
