Preface

The Survey of Health, Ageing and Retirement in Europe (SHARE) is a longitudinal household survey for the study of retirement and health among the elderly in continental Europe. It is modeled on the Health and Retirement Study (HRS) and the English Longitudinal Study of Ageing (ELSA), which are similar longitudinal surveys in the United States and England. Part of the reason for the close connection is to allow cross-country comparisons using these data.

In order to make the data more accessible to researchers and to facilitate such comparisons, we, the USC Gateway to Global Aging team, created the Gateway Harmonized SHARE, a user-friendly version of a subset of data from the SHARE interviews. The Gateway Harmonized SHARE initiative is part of a larger set of projects. With funding and support from the National Institute on Aging, we have also created the Harmonized HRS (United States), Harmonized MHAS (Mexico), Harmonized ELSA (England), Harmonized CRELES (Costa Rica), Harmonized KLoSA (South Korea), Harmonized JSTAR (Japan), Harmonized TILDA (Ireland), Harmonized CHARLS (China), Harmonized ELSI (Brazil), Harmonized SPS (Chile), Harmonized LASI (India), and Harmonized MARS (Malaysia) data. Further information about these Harmonized data files with questionnaires and other metadata is available on our searchable website, <https://g2aging.org/>.

In creating the Harmonized data files, we have followed the RAND HRS and Harmonized HRS conventions of variable naming and data structure. The RAND HRS is a user-friendly version of a subset of the HRS that the RAND Center for the Study of Aging created to increase usability. The Harmonized HRS is a supplementary dataset to the RAND HRS, which also includes a subset of the HRS data that the Gateway to Global Aging Data team has created to increase usability of a greater number of HRS variables. The Gateway Harmonized SHARE includes variables with a similar naming convention that mimics the RAND HRS, Harmonized HRS, and other Harmonized variables. This document describes these data.

Note, however, that SHARE license agreements do not allow us to disseminate the data directly. Instead, SHARE distributes the Gateway Harmonized SHARE dataset in a separate download, which is made available on their website at <https://share-eric.eu/data/>. Additional information about SHARE can be obtained from SHARE's website at <https://share-eric.eu/>.

We are grateful for the continuing support of and funding from NIA. In interpreting the SHARE data, we greatly benefited from the help and insights of SHARE staff members. In particular, we thank Giuseppe De Luca, Dimitris Christelis, Giacomo Pasini, Enrica Croda, and Stefan Gruber. We are indebted to Raquel Fonseca for her contributions in the early stage of this project. We have greatly benefited from discussions with and the suggestions from our colleagues Erik Meijer, Marco Angrisani, Vincenzo Atella, Federico Belotti, Alexandra Crosswell, Michael Hurd, Arie Kapteyn, Jeremy Lupoli, Regan Main, Michael Moldoff, Andrea Piano Mortari, Susann Rohwedder, Bas Weerman, Gema Zamarro, Julie Zissimopoulos, Sara Zuzzi, and the RAND HRS team. We would also like to acknowledge our current and former colleagues at the Gateway to Global Aging Data: Sandy Chien, Yizhou Chen, Kanghong Shao, Giacomo Rebellato, Hunter Green, Sidney Beaumaster, Marieta Valev, Victoria Yonter, Samuel Lau, and Ashley Lin.

Requested Acknowledgment

We ask all users of the Gateway Harmonized SHARE to please inform our team of any written analysis using data from the Gateway Harmonized SHARE or information from the Gateway Harmonized SHARE Codebook by sending an email to papers@g2aging.org. We also ask users to include the following acknowledgement in their written work:

This analysis uses data or information from the Gateway Harmonized SHARE dataset and Codebook, Version G as of October 2024 (using release g.o.o) developed by the Gateway to Global Aging Data. The development of the Gateway Harmonized SHARE was funded by the National Institute on Aging (R01 AG030153, RC2 AG036619, R03 AG043052). For more information, please refer to <https://g2aging.org/>.

SHARE Version and Acknowledgment

This document uses data from SHARE Waves 1-9 release 9.0.0 as of March 2024. The SHARE data collection has been funded by the European Commission through the 5th framework programme (project QLK6-CT-2001-00360 in the thematic programme Quality of Life). Further support by the European Commission through the 6th framework programme (projects SHARE-I3, RII-CT-2006-062193, as an Integrated Infrastructure Initiative, COMPARE, CIT5-CT-2005-028857, as a project in Priority 7, Citizens and Governance in a Knowledge Based Society, and SHARE-LIFE (CIT4-CT-2006-028812)), through the 7th framework programme (SHARE-PREP (No 211909), SHARE-LEAP (No 227822), M4 (No 261982)), and DASISH (No 283646); through Horizon 2020 (SHAREDEV3 (No 676536), SERISS (No 654221), SSHOC (No 823782), SHARE-COHESION (No 870628), SHARE-COVID19 (No 101015924), Rltrain (No 654156) and ERIC Forum (No 823798)) and by DG Employment, Social Affairs & Inclusion through VS 2015/0195, VS 2016/0135, VS 2018/0285, VS2019/0332, VS2020/0313, SHARE-EUCOV: GA No 101052589 and EUCOVII: GA No 101102412 is gratefully acknowledged. Substantial co-funding for add-ons such as the intensive training and retention program for SHARE interviewers and the collection of HRS-harmonised biomarkers was granted by the US National Institute on Aging (U01 AG09740-13S2, P01 AG005842, P01 AG08291, P30 AG12815, R21 AG025169, Y1-AG-4553-01, IAG BSR06-11, OGHA 04-064, BSR12-04, and R01AG052527-02), further funding was granted for the development of a Harmonized Cognitive Assessment Protocol (HCAP) (R01 AG056329-02). Substantial funding for the central coordination of SHARE was received from the German Federal Ministry for Education and Research (Bundesministerium für Bildung und Forschung, BMBF) and the Max Planck Society for the Advancement of Science. See <https://share-eric.eu/infrastructure/funding> for a full list of funding institutions.

What's New in Version G of the Gateway Harmonized SHARE?

Version G incorporates the latest released version of SHARE data, release 9.0.0, and adds observations from Wave 9. It contains 240,025 observations or rows. It is a Respondent-level file so each row represents a unique Respondent. It also adds new variables and makes adjustments and corrections.

We have added the following section to the file:

Housing:

- We added variables indicating the household's type of house, number of rooms, number of floors, number of steps to enter, and whether the household has an elevator, mobility modifications, or lets or sublets any parts of the home.

We have added the following variables to the file:

Demographics, Identifiers, and Weights:

- We added `isoa3`, which is a country-identifier.
- We added `raeducel`, which is a harmonized education variable with additional emphasis on earlier educational attainment.

Health:

- We added `rWnagi10` and `rWnagi8` with coinciding missing and indicator variables for all available waves, which summarize difficulties with mobility items.
- We added `rWflusht1y`, `rWmammog`, and `rWcoloncr` for all available waves, which provide information on the receipt of preventive care.
- We added `rWglasses` for all available waves, which indicates whether the respondent wears glasses, contacts, or corrective lenses.
- We added `rWdenture`, indicating whether the respondent used dentures for Waves 1 and 2, `rWdenture_s`, indicating whether the respondent used dentures, implants, or bridges for Wave 5, and `rWnoteeth`, indicating whether the respondent has no natural teeth remaining for Wave 5.

Cognition:

- We added several variables indicating the respondent's performance in various cognitive exercises and a comparison of their cognitive abilities that were added to SHARE in Wave 8: `rWdrawinf`, `rWdrawcube`, `rWdrawcl`, `rWbwc20`, `rWscis`, `rWcact`, `rWpharm`, and `rWprmem`.
- We added several variables indicating a proxy's rating of the respondent's cognitive abilities and status: `rWprmem`, `rWprchmem`, `rWciqscore1s`, `rWciqscore2s`, `rWciqscore3s`, `rWciqscore5s`, `rWciqscore10s`, `rWciqscore13s`, `rWciqscore14s`, `rWlost`, `rWwander`, `rWalone`, and `rWhaluc`.

Family Structure:

- We added variables indicating monthly contact with children and parents: `hWkcnt1m` and `hWpcnt1m`.

Retirement and Expectations:

-
- We added **rWretage**, indicating the age of the respondent at the time of their retirement..

Assistance and Caregiving:

- We added variables indicating personal care given to the respondent's spouse, children, grandchildren, parents, relatives, non-relatives, or to anyone: **rWgascare**, **rWgaccare**, **rWgakcare**, **rWgapcare**, **rWgarcare**, **rWgafcare**, and **rWgacare**.
- We added variables indicating practical household help or help with paperwork given to the respondent's spouse, children, grandchildren, parents, relatives, non-relatives, or to anyone: **rWgschore**, **rWgcchore**, **rWgkchore**, **rWgpchore**, **rWgrchore**, **rWgfchore**, and **rWgchore**.

Childhood:

- We added **radadeducel** and **ramomeducel**, which are harmonized education variables for the respondent's father and mother with additional emphasis on earlier educational attainment.

Psychosocial:

- We added **rWsatlife_s**, indicating the respondent's rating of their life satisfaction.
- We added individual variables indicating how often the respondent felt a particular statement related to their quality of life applied to them, as well as summary variables related to a control index, autonomy index, pleasure index, self-realization index, and 12-item CASP total score.
- We added variables indicating the day of the week yesterday, **rWdrday**, and whether it was a normal or unusual day, **rWdrnrmlday**, as part of a day reconstruction.
- We added variables indicating the respondent's overall experienced well-being yesterday and accompanying summary scores, as part of a day reconstruction.

We have made the following adjustments, improvements, and corrections to the data and documentation:

All Sections:

- We assigned special missing value (.c) for variables in Wave 7 that were not collected for the condensed questionnaire that was given with the SHARELIFE interview, but were collected for the regular questionnaire.

Demographics, Identifiers, and Weights:

- We corrected **inw5sc**, **inw6sc**, and **inw8sc** to assign 1 values for additional countries with self-completion questionnaires.
- We corrected **rWiwstat** for Waves 2-8 to fix the assignment of the following values: 0, 4, 5, 6, and 9.
- We renamed **rarelig_s**, adding the "_s", and reorganized the responses to make it a SHARE-specific measure.

Health:

- We renamed **rWadltot_s** to **rWadltot6**, as well as the accompanying missing and indicator variables, because it was comparable with the 6-item total ADL count in other Harmonized datasets.

-
- We renamed **rWurina16m**, adding the "6m", to clarify the timeframe used in the question.
 - We renamed **rWrxsleep** to **rWslpmed** and **rWrxpain** to **rWpainmed** to clarify that the medications used were not necessarily prescribed medications.

Healthcare Utilization and Insurance:

- We renamed **rWoophmcr1y** to **rWoophcnh1y** to clarify that it included out-of-pocket expenses for home care and nursing homes.
- We adjusted **rWnrshom1y** to assign 1 values and **rWnrstim1y** and **rWnrsnit1y** to assign special missing (.n) values starting in Wave 2 if the respondent was living in a nursing home.
- We adjusted **rWhomcar1y** to assign special missing (.n) values starting in Wave 6 if the respondent was living in a nursing home.
- We adjusted the variables for out-of-pocket expenses and flags in Wave 7 to take special missing (.c) values and -4 values instead of 0 values and 1 values, respectively, if the respondent was not asked these questions because they completed the condensed interview in that wave.
- We corrected the assignment of out-of-pocket imputation flags in Wave 7.

Financial and Housing Wealth:

- We added special missing value (.i) for **hWarles**, **hWahous**, **hWamort**, **hWatotn**, **hWatotb**, **hWatoth**, and for the household-level versions of these variables if the respondent was living in an institution, instead of having the values set to 0.

Family Structure:

- We renamed **rWpcntf** to **rWpcntfr** for comparability with the child contact variable.

Employment History:

- We adjusted **rWjhours** to use special missing value (.p) instead of special missing value (.c) for returning respondents who have not worked continuously since the previous interview.
- We added special missing values (.w) and (.s) to **rWwgihr** and **rWwgiwk** to indicate not currently working and being self-employed, respectively.

Retirement and Expectations:

- We adjusted **rWretyr** to remove the year unemployed respondents last worked.
- We added special missing value (.h) to **rWretyr**, **rWretmon**, **rWretear**, and **rWwork63** starting in Wave 2 for respondents living in nursing homes.

Physical Measures:

- We adjusted **rWwalkflr** to assign other responses a value of 5 instead of 6, and not sure responses a special missing (.d) instead of 5, for consistency with other Harmonized datasets.

-
- We added special missing value (.p) for physical measures tests in Waves 1, 2, and 4 when the tests were not completed due to proxy interviews.
 - We added additional special missing (.d) and (.r) values for the grip strength variables.

Assistance and Caregiving:

- We renamed **rWgcaany** to **rWgcare** as part of an ongoing effort to clarify the types of care the respondent provides to others, and removed watching grandchildren from its components.
- We changed special missing value (.c) to (.q) for formal care variables that were not asked in specific countries in Wave 1.

Stress:

- We reverse-coded the following variables so that higher values indicate higher levels of job-related stress: **rWsatjob**, **rWdeserve**, **rWsalary**, **rWnskills**, and **rWsupport**.
- We adjusted how we define working for the job satisfaction variables, resulting in fewer special missing (.w) values and more special missing (.d), (.r), and (.m) values. We also added special missing value (.n) starting in Wave 2 if the respondent was not asked these questions because they were living in a nursing home, and special missing value (.b) starting in Wave 5 if the respondent was not asked these questions in their baseline interview.
- We added special missing value (.f) to **r41nlys3** to indicate not completing the self-completion questionnaire.

Childhood:

- We renamed **ramaoccup_s**, adding the "_s", because it does not use the same categories as other studies.

1. Introduction and Overview

This report documents the Gateway Harmonized SHARE data files, a streamlined collection of variables derived from the Survey of Health, Ageing, and Retirement in Europe (SHARE). SHARE is a cross-national panel survey of individuals over age 50 and their spouses or partners in a growing number of countries in continental Europe. Its main goal is to provide panel data that enables research and analysis in support of policies on retirement, health insurance, saving, and economic well-being. The survey elicits information about demographics, income, assets, health, cognition, family structure and connections, health care use and costs, housing, job status and history, expectations, and insurance.

SHARE is sponsored by the European Commission, national funding agencies, and the (U.S.) National Institute of Aging (NIA), is administered by national survey agencies and universities, and is coordinated by the SHARE BERLIN Institute, and previously by the Munich Center for the Economics of Aging (MEA). The first wave was conducted in 2004-2005. This sampled individuals born in 1954 or earlier. In addition to respondents from eligible birth years, the survey interviewed respondents' spouses or partners regardless of age.

The data include any individual interviewed at least once. This includes individuals who were age-eligible (born in eligible years) at the time of their first interview, spouses who were not age-eligible at baseline, and spouses who married an age-eligible respondent between survey waves.

SHARE uses a multistage stratified sample. Its weighting variables make its data representative of the target populations in constituent countries. The most recent release (as of March 2024) of the SHARE data is release 9.o.o. Currently, Waves 1, 2, 4, 5, 6, 7, 8, and 9 from the core study are available for study. SHARE Wave 3 and a large sample in Wave 7 focused on the life histories of the respondents. Because the questionnaires and variables of these SHARELIFE waves are very different from the core data, we do not include them in this document, except in specified variables. Additionally, the exit interviews from Waves 3 and 7 are used to identify respondents who exited the panel.

Documentation of the SHARE methodology can be found in Börsch-Supan et al. (2008) and Börsch-Supan and Jürges (2005). Documentation of the data can be found in SHARE (2024).

1.1. Gateway to Global Aging Data

The Health and Retirement Study (HRS) has achieved remarkable scientific success, as demonstrated by an impressive number of users, research studies, and publications using it. Its success has generated substantial interest in collecting similar data as population aging has progressed in every region of the world.

The result has been a number of surveys designed to be comparable with the HRS: the Mexican Health & Aging Survey (MHAS), the English Longitudinal Study of Ageing (ELSA), the Survey of Health, Ageing and Retirement in Europe (SHARE), the Costa Rican Longevity and Healthy Aging Study (CRELES), the Korean Longitudinal Study of Aging (KLoSA), the Japanese Study on Aging and Retirement (JSTAR), the Irish Longitudinal Study on Ageing (TILDA), the China Health and Retirement Longitudinal Study (CHARLS), the Brazilian Longitudinal Study of Ageing (ELSI), the Northern Ireland Cohort Longitudinal Study of Ageing (NICOLA), the Chilean Social Protection Survey (SPS), the Malaysia Ageing and Retirement Survey (MARS), and the Longitudinal Aging Study in India (LASI). The overview of this family of surveys, including their research designs, samples, and key domains can be found in Lee, Phillips, and Wilkens (2019).

As these surveys were designed with harmonization as a goal, they provide remarkable opportunities for cross-country studies. The value of comparative analyses, especially the opportunities they offer for learning lessons resulting from policies adopted elsewhere, is widely recognized. Yet there are only a limited number of empirical studies exploiting such opportunities. This is partly due to the difficulty associated with learning multiple surveys and the policies and institutions of each country.

Identifying comparable questions across surveys is the first step toward cross-country analyses. The Gateway to Global Aging Data (Gateway) helps users understand and use these large-scale population surveys on health and retirement. The Gateway includes several tools to facilitate cross-national health and retirement research. It includes a digital library of survey questions for all participating surveys. Its search engine enables users to find relevant survey questions. The Gateway also includes a concordance with information comparing measures within and across surveys over time. Using these tools, researchers can identify all questions related to particular key words or within a domain. The Gateway also includes

population and sub-population estimates for key harmonized variables and present them in graphs and tables that can be downloaded.

The Gateway can be accessed at <https://g2aging.org>. For more information about using the Gateway visit the Help page. For more information about obtaining the Gateway Harmonized SHARE using the Gateway see 'Chapter 4. Distribution and Technical Notes.'

1.2. Units of Observation

We distinguish between three units of observation: individual, couple, and household. A "couple" in this sense means a single individual, or individual with his/her spouse, whatever is applicable. In the first wave of SHARE, once it was determined that there was an age-eligible member of the household, all age-eligible household members and their spouses or partners were eligible for interviewing, regardless of their age. As a result, there are households in the data in which more than one "couple" is interviewed, for example, a husband and wife who were older than 50 and the mother of one of them.

In the HRS, an age-eligible individual is sampled and then this individual and their spouse or partner is interviewed, but no other household members, even if they are age-eligible. Thus, in the HRS, there is usually no distinction between a "couple" and a "household". More precisely, "household" variables in the HRS (and the RAND HRS) are actually "couple" variables. But, as mentioned above, in SHARE, a household may consist of more than one "couple".

In the second wave of SHARE, the refreshment sample was collected in the same way as the HRS, so there are no interviewed household members outside the one age-eligible respondent and their spouse or partner, regardless of their age. However, Wave 1 respondents were still eligible for re-interview in Wave 2, so in Wave 2, we still see households with more than one "couple". Since the fourth wave of SHARE, all waves are similar to the second wave in that only one age-eligible respondent and their spouse or partner in the refreshment sample are interviewed and in the longitudinal sample, all previous respondents are interviewed along with their spouses or partners, regardless of their age.

SHARE provides a limited amount of information about household members who are not interviewed. The coverscreen respondent reports a complete household roster and for each household member, age, sex, marital or partner status, and identity of the spouse or partner are recorded. Only individuals over 50 and their spouses or partners are selected for a subsequent interview. In our files, we do not include non-respondents, and thus, in particular, we do not include the information about household members who were not eligible to be interviewed.

1.3. Data File Structure

The Gateway Harmonized SHARE data are contained in a single file which includes the first, second, fourth, fifth, sixth, seventh, eighth, and ninth waves of SHARE. The data are stored in a 'fat format' where each observation represents one respondent. The unit of observation is the individual. Each individual is uniquely identified by the unique identifier **mergeid**. Households are identified by wave-specific **hhwhhid** where 'W' refers to the specific wave. Couples are identified by wave-specific **hwcoupid** where 'W' refers to the specific wave. It is important to note that unlike the HRS, households in the SHARE can include multiple couples. This file may be merged with other SHARE data using **mergeid**.

1.4. Variable Naming Convention

With few exceptions, variable names in the Gateway Harmonized SHARE Data follow a consistent pattern. The first character indicates whether the variable refers to the reference person ('r'), spouse ('s'), the couple ('h'), or the household ('hh'). The following character indicates the wave to which the variable pertains: 1, 2, 4, 5, 6, 7, 8, 9, or a. The 'a' indicates 'all,' i.e., the variable is not specific to any single wave. An example is **rabyear**, the birth year of the respondent. The remaining characters describe the concept that the variable captures. For example:

Variable **s2hlthlm** captures whether the spouse of the reference person in Wave 2 experiences an impairment or health problem that limits the kind or amount of paid work they can do. The name of the variable does not indicate who provided the information. For example, the spouse's health problem may have been reported by the spouse themselves, or it may have been reported by the reference person as a proxy. The SHARE obtains many variables, particularly on financial and family matters, by proxy.

In the text below, we may refer to variables such as **sWhlthlm** for example, without specifying the wave. This reference points at the group of variables **s1htlthlm**, **s2hlthlm**, **s4hlthlm**, **s5hlthlm**, **s6hlthlm**, **s7hlthlm**, **s8hlthlm**, and **s9hlthlm**.

Variable labels also follow a consistent pattern. The first characters denote the name of the variable, followed by a colon. Then follows the wave to which the variable pertains (W1, W2, W4, W5, W6, W7, W8, or W9). The remainder of the label describes the concept that the variable captures. For example, the variable label of **s2hlthlm** is:

s2hlthlm:w2 S Hlth problems limit work

It may seem duplicative to include the name of the variable and the wave in the variable label. However, Stata often suppresses the variable name and instead uses its label in the presentation of results.

Variable names in the Gateway Harmonized SHARE are generally based on the variable name used in the RAND HRS or the Harmonized HRS for the same measure. Measures which are exactly or near-exactly comparable between the Gateway Harmonized SHARE and RAND HRS or Harmonized HRS use the exact same name. For instance, **rabyear** is the variable name for the respondent's birth year in both the Gateway Harmonized SHARE, as well as the RAND HRS. **rWsatjob** is the variable name for whether the respondent is satisfied with their job in both the Gateway Harmonized SHARE and the Harmonized HRS. If the Gateway Harmonized SHARE measure is deemed only somewhat comparable with the RAND HRS or Harmonized HRS version of that measure, the variable name in the Gateway Harmonized SHARE will often end in **'_s'**. This variable name suffix indicates some SHARE-specific difference with the RAND HRS or Harmonized HRS version of this measure. For instance, the Gateway Harmonized SHARE variable labor force status is named **rWlbrf_s**, while the RAND HRS variable for labor force status is named **rWlbrf**. The reason for this difference in variable name is that the SHARE used a different set of labor force statuses than the HRS. The Gateway Harmonized SHARE variable for having been troubled by a fall is named **rWfall_s**, while the HRS asks whether the respondent has fallen down, so the Harmonized HRS variable is named **rWfall**. The reason for this difference in variable name is the difference in question wording, and thus concepts captured. Other reasons for Gateway Harmonized SHARE-specific variable names include: differences in survey routing, and whether both sets of variables use imputed values. Gateway Harmonized SHARE-specific variable names are used to notify the user that there are substantial differences between the RAND HRS or Harmonized HRS and Gateway Harmonized SHARE measures and clean harmonization between these measures is not possible.

The Gateway Harmonized SHARE includes some variables without Gateway Harmonized SHARE-specific variable names even though the Gateway Harmonized SHARE measure is significantly different from the RAND HRS or Harmonized HRS measure of the same name. In particular, wealth and income measures in the Gateway Harmonized SHARE do not use Gateway Harmonized SHARE-specific variable names even though wealth and income measures in the Gateway Harmonized SHARE are expressed in nominal Euros while income and wealth measures in the RAND HRS are always expressed in nominal dollars. Users should always check the 'Cross-Study Differences with the HRS' section of each measure before comparing any Gateway Harmonized SHARE measure to the RAND HRS or Harmonized HRS version of the same measures or any other Harmonized Dataset version of the same measure.

1.5. Missing Values, Nonresponse, and Imputations

Variables may contain missing values for several reasons. Stata, SAS, and SPSS offer the capability to distinguish multiple types of missing values, and we have attempted to record as much information as possible. Generally, the codes adhere to the classification in Table 1.

Table 1. Missing Codes

Code	Reason for missing
.	Reference person did not respond to this wave
.c	Received condensed questionnaire in Wave 7
.d	Don't know
.m	Other missing
.n	Not assessed
.r	Refused
.u	Reference person is not married (for spouse variables)
.v	Spouse did not respond to this wave (for spouse variables)

The coding scheme varies across variables. Consult the Data Codebook for details on individual variables. Please note that in Wave 7, if the respondent's spouse was given the condensed questionnaire as compared to the full questionnaire, the questions that were skipped for the condensed questionnaire will also be assigned special missing .v in the spouse version of the Harmonized variable.

Item nonresponse for many variables is handled by imputation. The SHARE documentation (SHARE, 2010) gives some information about this and a more detailed description is provided in Christelis (2011). In SHARE, unlike most surveys, the multiple imputations technique is used. For each respondent, 5 records called *implicates*, are available in the imputations file, corresponding to 5 imputations. Of course, for variables for which a valid value is given by the respondent, this same value is used in all 5 records. All the Gateway Harmonized SHARE variables derived from the imputations file only include the first of the 5 available imputations. We ask users wanting to utilize multiple imputations to refer back to the imputation files in the SHARE data.

The correct statistical way to handle multiple imputations is to analyze the data from the 5 *implicates* separately. Thus, one obtains 5 estimates of the parameter of interest and 5 estimates of its variance. The combined estimate is the average of the 5 separate estimates and the estimate of its variance is the average of the 5 variance estimates plus a multiple of the sample variance of the 5 separate parameter estimates. The latter is a correction term that reflects the uncertainty due to imputation, compared to having actual values. The detailed expressions can be found in SHARE (2010, pp. 28-29) and Christelis (2011). In Stata 11 and later versions, this procedure is implemented in the `mi` command, but implementation in earlier Stata versions can also be done straightforwardly.

While SHARE has provided imputed values for many variables, the Gateway Harmonized SHARE provides imputed values for wage rate variables, which are available for Waves 1 and 2. For this imputation, we employ a predictive mean matching imputation method (PMM; Little, 1988) which is also used for the Gateway Harmonized SHARE End of Life imputed variables and for imputed variables in other Harmonized datasets. The Harmonized PMM method uses all reported values and estimates a linear regression model for the inverse hyperbolic sine of this value with a small set of covariates. The imputed value is the reported value of the individual with the closest predicted value, where the donor pool consists of individuals who reported a value that is consistent with the reported information from the individual that needs imputation. For instance, if a respondent reported receiving between 1,100 and 2,100 Euros per month in take home pay in the unfolding bracket sequence, the donor pool would consist of other individuals who reported a take home pay between 1,100 and 2,100. As part of the Harmonized imputation process, imputation flag variables are also created, which allow data users to know whether the value was reported or imputed and, if imputed, what information was known (regarding receipt and bracket values). For the wage rate imputations in the Gateway Harmonized SHARE, the age and the gender of the individual are used as covariates and imputations are performed separately for each country. For more information about this PMM model refer to Lee, Meijer, and Phillips (2015).

2. Wealth and Income Variables

2.1. Units of Observation, Financial and Household Respondent

It is important to distinguish the unit of observation for SHARE wealth and income measures because financial questions can be asked about the individual, the individual and a spouse, and all household respondents and their spouses. In SHARE Wave 1, all age-eligible household members and their spouses or partners, regardless of their age, were eligible for interviewing. In Wave 2, for re-interview households, SHARE interviewed all household respondents who were previously interviewed in Wave 1 and their spouses or partners, regardless of their age. However, in Wave 2 the refreshment sample was collected differently. For households in the refreshment sample, SHARE only interviewed one age-eligible respondent and their spouse or partner, regardless of their age. In Wave 4, for re-interview households, SHARE interviewed all household respondents who were previously interviewed and their spouses or partners, regardless of their age. Since Wave 4, for households in the refreshment sample, SHARE only interviewed one age-eligible respondent and their spouse or partner, regardless of their age. SHARE does not impute values for non-responding spouses for any wave, so couple-level and household-level financial variables for these waves only include information for responding spouses.

For married or cohabiting couples, SHARE Wave 1 asked asset questions (and asset income questions) at the individual level or at the couple level, depending on whether the spouses kept their finances separate or together. If finances were kept together, one spouse was designated as the financial respondent, who answered the asset questions for the couple. Individual retirement accounts (IRAs) were treated slightly differently, because for these, separate amounts for both spouses were always asked. If spouses kept finances together and thus there was only one financial respondent, this respondent reported separate amounts for their own IRAs and the IRAs of their spouse. In Wave 2 and forward, the option of reporting assets separately was not offered, and all couples were asked to designate a financial respondent who answered the asset questions. This way of asking corresponds with the couples that keep finances together in Wave 1. This is also how the HRS asks asset questions.

Some asset variables, namely, value of the house, mortgages or loans on the house, and other real estate, are asked of the household respondent. This is the respondent deemed most knowledgeable about housing and household finances. Note that it is a requirement that this individual is a respondent and thus must be otherwise eligible for interview, that is, be 50 years or older or the spouse or partner of someone 50 or older. Asset components that are only asked of the household respondent are thus only available for the household respondent and their spouse or partner, if any.

For harmonization purposes, we need to use the same unit of observation in the different harmonized data sets, and because the HRS does not have information on wealth and income of household members outside the couple and does not have individual-level asset information, the unit of observation is the individual for certain income variables (earnings, pensions, and benefits) and the couple-level and household-level for other income variables (e.g. asset income) and wealth variables. Thus, in constructing our couple-level variables, we ignore income and wealth from household members outside the couple. These couple-level variables can be compared to the RAND HRS income and wealth household measures. We also construct income and wealth variables for researchers wanting to consider the income and wealth of the entire household. Because of the ways particular income and wealth questions are asked in the SHARE, certain values are only available at the couple-level or at the household-level. For example, the value of other real estate is asked in the housing (HO) section, which is asked of the household respondent on behalf of the whole household, so for households with a couple and other individuals or couples it is not possible to derive a couple-level value. Therefore, we set the values of couple-level asset variables based on the housing module to missing for couples with other individuals or couples in their household.

The Wave 1 imputations file provides asset and income variables at both the individual and the household level. Given our emphasis on harmonization, we combine the individual-level asset and income variables into couple-level variables for those variables for which the RAND HRS provides couple-level variables. The Waves 2, 4, 5, 6, 7, 8, and 9 imputations files provide most asset variables and some income variables (such as asset income) only at the household level. For households in which the "household" and the "couple" do not coincide, we are not able to construct the couple-level variables and thus set these to missing. This applies to slightly over 1% of the respondents. There are some exceptions, where we would be able to construct couple-level variables. For example, if the household does not own the asset, the couple does not own it either, and if no imputation was necessary, we would be able to construct the couple-level variable from the answers provided in the raw AS module data file. We will consider these improvements in subsequent versions.

The SHARE imputation files do not include component-level imputations for non-responding spouses. Therefore, we set the values of couple-level income variables to missing for respondents with a non-responding spouse. Likewise, we set the values of household-level income variables to missing for respondents whose household includes a respondent with a non-responding spouse. SHARE does provide an indirect estimate of the income from non-responding spouses in the SHARE imputation files but this estimate is not currently included in any of the couple or household-level income variables in the Gateway Harmonized SHARE.

2.2. Currencies, timing, and exchange rates

The SHARE survey uses several types of currency for monetary variables. In Wave 1, for countries that adopted the Euro (which became physical currency in January 2002), respondents were given the option of giving amounts in Euros or in their country's pre-Euro currency. In countries that have not (or had not yet at the time of interview) adopted the Euro, respondents gave amounts in their local currency. In Wave 2 and forward, respondents in Euro countries had to report amounts in Euros. In the SHARE data files of the CAPI modules, these amounts have all been converted to Euros, using a fixed nominal exchange rate per country, i.e., an exchange rate not varying with the time of interview. This exchange rate is available in the SHARE imputations data file in the variable **nomxCAP1**. Also in all waves of the SHARE imputation files, all financial amounts are given in Euros. The derived financial variables in the Gateway Harmonized SHARE are based on the variables in the imputations file, thus all Gateway Harmonized SHARE financial variables are denominated in Euros. These currency conversions are performed using the exchange rate to Euros for the year the question referred to as provided by SHARE in the **nomxCAP1** variables.

Some asset questions ask about asset values "at the end of 2003" for interviews conducted in 2004 (and more generally, "at the end of [last calendar year]"), whereas other asset questions ask about current asset values. Furthermore, even though some amounts are asked "at the end of 2003", the corresponding ownership questions (which precede the amounts) are asked for the time of the interview.

If we would take this timing literally, this would lead to a large number of missing values. For the "end of 2003" questions, we know the asset values at the end of 2003 if the respondent indicated owning the asset now, but we don't know the asset value at the time of interview. Conversely, if the respondent indicated not owning the asset at the time of interview, we know that their current asset value is zero, but we can't be sure that they didn't own the asset at the end of 2003. Moreover, we cannot compute net worth (at any point in time) for anyone in the sample due to this timing discrepancy. For example, if someone had 1 million in a bank account at the end of 2003 and 1 million in debt, and paid off the debt with the money in the bank account between the end of 2003 and the interview date, and answered the questions corresponding to how they were asked, the data would tell us that this person has 1 million in a bank account and no debt, giving rise to a net value of 1 million, whereas in fact, both before and after paying off the debt, the net value of these two items was zero.

To resolve this problem, we make the assumption that asset values have not significantly changed between the end of 2003 and the interview date, and thus we treat all asset values as if they ask about the values of assets at the same time. This allows us to compute aggregate wealth values. The assumption is probably true for most respondents, but there will be some respondents for whom this is not true. Thus, there is some measurement error associated with it.

Income questions generally ask for the average monthly income in the last calendar year (2003, if the interview was conducted in 2004).

3. Structure of Codebook

The Data Codebook contains the codebook documenting all variables in the Gateway Harmonized SHARE Data. This section explains how to interpret the codebook entries. The figure below shows a typical codebook page; the numbers in blue correspond to comments below.

1

Health Care Utilization: Hospital				
Variable	Waves	Label	Type	
rWhosp1y	1-2, 4-9	rWhosp1y:ww R Hospital stay, pr 12 mos	Categ	
sWhosp1y	1-2, 4-9	sWhosp1y:ww S Hospital stay, pr 12 mos	Categ	
rWhsptim1y	1-2, 4-9	rWhsptim1y:ww R # Hospital stays, pr 12 mos	Cont	
sWhsptim1y	1-2, 4-9	sWhsptim1y:ww S # Hospital stays, pr 12 mos	Cont	
rWhspnit1y	1-2, 4-9	rWhspnit1y:ww R # Nights in hosp, pr 12 mos	Cont	
sWhspnit1y	1-2, 4-9	sWhspnit1y:ww S # Nights in hosp, pr 12 mos	Cont	

3

How Constructed

rWhosp1y indicates whether the respondent reports any overnight hospital stay in the last 12 months. If the respondent reports any overnight hospital stay, **rWhsptim1y** is the reported number of stays from 1 to 10 and **rWhspnit1y** is the reported number of nights over all stays from 1 to 365. **rWhsptim1y** and **rWhspnit1y** are set to 0 if the respondent reports no overnight hospital stay in the last 12 months. Don't know, refuse, and other missing responses to **rWhosp1y**, **rWhsptim1y**, and **rWhspnit1y** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWhosp1y, **sWhsptim1y**, and **sWhspnit1y** give this information for the respondent's spouse or partner and are taken directly from the respondent's spouse's values to **rWhosp1y**, **rWhsptim1y**, and **rWhspnit1y**. In addition to the special missing codes used in **rWhosp1y**, **rWhsptim1y**, and **rWhspnit1y**, **sWhosp1y**, **sWhsptim1y**, and **sWhspnit1y** employ the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

4

Cross Wave Differences in SHARE

No differences known.

5

Cross-Study Differences with the HRS

In SHARE, the reference period is 12 months. In RAND HRS, the reference period is since last interview or last 2 years for most of the waves.

6

Original SHARE Variables Used

Wave 1:

hco12_ Stayed over night in hospital last 12 months
hco13_ Times being patient in hospital
hco14_ Total nights stayed in hospital

Wave 2:

hco12_ Stayed over night in hospital last 12 months
hco13_ Times being patient in hospital
hco14_ Total nights stayed in hospital

Wave 4:

hco12_ Stayed over night in hospital last 12 months
hco13_ Times being patient in hospital
hco14_ Total nights stayed in hospital

Wave 5:

hco12_ Stayed over night in hospital last 12 months
hco13_ Times being patient in hospital
hco14_ Total nights stayed in hospital

Wave 6:

hco12_ Stayed over night in hospital last 12 months
hco13_ Times being patient in hospital
hco14_ Total nights stayed in hospital

Wave 7:

hco12_ Stayed over night in hospital last 12 months
hco13_ Times being patient in hospital
hco14_ Total nights stayed in hospital

Wave 8:

hco12_ Stayed over night in hospital last 12 months
hco13_ Times being patient in hospital
hco14_ Total nights stayed in hospital

Wave 9:

hco12_	Stayed over night in hospital last 12 months
hco13_	Times being patient in hospital
hco14_	Total nights stayed in hospital

- 1** **Title:** The variables are documented in groups according to the concept that they measure. For example, there are sixteen variables related to any hospital stays, corresponding to eight waves and respondent/spouse.
- 2** **Variable Overview:** This entry overviews the provided variables in this group. The table includes the names of variables with a "W" in place of individual wave numbers. The wave column displays the waves for which this variable is built or a "All" in the case of variable which is not wave-specific (e.g. birth y ear). Variable labels are also included which typically include the name of the variable and a short description. Lastly, the Type column indicates the variable type, which may be continuous (Cont), categorical (Categ), or character (Char).
- 3** **How Constructed:** This entry provides background on the manner in which variables were constructed.
- 4** **Cross-Wave Differences in SHARE:** This entry briefly describes differences in question wording or contents between interview waves.
- 5** **Cross-Study Differences with the HRS:** This entry describes any differences between the RAND HRS or Harmonized HRS version of the variable and the Gateway Harmonized SHARE version of the variable. It is imperative these differences are understood when using harmonized measures.
- 6** **Continuous Variable Distributions:** This entry shows descriptive statistics of each continuous variable. They include the number of nonmissing values, the mean, standard deviation, minimum value, maximum value, and number of missing values in the wave.
- 7** **Categorical Variable Frequencies:** This entry shows the value label codes. These are only relevant for categorical variables. The first character(s) of the value labels indicate the value to which each label has been assigned. For example, value '1' is mapped into '1. Yes' (not just 'Yes'). The entry also indicates which labels are assigned to which variables, and shows frequency tabulations for all categorical variables.
- 8** **Original SHARE Variables Used:** This entry provides the names and labels of raw SHARE variables that were used to construct the new variables.

4. Distribution and Technical Notes

The Gateway Harmonized SHARE Data file is distributed through the SHARE website along with the original SHARE data. The Gateway Harmonized SHARE data file is made available free of charge but only to users who register with the SHARE and agree to the standard conditions. For more information on obtaining access to the SHARE data, visit: <https://share-eric.eu/data/data-access>.

The Gateway Harmonized SHARE is distributed in Stata, SPSS, and R dataset formats.

This is version **G** using release 9.0.0 of the Gateway Harmonized SHARE Data.

A copy of this Gateway Harmonized SHARE Codebook can be obtained on the Gateway to Global Aging Data under the Harmonized Data and Get Data tabs (<https://g2aging.org/hrd/get-data>).

5. Data Codebook

A. Demographics, Identifiers, and Weights

Person Specific Identifier			
Variable	Waves	Label	Type
hhid	All	hhid: household id /6-char	Char
pn	All	pn: Person number within household (char)	Char
mergeid	All	Person identifier (fix across modules and waves)	Char

How Constructed

SHARE provides a unique identifier for each respondent across waves, **mergeid**. It consists of three separate parts:

cid, a two character country/language survey code derived from the first part of **mergeid**. These two characters are different from COUNTRY because three countries, Switzerland, Belgium, and Israel, use a different **cid** for each survey language. The values are as follows: 11.Austria, 12.Germany, 13.Sweden, 14.Netherlands, 15.Spain, 16.Italy, 17.France, 18.Denmark, 19.Greece, 20.Switzerland (German), 21.Switzerland (French), 22.Switzerland (Italian), 23.Belgium (French), 24.Belgium (Flemish), 25.Israel (Hebrew), 26.Israel (Arabic), 27.Israel (Russian), 28.Czech Republic, 29.Poland, 30.Ireland, 31.Luxembourg, 32.Hungary, 33.Portugal, 34.Slovenia, 35.Estonia, 47.Croatia, 48.Lithuania, 51.Bulgaria, 53.Cyprus, 55.Finland, 57.Latvia, 59.Malta, 61.Romania, and 63.Slovakia.

hhid is a 6 character household identifier used in SHARE to indicate the household to which a sample participant belonged when entering the panel. Note that **hhid** is different from SHARE's wave-specific household identifier HHIDw, which indicates the household where the respondent resides in a particular wave w.

pn is the 2 digit respondent identifier used by SHARE to indicate each participant within the household.

mergeid is SHARE's 12 character unique and non-changing identifier across waves. **mergeid** is formed as **cid-hhid-pn**. For example, if a respondent is from Austria and has a **cid** of 11, is in a household with **hhid** 123456, and has a **pn** of 02 inside the household, their **mergeid** would be "11-123456-02".

mergeid is used for all merges between waves since it is the only identifier that tracks respondents across waves. **mergeid** is a SHARE specific identifier and can be used for merging additional information from SHARE.

Cross Wave Differences in SHARE

Starting in Wave 5, SHARE began specifying whether surveys in Spain/Girona were conducted in Catalan or Castilian, surveys in Luxembourg were conducted in French or German, and surveys in Estonia were conducted in Estonian or Russian.

Cross-Study Differences with the HRS

No differences known.

hhid7	7	hhid7: SHARE household identifier wave W	Char
hhid8	8	hhid8: SHARE household identifier wave W	Char
hhid9	9	hhid9: SHARE household identifier wave W	Char

How Constructed

hhWhhid is a numeric version of the household identifier used by SHARE. **hhWhhid** uniquely identifies a household in a given wave. **hhWhhid** consists of **cid** + **hhid** + a subhousehold identifier. Subhouseholds in SHARE identify split households, that is, those households formed by panel members who moved out of a previous household. SHARE specifically codes subhouseholds using letters, with "A" given to original households and subsequent letters to split households. To create a numeric version of the household identifier, subhouseholds are coded according to their alphabetical positions, e.g. A=1, B=2, etc. Thus, if a respondent is from Austria and has a **cid** of 11, is in a household with **hhid** 123456, and in the second wave is in subhousehold A, their H2HHID would be "111234561".

hhWhhidc is a 9 digit character version of **hhWhhid**. **hhWhhidc** is created using exactly the same standards as **hhWhhid** but is stored as a character.

hhidW is the SHARE household identifier. **hhidW** is an 11 character variable consisting of **cid-hhid**—a subhousehold identifier. For example, if a respondent is from Austria and has a **cid** of 11, is in a household with **hhid** 123456, and in the second wave is in subhousehold A, their HHID2 would be "11-123456-A".

hhWhhid, **hhWhhidc**, and **hhidW** may change across waves, hence none of these variables should be used to merge between different waves of data. **hhidW** is a SHARE specific variable and can be used for merging additional wave-specific data from SHARE.

Cross Wave Differences in SHARE

In SHARE Wave 1, the survey was conducted with "all individuals born in 1954 or earlier [...] and their spouses/partners independent of age." Accordingly, there are households which contain a couple and other uncoupled individuals or households with two or more uncoupled individuals. In SHARE Wave 2, follow-up interviews were conducted with all persons interviewed in Wave 1 and their spouses/partners. SHARE used a different eligibility though for households in the Wave 2 refresher sample. SHARE Wave 2 was only conducted on one age-eligible individual and their spouse/partner for households in the refresher sample. SHARE Wave 3 (SHARELIFE) was conducted on all SHARE respondents who participated in Wave 1 or Wave 2 and their current partners/spouses. Ex-spouses of respondents who participated in Wave 1 or Wave 2 were only given the SHARELIFE interview if they were 50 years or older at the time of data collection in Wave 1 or Wave 2. SHARE Wave 4 eligibility was most similar to SHARE Wave 1 eligibility where baseline interviews (for the refreshment sample and new countries) were conducted with "all persons born 1960 or earlier [...] together with their current partners/spouses, independent of age." Baseline interviews were conducted with all persons born in 1962 or earlier for Wave 5, in 1964 or earlier for Wave 6, in 1966 or earlier for Wave 7 and SHARELIFE, in 1969 or earlier for Wave 8, and in 1971 or earlier for Wave 9. In all waves, the selected respondent was interviewed together with their current partner/spouse regardless of age. Starting in Wave 4, follow-up interviews were conducted with all individuals who were interviewed in any previous wave and their current partners/spouses. Given changing eligibility, the SHARE definition of a household can contain multiple single people

and/or multiple couples, unlike the HRS definition of a household which is always one single person or a couple. The use of a couple ID is imperative for identifying sub-households and for comparison to the HRS concept of a household.

Cross-Study Differences with the HRS

The SHARE eligibility is different from HRS eligibility, in which only one respondent and their spouse are interviewed.

Continuous Variable Distributions

Variable	N	Mean	Std.Dev	Minimum	Maximum	Total missing

isocountry	All	UN numerical country code	Categ
isoa3	All	isoa3: Country indicator	Char

How Constructed

country is the SHARE country identifier. **country** is a 2-digit code ranging from 11 to 63 which represents the country in which the respondent was surveyed. The codes are mapped as follows: 11.Austria, 12.Germany, 13.Sweden, 14.Netherlands, 15.Spain, 16.Italy, 17.France, 18.Denmark, 19.Greece, 20. Switzerland, 23.Belgium, 25.Israel, 28.Czech Republic, 29.Poland, 30.Ireland, 31.Luxembourg, 32.Hungary, 33.Portugal, 34.Slovenia, 35.Estonia, 43.Slovenia, 47.Croatia, 48.Lithuania, 51.Bulgaria, 53.Cyprus, 55.Finland, 57.Latvia, 59.Malta, 61.Romania, and 63.Slovakia. **country** is helpful for a variety of purposes because the survey questionnaires varied among the countries that participated in SHARE.

isocountry is a modified version of the SHARE variable **country**. Using ISO 3166-1 (numeric-3) codes, **isocountry** indicates the country in which surveying took place. The codes are mapped as follows: 40.Austria, 56.Belgium, 100.Bulgaria, 191.Croatia, 196.Cyprus, 203.Czech Republic, 208.Denmark, 233.Estonia, 246.Finland, 250.France, 276.Germany, 300.Greece, 348.Hungary, 372.Ireland, 376.Israel, 380.Italy, 428.Latvia, 440.Lithuania, 442.Luxembourg, 470.Malta, 528.Netherlands, 616.Poland, 620.Portugal, 642.Romania, 703.Slovakia, 705.Slovenia, 724.Spain, 752.Sweden, and 756.Switzerland. **isocountry** is helpful for matching respondents to country-level statistics where countries are often identified using ISO codes.

isoa3 are three-letter country codes which indicate the country in which surveying took place. The codes are mapped as follows: AUT-Austria, BEL-Belgium, BGR-Bulgaria, HRV-Croatia, CYP-Cyprus, CZE-Czech Republic, DNK-Denmark, EST-Estonia, FIN-Finland, FRA-France, DEU-Germany, GRC-Greece, HUN-Hungary, IRL-Ireland, ISR-Israel, ITA-Italy, LVA-Latvia, LTU-Lithuania, LUX-Luxembourg, MLT-Malta, NLD-Netherlands, POL-Poland, PRT-Portugal, ROU-Romania, SVK-Slovakia, SVN-Slovenia, ESP-Spain, SWE-Sweden, and CHE-Switzerland. **isoa3** is helpful for matching respondents to country-level statistics where countries are often identified using ISO codes.

Cross Wave Differences in SHARE

The Czech Republic, Poland, and Ireland were added in Wave 2. Hungary, Portugal, Slovenia and Estonia were added in Wave 4. Luxembourg was added in Wave 5. Croatia was added in Wave 6. Bulgaria, Cyprus, Finland, Latvia, Lithuania, Malta, Romania and Slovakia were added in Wave 7.

Cross-Study Differences with the HRS

Only the US is part of the HRS, whereas the above listed countries are participants in the SHARE survey.

Tracker and Weights:

country

Country identifier

Language of Interview			
Variable	Waves	Label	Type
rWlang_s	1-9	rWlang_s:WW r language of interview	Categ
sWlang_s	1-9	sWlang_s:WW s language of interview	Categ

How Constructed

rWlang_s indicates the language used for the interview. **rWlang_s** is coded as follows: 1.German, 2.Swedish, 3.Dutch, 4.Spanish, 5.Italian, 6.French, 7.Danish, 8.Greek, 9.Flemish, 10.Hebrew, 11.Arabic, 12.Russian, 13.Czech, 14.Polish, 15.English, 16.Hungarian, 17.Portuguese, 18.Slovenian, 19.Estonian, 20.Catalan, 21.Croatian, 22.Luxembourgian, French, German, or Portuguese, 23.Estonian or Russian, 24.Spanish or Catalan, 25.French or German, 26.French, German, or Portuguese, 27.Lithuanian, 28. Bulgarian, 29. Finnish, 30. Latvian, 31. Maltese, 32. Romanian, 33. Slovakian. **rWlang_s** is set to plain missing (.) for respondents who did not respond to the current wave.

sWlang_s indicates the language used for the respondent's current wave's spouse's interview. It is taken from the spouse's **rWlang_s**. In addition to the special missing codes used for **rWlang_s**, **sWlang_s** employs two other special missing codes, (.u) and (.v). If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

Starting in Wave 5, SHARE began specifying whether surveys in Spain/Girona were conducted in Catalan or Castilian, surveys in Luxembourg were conducted in French or German, and surveys in Estonia were conducted in Estonian or Russian.

Cross-Study Differences with the HRS

A language variable is included as part of the Harmonized HRS. The HRS allows interviews in English and Spanish.

Implicate Used for Imputations

Variable	Waves	Label	Type
<code>implicat</code>	All	implicat: implicate number	Cont

How Constructed

`implicat` is a SHARE defined variable which indicates which implicate was used for imputations. SHARE uses a Multiple Imputation method for missing values which is explained in detail in Dimitris Christelis' "Imputations of Missing Data in Waves 1 and 2 of SHARE", available on share-eric.eu.

The Gateway Harmonized SHARE dataset includes implicate 1 values for all imputed values.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

The HRS does not employ a Multiple Imputation method.

Couple Identifier

Variable	Waves	Label	Type
hWcoupid	1	Wave_1 specific couple id number /num	Cont
hWcoupid	2	Wave_2 specific couple id number /num	Cont
hWcoupid	3	Wave_3 specific couple id number /num	Cont
hWcoupid	4	Wave_4 specific couple id number /num	Cont
hWcoupid	5	Wave_5 specific couple id number /num	Cont
hWcoupid	6	Wave_6 specific couple id number /num	Cont
hWcoupid	7	Wave_7 specific couple id number /num	Cont
hWcoupid	8	Wave_8 specific couple id number /num	Cont
hWcoupid	9	Wave_9 specific couple id number /num	Cont
hWcoupidc	1-9	wave W specific couple id number /5-char	Char

How Constructed

hWcoupid is a numeric variable that identifies couples in a given wave. **hWcoupidc** is the character version of the numeric couple identifier, with leading zeros. For example, if the couple identifier is 01234 then **hWcoupid** is 1234 and **hWcoupidc** is "01234".

Every respondent to a given wave is assigned a couple id. SHARE assigns each individual in the household a coverscreen id and records the coverscreen id of their spouse. Couples are determined by matching the coverscreen IDs of partnered individuals in the same household. For example, suppose that in Wave 1 a household consists of 3 people: person 1, person 2, and person 3. If person 1 is reported as being coupled with person 2, and person 2 is reported as being coupled with person 1, then person 1 and 2 would have a matching **hWcoupid** and person 3 would have a different **hWcoupid**. **hWcoupid** and **hWcoupidc** are set to plain missing (.) if the respondent did not respond to the particular wave.

The **hWcoupid** and **hWcoupidc** variables are used to identify all spouse data.

hWcoupid and **hWcoupidc** are not unique identifiers across waves as the couple number changes in every wave of the SHARE. Neither of these variables should be used for merging.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

Unlike the HRS, SHARE was initially conducted on any eligible individuals present at the household during the time of the interview. In this regard, there are households which contain a couple and an uncoupled individual or households which contain two couples. The use of couple id is imperative for identifying subhouseholds and for comparison to the RAND HRS concept of household.

Spouse Identifier

Variable	Waves	Label	Type
sWmergeid	1-9	sWmergeid:ww spouse mergeid /12-char	Char
raspct	All	raspct: # of spouses with mergeid	Cont
raspid1	All	raspid1: mergeid of 1st spouse	Char
raspid2	All	raspid2: mergeid of 2nd spouse	Char
raspid3	All	raspid3: mergeid of 3rd spouse	Char
raspid4	All	raspid4: mergeid of 4th spouse	Char

How Constructed

sWmergeid is the **mergeid** of the respondent's spouse in a particular wave as identified by the **hWcupid**.

Because **hWcupid** does not directly correspond to marriage status, there are a number of individuals who are counted as a couple even though one or both individuals report themselves as being unmarried. These cases of unmarried but coupled individuals can best be thought of as cohabiting partners who are also counted as spouses in the RAND HRS.

raspct records how many spouses R has over all waves. Each spouse's **sWmergeid** is recorded in **raspid1-raspid4**. Up to 4 spouses' unique IDs are currently recorded. These are numeric versions of the unique **mergeid** provided by SHARE.

If there is no spouse in a given wave, **sWmergeid** is set to zero. If R did not respond in a given wave, **sWmergeid** is set to plain missing (.).

Following the RAND HRS, the Gateway Harmonized SHARE contains spouse versions of many variables. Spouse variables are generated for the spouse in each wave as identified by **hWcupid**. For example, **s1bdate** and **s2bdate** are the birth dates for the Wave 1 and Wave 2 spouses, respectively. If the spouse in Wave 1 is the same as the spouse in Wave 2, these dates are identical. If the spouse in Wave 1 is different from the spouse in Wave 2, these may be different dates. If these spouse variables are missing because R is single, they are set to a special missing (.u). If they are missing because R's spouse was not present for the interview, they are set to a special missing (.v).

Wave Status

Variable	Waves	Label	Type
inwW	1-2, 4-9	inwW: =1 if respondent wW	Categ
inwWsc	1-2, 4-9	inwWsc: =1 if respondent wW drop-off	Categ
inwWlh	3, 7	inwWlh: =1 if respondent wW life history	Categ
inwWc	7	inwWc: =1 if respondent wW condensed version	Categ

How Constructed

inwW indicates whether an individual responded to a particular wave. **inwW** is derived from the interview_wW variable in the SHARE tracker file. Respondents identified as having either a full or partial interview either in person or through a proxy are considered to have responded.

inwWsc indicates whether an individual responded to a particular wave's drop-off/self-completion questionnaire. A code of 0 indicates the respondent is not included in the SHARE drop-off/self-completion questionnaire file for that wave. A code of 1 indicates that the respondent at least partially completed the drop-off/self-completion questionnaire and is included in drop-off/self-completion questionnaire file. **inwWsc** is assigned plain missing (.) if the respondent did not participate in the current wave.

inwWlh indicates whether an individual responded to a particular wave's life history questionnaire. A code of 0 indicates the respondent is not included in the SHARELIFE life history questionnaire file. A code of 1 indicates that the respondent at least partially completed the life history questionnaire and is included in life history questionnaire file. The life history questionnaire was given in Wave 3 and Wave 7. Those respondents who did not respond to the Wave 3 SHARELIFE life history questionnaire were given the life history questionnaire in Wave 7 and those who participated in the SHARELIFE questionnaire in Wave 3 were given the full core questionnaire in Wave 7.

inw7c indicates whether an individual responded to the Wave 7 condensed questionnaire. A code of 0 indicates the respondent was not given or did not complete the SHARE Wave 7 condensed questionnaire file. A code of 1 indicates that the respondent was given and at least partially completed a condensed version of the Wave 7 questionnaire. At Wave 7, respondents who completed the SHARELIFE questionnaire were given a condensed version of the SHARE questionnaire, which covered a portion of the questions of the regular SHARE questionnaire.

Cross Wave Differences in SHARE

The drop-off/self-completion questionnaire changed significantly over the years. In Waves 1 and 2, the questionnaire included questions on mental and physical health, health care and social networks. Israel also had an additional set of questions in its drop-off/self-completion questionnaire which were specific to Israel. In Wave 4, the drop-off/self-completion questionnaire included questions on health and health care and a number of country-specific questions. In Wave 5, the drop-off/self-completion questionnaire only includes country-specific questions for Austria, the Czech Republic, and Israel. In Wave 6, the drop-off/self-completion questionnaire only includes country-specific questions for Austria, Czech Republic, Germany, Israel, and Slovenia. In Wave 7, the drop-off/self-completion questionnaire only includes country-specific questions for Austria, Czech Republic, Estonia, Finland, Israel, Slovenia and Switzerland. In Wave 8, the drop-off/self-completion questionnaire includes country-specific questions for Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Israel, Italy, Luxembourg, Poland, Romania, Slovenia, Spain, and Switzerland. In Wave 9, the drop-off/self-completion questionnaire includes country-specific questions for Austria, Belgium, Estonia, Finland, France, Germany, Greece, Israel, Latvia, Luxembourg, Poland, Romania, Slovenia, and Switzerland.

There was no drop-off/self-completion questionnaire in Wave 3.

In both Waves 1 and 2, a portion of the sample was not given the drop-off/self-completion questionnaire and was instead asked to complete an additional vignettes questionnaire.

The SHARELIFE life history questionnaire was given in Wave 3 and Wave 7. Those respondents who did not respond to the Wave 3 SHARELIFE life history questionnaire was given the questionnaire in Wave 7 and those who were given the SHARELIFE questionnaire in Wave 3 responded to the regular Wave 7 questionnaire only.

Only respondents who completed the Wave 7 SHARELIFE questionnaire were given the condensed regular SHARE questionnaire, which covers the majority but not all questions of the regular SHARE questionnaire.

Cross-Study Differences with the HRS

No differences known.

Interview Status

Variable	Waves	Label	Type
rWiwstat	1-9	rWiwstat:ww r interview status	Categ
sWiwstat	1-9	sWiwstat:ww s interview status	Categ

How Constructed

rWiwstat gives the response and mortality status of the respondent at each wave. Respondents are identified by code 1, non-respondents are identified by codes 4-6, 9, and 10. Respondents who were not yet part of the sample at the given wave are identified by code 0.

Mortality status is derived from SHARE's Tracker file. Similar to the RAND HRS, non-response code 4 means that the respondent is alive (as far as we know) but did not respond. A code of 5 means that the respondent died between the last interview and the current one, and 6 means that the respondent had died before the previous wave. A code of 9 means that it is not known whether the individual is alive or not. A code of 10 means that the respondent's country did not take part in the current wave and it is not known whether the individual is alive or not. If the respondent's country did not participate in the given wave and the respondent participates or is known to be alive in the following wave, then **rWiwstat** is assigned a code of 4 for the given wave, confirming the respondent was alive but did not respond.

sWiwstat gives the response and mortality status of the current wave's spouse. It is taken from the spouse's **rWiwstat**. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. Note that when a spouse dies, the spouse interview status for the surviving spouse will have a code of (.u), meaning the respondent is unmarried if the widow/er does not remarry. A (.v) missing code indicates that there is no information in the Tracker file on why the spouse did not respond. Note also that **sWiwstat** is set to plain missing (.) if an individual did not respond to a particular interview, including if they died.

Cross Wave Differences in SHARE

In Wave 3 all respondents were asked to complete a life history survey instead of the regular SHARE questionnaire and in Wave 7 some respondents were asked to complete a life history survey instead of the regular SHARE questionnaire. In both these cases response to the SHARE life history survey is coded as 1.resp,alive for **rWiwstat** and is considered the same as responding to the regular SHARE questionnaire.

Cross-Study Differences with the HRS

No differences known.

Cohort

Variable	Waves	Label	Type
hacohort	All	hacohort: Sample cohort	Categ

How Constructed

hacohort identifies whether a household was part of the country-specific original cohort or was added later as part of a sample refreshment, which SHARE has done in 2006, 2010, 2013, 2015, 2017, 2019, and 2021. A code of 1 indicates the household was part of the original cohort for that country. Note that as different countries of SHARE were added into SHARE at different waves, a code of 1 does not correspond to any one particular year or wave. A code of 2 indicates the household was added to the SHARE sample as part of a refreshment in 2006. A code of 3 indicates the household was added to the SHARE sample as part of a refreshment in 2010. A code of 4 indicates the household was added to the SHARE sample as part of a refreshment in 2013. A code of 5 indicates the household was added to the SHARE sample as part of a refreshment in 2015. A code of 6 indicates the household was added to the SHARE sample as part of a refreshment in 2017. A code of 7 indicates the household was added to the SHARE sample as part of a refreshment in 2019. A code of 8 indicates the household was added to the SHARE sample as part of a refreshment in 2021.

Cross Wave Differences in SHARE

SHARE added a refreshment sample in 2006 as part of Wave 2. Another refreshment sample was added in 2010 as part of Wave 4. Again, in 2013 SHARE added another refreshment sample as part of Wave 5, in 2015 another sample was added as part of Wave 6, in 2017 another sample was added as part of Wave 7, in 2019 another sample was added as part of Wave 8, and in 2021 another sample was added as part of Wave 9.

Cross-Study Differences with the HRS

No differences known.

waveid_hh Identifier of original wave (household)

Whether Eligible for Sample			
Variable	Waves	Label	Type
rasampelig	All	rasampelig: r eligibility at wW sampling	Categ
sWsampelig	1-2, 4-9	sWsampelig:wW s eligibility at wW sampling	Categ

How Constructed

rasampelig indicates whether the respondent was eligible and responded to Wave 1 of SHARE. SHARE uses a multidimensional criterion to determine eligibility. A code of 1 indicates that the respondent was eligible and responded to Wave 1. A code of 0 indicates that the respondent was not eligible for Wave 1 or did not respond to Wave 1. Respondents that were not eligible for Wave 1 include: eligible respondents in Wave 1 households who did not respond to Wave 1, respondents from Wave 1 households who were not eligible at Wave 1, respondents who joined Wave 1 households after Wave 1, respondents from countries that were added to the SHARE sample after Wave 1, and respondents from households that were part of SHARE refreshment samples.

sWsampelig indicates the respondent's spouse's eligibility at the time of sampling. It is taken directly from the spouse's values for **rasampelig**. In addition to codes used for **rasampelig**, **sWsampelig** employs two special missing codes. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Sampling Design

Variable	Waves	Label	Type
rWwtsamp	1-9	rWwtsamp:ww design weight	Cont
rapsu1	All	rapsu1: primary sampling unit	Char
rapsu2	All	rapsu2: secondary sampling unit	Char
raestrat1	All	raestrat1: first stratification variable	Char
raestrat2	All	raestrat2: second stratification variable	Char

How Constructed

rWwtsamp indicates the respondent's design weight. **rWwtsamp** is taken directly from the sampling design weights provided by SHARE at each wave. Because the inclusion probability of any individual household member is the same as the inclusion probability for the entire household, these weights account for both the individual and the household. These weights are defined as inverse of the probability of being included in the sample at each wave, allowing users to compensate for unequal selection probabilities of the sample units. It is assigned special missing value (.m) if the respondent participated in the current wave but had no weight provided. It is assigned plain missing (.) if the respondent did not participate in the current wave.

rapsu1 indicates the respondent's primary sampling unit. **rapsu2** indicates the respondent's secondary sampling unit. **rapsu1** and **rapsu2** are taken directly from the primary and secondary sampling units provided by SHARE. The first non-missing primary and secondary sampling units were always used.

rapsu1 values are not provided for the respondents in Cyprus, Denmark, Estonia, Ireland, Luxembourg, Malta, or Switzerland. **rapsu1** values are missing for a majority of the respondents in France, Greece, Poland, and Sweden.

rapsu2 values are not provided for the respondents in Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Ireland, Israel, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Romania, Slovakia, Slovenia, Sweden, or Switzerland. **rapsu2** values are provided for Hungary, Italy, Portugal and Spain, but are missing for a majority of the respondents in Hungary and Spain.

raestrat1 indicates the respondent's first stratification variable. **raestrat2** indicates the respondent's second stratification variable. **raestrat1** and **raestrat2** are taken directly from the primary and secondary stratum provided by SHARE. The first non-missing primary and secondary stratum were always used.

raestrat1 values are not provided for the respondents in Denmark, Germany, Ireland, or Netherlands. **raestrat1** values are missing for a majority of the respondents in France, Portugal, and Sweden.

raestrat2 values are not provided for the respondents in Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Ireland, Israel, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Portugal, Spain, or Sweden. **raestrat2** values are provided for Hungary, Italy, Poland, Romania, Slovakia, Slovenia, and Switzerland, but are missing for a majority of the respondents in Poland and Switzerland.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

The RAND HRS provides **raehsamp**, which contains stratum-specific half sample code and can be used as a clustering indicator.

Continuous Variable Distributions

Variable	N	Mean	Std.Dev	Minimum	Maximum	Total missing

ral89wthh	All	ral89wthh:WW-WW household longitudinal weight	Cont
ral19wthh	All	ral19wthh:WW-WW household longitudinal weight	Cont

How Constructed

rWwthh is taken directly from SHARE's household weight variables **cchw_ww**, which are calibrated cross-sectional weights. Cross-sectional household weights are based on the household design weight and the calibration variables of all 50+ respondents in the same household. SHARE's calibration is based on the size of each country's population of individuals born in 1964 or earlier across eight gender-age groups. It is assigned special missing value (.m) if the respondent participated in the current wave but had no weight provided. It is assigned plain missing (.) if the respondent did not participate in the current wave.

ral12wthh is taken directly from SHARE's longitudinal household weight variable for households that responded to both Wave 1 and Wave 2. **ral23wthh** is taken directly from SHARE's longitudinal household weight variable for households that responded to both Wave 2 and Wave 3. **ral34wthh** is taken directly from SHARE's longitudinal household weight variable for households that responded to both Wave 3 and Wave 4. **ral45wthh** is taken directly from SHARE's longitudinal household weight variable for households that responded to both Wave 4 and Wave 5. **ral56wthh** is taken directly from SHARE's longitudinal household weight variable for households that responded to both Wave 5 and Wave 6. **ral67wthh** is taken directly from SHARE's longitudinal household weight variable for households that responded to both Wave 6 and Wave 7. **ral78wthh** is taken directly from SHARE's longitudinal household weight variable for households that responded to both Wave 7 and Wave 8. **ral89wthh** is taken directly from SHARE's longitudinal household weight variable for households that responded to both Wave 8 and Wave 9. **ral19wthh** is taken directly from SHARE's longitudinal household weight variable for households that responded to all Waves 1 - 9 of SHARE. Unlike the cross-sectional respondent weights, longitudinal household weights take into account the mortality of the original target population across waves. These variables are assigned special missing value (.m) if the respondent participated in both mentioned waves but had no weight provided. It is assigned plain missing (.) if the respondent did not participate in both mentioned waves.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

No differences known.

How Constructed

rWwtresp is taken directly from SHARE's respondent weight variables **cciw_wW** from Waves 1-6 and 8-9 and **cciw_w7_reg** for Wave 7, which are calibrated cross-sectional weights. Cross-sectional respondent weights are based on the household design weight and the calibration variables of the respondent. Cross-sectional respondent weights are only generated for respondents age 50 or older. SHARE's calibration is based on the size of each country's population of individuals born in 1964 or earlier across eight gender-age groups. It is assigned special missing value (.m) if the respondent participated in the current wave but had no weight provided. It is assigned plain missing (.) if the respondent did not participate in the current wave.

In Wave 7, **rWwtrespc** is taken directly from SHARE's respondent weight variable **cciw_wW** and applies to all respondents, including those who responded to the condensed and regular versions of the SHARE questionnaire for the wave. It is assigned special missing value (.m) if the respondent participated in the current wave but had no weight provided. It is assigned plain missing (.) if the respondent did not participate in the current wave.

ral12wtrsp is taken directly from SHARE's longitudinal household weight variable for respondents that responded to both Wave 1 and Wave 2. **ral23wtrsp** is taken directly from SHARE's longitudinal household weight variable for respondents that responded to both Wave 2 and Wave 3. **ral34wtrsp** is taken directly from SHARE's longitudinal household weight variable for respondents that responded to both Wave 3 and Wave 4. **ral45wtrsp** is taken directly from SHARE's longitudinal household weight variable for respondents that responded to both Wave 4 and Wave 5. **ral56wtrsp** is taken directly from SHARE's longitudinal household weight variable for respondents that responded to both Wave 5 and Wave 6. **ral67wtrsp** is taken directly from SHARE's longitudinal household weight variable for respondents that responded to both Wave 6 and Wave 7. **ral78wtrsp** is taken directly from SHARE's longitudinal household weight variable for respondents that responded to both Wave 7 and Wave 8. **ral89wtrsp** is taken directly from SHARE's longitudinal household weight variable for respondents that responded to both Wave 8 and Wave 9. **ral19wtrsp** is taken directly from SHARE's longitudinal household weight variable for respondents that responded to all Waves 1 - 9 of SHARE. Unlike the cross-sectional respondent weights, longitudinal respondent weights take into account the mortality of the original target population across waves. These variables are assigned special missing value (.m) if the respondent participated in both mentioned waves but had no weight provided. It is assigned plain missing (.) if the respondent did not participate in both mentioned waves.

Cross Wave Differences in SHARE

In Wave 7, **rWwtresp** is based on SHARE's respondent weight variables **cciw_w7_reg**, as it is the calibrated cross-sectional individual weight for the regular interview. **rWwtresp** is based on **cciw_w7** from Waves 1-6, and Wave 8-9.

In Wave 7, there is an additional cross-sectional individual weight, **rWwtrespc**, which provides the weight for all respondents, as those who responded to the regular questionnaire also responded to the condensed.

Cross-Study Differences with the HRS

No differences known.

Number of Household Respondents

Variable	Waves	Label	Type
hhWhhresp	1-2, 4-9	hhWhhresp:WW # core respondents in hh	Cont

How Constructed

hhWhhresp is the number of individuals in the household who actually responded at each wave. It counts the number of respondents sharing the same household ID. Thus, it may include the respondent, the spouse, and other age-eligible respondents within the household. In Wave 7, **hhWhhresp** includes the respondents who responded to the SHARELIFE questionnaire, who were given a condensed version of the regular questionnaire, as well as those who responded to the regular SHARE questionnaire. **hhWhhresp** is set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

In Wave 7, **hhWhhresp** includes the respondents who responded to the SHARELIFE questionnaire, who were given a condensed version of the regular questionnaire, as well as those who responded to the regular SHARE questionnaire.

Cross-Study Differences with the HRS

Unlike the HRS, the SHARE surveys any eligible individual present at the household during the time of the interview. So unlike the RAND HRS, **hhWhhresp** contains values greater than 2 when more than two people were interviewed in the same household.

Continuous Variable Distributions

Variable	N	Mean	Std.Dev	Minimum	Maximum	Total missing
hh1hhresp	30,416	1.64	0.51	1.00	5.00	0

Whether Couple Household

Variable	Waves	Label	Type
hWcp1	1-2, 4-9	hWcp1:ww whether coupled	Categ

How Constructed

hWcp1 indicates whether the respondent is treated as coupled or not. Although a household in SHARE may consist of more than one couple or single persons, this variable is constructed using **hWcoupid** and referring specifically to the RAND HRS definition of household, that is, either a couple or a single person. **hWcp1** is set to 1 if the respondent is coupled with another respondent in the current wave. **hWcp1** is set to 0 if the respondent is not coupled with any other respondent in the current wave. **hWcp1** is set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

hWcp1 is the Gateway Harmonized SHARE's corollary to the RAND HRS's **hWcp1**. Because households in SHARE are not limited to one couple, **hWcp1** is specified at the household couple level instead of the whole household level.

Categorical Variable Frequencies

	h1cp1	h2cp1	h4cp1	h5cp1

Financial, Household, Family Respondent

Variable	Waves	Label	Type
rWfinr	1-2, 4-9	rWfinr:ww whether r financial resp	Categ
sWfinr	1-2, 4-9	sWfinr:ww whether s financial resp	Categ
rWhhr	1-2, 4-9	rWhhr:ww whether r hh resp	Categ
sWhhr	1-2, 4-9	sWhhr:ww whether s hh resp	Categ
rWfamr	1-2, 4-9	rWfamr:ww whether r family resp	Categ
sWfamr	1-2, 4-9	sWfamr:ww whether s family resp	Categ

How Constructed

In Wave 1, couple members could decide to answer questions about their finances separately or designate one person to answer on behalf of the couple. Starting in Wave 2, this choice is not given and only one respondent answers financial questions for the couple. All single respondents need to answer the financial questions.

rWfinr indicates whether the respondent answered the financial questions. **sWfinr** indicates whether the current wave's spouse was the financial respondent. It is taken from the spouse's **rWfinr**. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used. **rWfinr** and **sWfinr** are set to plain missing (.) for respondents who did not respond to the current wave.

rWhhr indicates whether the respondent answered the household modules: Housing, Household Income, and Consumption Modules. **sWhhr** indicates whether the current wave's spouse was the household respondent. It is taken from the spouse's **rWhhr**. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used. **rWhhr** and **sWhhr** are set to plain missing (.) for respondents who did not respond to the current wave.

For each couple, one respondent was asked to answer the family modules: the Children Module and part of the Social Support Module. The first person interviewed from the couple is the family respondent.

rWfamr indicates whether the respondent answered the family questions for the couple. **sWfamr** indicates whether the current wave's spouse was the family respondent. It is taken from the spouse's **rWfamr**. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used. **rWfamr** and **sWfamr** are set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

In Wave 1, couple members could decide whether to answer the financial questions separately. Starting in Wave 2, financial questions are only answered by the designated financial respondent on behalf of the couple.

Cross-Study Differences with the HRS

The "household respondent" is specific to SHARE and motivated by the initial sample design of this survey. The categorization in RAND HRS only comprises the financial and the family respondents.

Whether Proxy Interview

Variable	Waves	Label	Type
rWproxy	1-2, 4-9	rWproxy:WW whether r proxy interview	Categ

How Constructed

rWproxy indicates proxy status over a number of different SHARE modules: Demographics, Physical Health, Behavioural Risks, Health Care, Employment, Children, Social Support, Financial Transfers, Housing, Household Income, Consumption, and Assets. A code of 0 is used if the respondent never used a proxy. A code of 1 is used when the interview was completed partially or completely by proxy in at least one of the modules. **rWproxy** is set to 2 if all the modules were answered solely by proxy. **rWproxy** is set to plain missing (.) for respondents who did not respond to the current wave.

sWproxy indicates whether the current wave's spouse's interview was by proxy. It is taken from the spouse's **rWproxy**. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.)u is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Interview Dates

Variable	Waves	Label	Type
rWiwm	1-2, 4-9	rWiwm:ww r interview month	Cont
sWiwm	1-2, 4-9	sWiwm:ww s interview month	Cont
rWiwy	1-2, 4-9	rWiwy:ww r interview year	Cont
sWiwy	1-2, 4-9	sWiwy:ww s interview year	Cont

How Constructed

These variables are derived from the reported month and year when the interview took place.

rWiwm and **rWiwy** indicate the interview month and year, respectively. **rWiwm** and **rWiwy** are set to plain missing (.) for respondents who did not respond to the current wave.

sWiwm and **sWiwy** indicate the current wave's spouse's interview month and year, respectively. They are taken from the spouse's **rWiwm** and **rWiwy**, respectively. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

Unlike the HRS, SHARE does not mark interviews with beginning and ending dates. Instead, SHARE provides information down to the year and month when the interview took place. Thus, unlike in the RAND HRS where interview dates are derived as the midpoint between the reported beginning and ending dates, there are no midpoint calculations for the interview date variables in Gateway Harmonized SHARE.

Birth Date

Variable	Waves	Label	Type
rabyear	All	rabyear: r birth year	Cont
sWbyear	1-2, 4-9	sWbyear: s birth year	Cont
rabmonth	All	rabmonth: r birth month	Cont
sWbmonth	1-2, 4-9	sWbmonth: s birth month	Cont

How Constructed

rabyear is the respondent's reported birth year. **rabmonth** is the respondent's reported month of birth. **rabyear** and **rabmonth** are taken from the first non-missing value of birth data. Don't know, refused, and missing responses are assigned special missing (.d), (.r), (.m), respectively.

sWbyear and **sWbmonth** indicate the current wave's spouse's birth year and month, respectively. They are taken from the spouse's **rabyear**. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Original SHARE Variables Used

Tracker and Weights:

yrbirth	Year of birth
mobirth	Month of birth

Death Date

Variable	Waves	Label	Type
radyear	All	radyear: r death year	Cont
radmonth	All	radmonth: r death month	Cont

How Constructed

radyear is the respondent's reported death year. **radmonth** is the respondent's reported month of death. **radyear** and **radmonth** are based on questions asked as part of the exit interview each wave starting with Wave 2. When the respondents' proxies don't know or refuse to answer, **radyear** is assigned special missing values (.d) or (.r), respectively. **radyear** is assigned special missing value (.i) for impossible responses to death year. **radyear** is assigned special missing (.x) if the respondent has not yet passed away.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

No differences known.

Continuous Variable Distributions

Variable	N	Mean	Std.Dev	Minimum	Maximum	Total missing
radyear	21,508	2,015.29	4.30	2,004.00	2,022.00	137,256
radmonth	21,116	6.38	3.57	1.00	12.00	137,648

Original SHARE Variables Used

Tracker and Weights:

deceased_year	Year of decease
deceased_month	Month of decease

Age at Interview

Variable	Waves	Label	Type
rWagey	1-2, 4-9	rWagey:ww r age (years) at iww	Cont
sWagey	1-2, 4-9	sWagey:ww s age (years) at iww	Cont
rWagem	1-2, 4-9	rWagem:ww r age (months) at iww	Cont
sWagem	1-2, 4-9	sWagem:ww s age (months) at iww	Cont

How Constructed

rWagey is the respondent's age in years at the time of the current wave's interview. **rWagem** is the respondent's age in months at the time of the current wave's interview. When respondents don't know or refuse to answer, **rWagey** and **rWagem** are assigned special missing values (.d) or (.r), respectively. Otherwise missing responses are assigned special missing (.m). **rWagey** and **rWagem** are set to plain missing (.) for respondents who did not respond to the current wave.

sWagey and **sWagem** are the current spouse's age in years and months, respectively, at the time of the current wave's interview. They are taken from the spouse's **rWagey** and **rWagem**. In addition to the special missing codes employed by **rWagey** and **rWagem**, **sWagey** and **sWagem** employ two additional missing codes, (.u) and (.v). If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

Unlike the HRS, SHARE does not mark interviews with beginning and ending dates. Thus, unlike in the RAND HRS where interview ages are derived for the beginning, midpoint, and end of the survey, there is only one age variable derived per wave in Gateway s.

Continuous Variable Distributions

Gender

Variable	Waves	Label	Type
ragender	All	ragender: r gender	Categ
sWgender	1-2, 4-9	sWgender:wW s gender	Categ

How Constructed

ragender is derived using the gender variable in the SHARE tracker file. If this is not available, then **ragender** takes the gender reported in the Demographics module. **ragender** is coded as 1.man and 2.woman.

sWgender indicates the current wave's spouse's gender. It is taken from the spouse's **ragender**. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

Education

Variable	Waves	Label	Type
raedyrs	All	raedyrs: r years of education	Cont
sWedyrs	1-2, 4-9	sWedyrs:wW s years of education	Cont
rafedyrs	All	rafedyrs: r impflag: years of education	Categ
sWfedyrs	1-2, 4-9	sWfedyrs:impflag wW s years of education	Categ

How Constructed

raedyrs is the number of years of education. Years of education is constructed by looking at reports from all waves of data. Missing responses are assigned special missing (.m). In Wave 7, **raedyrs** is assigned special missing (.s) if the respondent is still in school.

sWedyrs indicates the current wave's spouse's years of education. It is taken from the spouse's **raedyrs**. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

rafedyrs is taken directly from SHARE's years of education imputation flag. In all waves, SHARE provides imputations for years of education. For more information on the imputations see **implicat**. The first non-missing value for years of education was always used. A code of 0 indicates that the respondent's **raedyrs** value was not imputed. A code of 1 indicates that the respondent's **raedyrs** value was imputed using SHARE's multiple imputation method.

sWfedyrs indicates whether the current wave's spouse's years of education is imputed. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

In Wave 1, respondents provide information on the highest school degree and degree of further education or vocational training. Years of education are not asked directly but derived from ISCED categories. Starting in Wave 2, years of education are asked of each respondent, whereas information on education degrees is only asked of new respondents.

In Wave 1, the highest number of years of education reported is 21. In Waves 2 through 6, the highest number of years of education reported is 25. Starting in Wave 7, the highest number of years of education reported is 38.

Cross-Study Differences with the HRS

In RAND HRS, the maximum value that **raedyrs** can take is 17, indicating 17 or more years of education. In Gateway Harmonized SHARE, the maximum number of years of education is 21 in Wave 1, 25 in Waves 2 through 6, and 38 starting in Wave 7.

International Standard Classification of Education

Variable	Waves	Label	Type
raedisced	All	raedisced: r education by isced code	Categ
sWedisced	1-2, 4-9	sWedisced:ww s education by isced code	Categ
rafedisced	All	rafedisced:impflag r education by isced code	Categ
sWfedisced	1-2, 4-9	sWfedisced:impflag ww s education by isced code	Categ

How Constructed

In order to provide a harmonized measure of education across all countries included in SHARE, the survey categorized education achievements using the 1997 International Standard Classification of Education ISCED-97 codes. Respondents were asked to report their highest school degree and degrees of further education or vocational training as in their country's educational system. SHARE then asked educational experts in each country to map local educational achievements to ISCED codes. For more information on ISCED codes see www.uis.unesco.org.

raedisced is constructed by looking at reports from all waves of data. The first non-missing report of education level by ISCED code is always used. In all waves SHARE provides imputations for ISCED codes. For more information on the imputations see **implicat**. **raedisced** is coded as follows: 0.None, 1.Primary education, 2.Lower secondary education, 3.Upper secondary education, 4.Post-secondary non-tertiary education, 5.First stage of tertiary education, 6.Second stage of tertiary education. Don't know, refused, or otherwise missing responses are assigned special missing values (.d), (.r), (.m), respectively. **raedisced** is set to plain missing (.) for respondents who did not respond to any waves.

sWedisced indicates the current wave's spouse's ISCED code. It is taken from the spouse's **raedisced**. In addition to specific missing codes used for **raedisced**, **sWedisced** employs two other special missing codes. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

rafedisced is taken directly from SHARE's ISCED code imputation flag. A code of 0 indicates that the respondent's **rafedisced** value was not imputed. A code of 1 indicates that the respondent's **rafedisced** value was imputed using SHARE's multiple imputation method.

sWfedisced flags imputations in the respondent's spouse's ISCED code and is taken directly from the spouse's **rafedisced**. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

After Wave 1, educational degree questions are asked of new respondents only.

ISCED code 6 (second stage of tertiary education) was not asked in all countries.

Cross-Study Differences with the HRS

The HRS does not include an education variable coded according to the ISCED categories.

sWfeduc1	1-2, 4-9	sWfeduc1:impflag wW s harmonized education level	Categ

How Constructed

raeducel and **raeduc1** identify the level of education completed according to five-tier and three-tier harmonized scales which we developed to compare education levels across countries. These Harmonized education scales are simplified versions of 1997 International Standard Classification of Education (ISCED-97) codes. For more information on ISCED codes, see www.uis.unesco.org and the OECD document entitled "Classifying Educational Programmes: Manual for ISCED-97 Implementation in OECD Countries, 1999 Edition". **raeducel** is coded as follows: 1.Less than primary education, 2.Primary education, 3.Lower secondary education, 4.Upper secondary & vocational training, and 5.Tertiary education. **raeduc1** is coded as follows: 1.Less than upper secondary education, 2.Upper secondary & vocational training, and 3.Tertiary education. These variables are built using **raedisced**. Less than primary education is equivalent to no education. Less than upper secondary education is equivalent to no education, primary education, and lower secondary education. Upper secondary and vocational training is equivalent to upper secondary and post-secondary non-tertiary education. Tertiary education is equivalent to the first and second stage of tertiary education. Don't know, refused, or otherwise missing responses are assigned special missing values (.d), (.r), (.m), respectively.

rafeduc1 is a flag variable indicating if the respondent's education has been imputed. **rafeduc1** is coded as 0 if the respondent's education level was not imputed. **rafeduc1** is coded as 1 if the respondent's education level was imputed. Missing values are assigned special missing (.m).

sWeducel, **sWeduc1**, and **sWfeduc1** indicate the current spouse's harmonized category of education in each wave and corresponding flag variable, and their values are taken from **raeducel**, **raeduc1**, and **rafeduc1**, respectively. In addition to the special missing codes employed by **raeducel**, **raeduc1**, and **rafeduc1**, **sWeducel**, **sWeduc1**, and **sWfeduc1** employ two additional special missing codes, (.u) and (.v). If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

raeduc1 is included in the Harmonized HRS, and **raeducel** will be included in its next release.

Current Marital Status

Variable	Waves	Label	Type
rWmstat	1-2, 4-9	rWmstat:wW r marital status w/partners, filled	Categ
sWmstat	1-2, 4-9	sWmstat:wW s marital status w/partners, filled	Categ

How Constructed

This variable is created using current marital status reported for each wave. Partnership status is implied for respondents who report being currently unmarried/unpartnered but coupled with another respondent through **hWcupid**.

rWmstat records the respondent's marital status in the current wave with implied partnership status. A code of 1 indicates that the respondent is married. A code of 3 indicates that the respondent is partnered, either through self-reported or implied partnership. A code of 4 indicates that the respondent is separated. A code of 5 indicates that the respondent is divorced. A code of 7 indicates that the respondent is widowed. A code of 8 indicates that the respondent has never been married. When respondents don't know or refuse to answer, **rWmstat** is assigned special missing values (.d) or (.r), respectively. Otherwise missing responses are assigned special missing value (.m). **rWmstat** is set to plain missing (.) for respondents who did not respond to the current wave.

sWmstat records the current wave's spouse's marital status. It is taken from the spouse's **rWmstat**. In addition to the special missing codes of **rWmstat**, **sWmstat** employs two other special missing codes. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

In the RAND HRS, the variable **rWmstat** can take value 2, indicating that the respondent is married but the spouse is absent. Since SHARE does not survey respondents as to whether they are married but their spouse is absent, **rWmstat** is never equal to 2 in Gateway Harmonized SHARE.

Current Partnership Status

Variable	Waves	Label	Type
rWmpart	1-2, 4-9	rWmpart:ww r implied partnership status	Categ
sWmpart	1-2, 4-9	sWmpart:ww s implied partnership status	Categ

How Constructed

In all waves, partnership is implied if the respondent reports being currently unmarried/unpartnered but is coupled with another respondent through **hWcupid**.

rWmpart indicates whether a respondent partnership is implied in the current wave. A code of 0 indicates it has not been implied that the respondent is partnered; a code of 1 indicates it has been implied that the respondent is partnered. **rWmpart** is set to plain missing (.) for respondents who did not respond to the current wave.

sWmpart indicates whether the current wave's spouse is considered partnered. It is taken from the spouse's **rWmpart**. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Without Partnership

Variable	Waves	Label	Type
rWmstath	1-2, 4-9	rWmstath:WW r marital status	Categ
sWmstath	1-2, 4-9	sWmstath:WW s marital status	Categ

How Constructed

This variable is created using current marital status reported for each wave. The **rWmstath** variables code partnership, which overrides actual marital status. **rWmstath** ignores implied partnership status and indicates reported marital status in the current wave. A code of 1 indicates that the respondent is married. A code of 3 indicates that the respondent is in a registered partnership. A code of 4 indicates that the respondent is separated. A code of 5 indicates that the respondent is divorced. A code of 7 indicates that the respondent is widowed. A code of 8 indicates that the respondent has never been married. When respondents don't know or refuse to answer, **rWmstath** is assigned special missing values (.d) or (.r), respectively. Otherwise missing responses are assigned special missing value (.m). **rWmstath** is set to plain missing (.) for respondents who did not respond to the current wave.

sWmstath indicates the current wave's spouse's marital status without partnership. It is taken from the spouse's **rWmstath**. In addition to specific missing codes used for **rWmstath**, **sWmstath** employs two other special missing codes. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

In the RAND HRS, the variable **rWmstath** can take value 2, indicating that the respondent is married but the spouse is absent. Since SHARE does not survey respondents as to whether they are married but their spouse is absent, **rWmstath** is never equal to 2 in Gateway Harmonized SHARE.

Length of Current Marriage

Variable	Waves	Label	Type
rWmcurln	1-2, 4-9	rWmcurln:wW r length of current marriage	Cont
sWmcurln	1-2, 4-9	sWmcurln:wW s length of current marriage	Cont

How Constructed

SHARE surveys one respondent of each couple as to the starting year of their current marriage in the first interview in which they report the marriage. In subsequent interviews one respondent of each couple is asked whether their marital status has changed since the last wave and if the marital status has not changed, the respondent is not asked again to report the starting year of their current marriage.

rWmcurln is the length of the respondent's current marriage in years with reference to the current wave. The first time a respondent reports being married and living with their spouse or being married but living separated from their spouse, they are asked the year they got married. In these cases, the length of the current marriage is calculated by subtracting the year when the couple married from the interview date at the current wave. In subsequent interviews, if the respondent reports that their marital status has not changed since the previous wave, **rWmcurln** is derived by adding the number of years between the previous interview and the current interview to the length of current marriage determined for the previous wave. If either the year of the marriage or the interview date is missing, the marriage length is not calculated. A special missing code of (.i) is used when the respondent reported a marriage date later than the date of interview. The value of **rWmcurln** is copied over to the coupled spouse who was not asked the starting year of their marriage based on their spouse's answer to the year their relationship started. Special missing (.u) is assigned if the respondent reported being in a registered partnership, never having been married, being divorced, or being widowed. Don't know, refused, or otherwise missing responses are assigned special missing values (.d), (.r), (.m), respectively. **rWmcurln** is set to plain missing (.) for respondents who did not respond to the current wave.

sWmcurln is the length of the current wave's spouse's current marriage. It is taken from the spouse's **rWmcurln**. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

In Wave 7 a question about the starting year of marriage was not asked to respondents who answered the Wave 7 SHARELIFE questionnaire.

Cross-Study Differences with the HRS

No differences known.

dn017_	Year of marriage, if living separated

Wave 9:

dn014_	Marital status
dn044_	Marital status changed
dn015_	Year of marriage, if living together
dn017_	Year of marriage, if living separated

Place of Birth

Variable	Waves	Label	Type
rabplace	All	rabplace: r place of birth	Categ
sWbplace	1-2, 4-9	sWbplace:WW s place of birth	Categ

How Constructed

Place of birth was derived by looking at reports from all waves of data. **rabplace** indicates the respondent's reported birthplace. **rabplace** is coded using ISO 3166-1 (Numeric-3). When respondents don't know or refuse to answer, **rabplace** is assigned special missing values (.d) or (.r), respectively. Otherwise missing responses are assigned special missing value (.m).

sWbplace is the place of birth of the current wave's spouse. It is taken from the spouse's **rabplace**. In addition to the special missing codes used for **rabplace**, **sWbplace** employs two other special missing codes. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

While HRS does elicit information about the country of birth, the information from this question is not available in the public use data files.

Born in Country of Interview

Variable	Waves	Label	Type
rabcountry	All	rabcountry: r born in country of interview	Categ
sWbcountry	1-2, 4-9	sWbcountry:WW s born in country of interview	Categ

How Constructed

rabcountry indicates whether the respondent was born in their interview country. **rabcountry** is assigned a 0 if the interview did not take place in the country of birth, and is assigned a 1 if the interview did take place in the country of birth. Place of birth was derived by looking at reports from all waves of data. When respondents don't know, refuse to answer, or are missing, **rabcountry** is assigned special missing values (.d), (.r), or (.m), respectively.

sWbcountry indicates whether the respondent's current wave's spouse was born in their interview country. It is taken from the spouse's **rabcountry**. In addition to the special missing codes used for **rabcountry**, **sWbcountry** employs two other special missing codes, (.u) and (.v). If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

The RAND HRS contains the variable **rabplace** which can be used to identify respondents who were not born in the US.

Citizenship Status

Variable	Waves	Label	Type
racitizen	All	racitizen: r whether citizen at baseline interview	Categ
sWcitizen	1-2, 4-9	sWcitizen:WW s whether citizen at baseline interview	Categ

How Constructed

racitizen indicates whether the respondent was a citizen of their country of interview at the time of their baseline interview. **racitizen** is coded as 1 if the respondent was a citizen at the time of their first interview, and is coded as 0 if they were not a citizen at that time. Don't know, refuse, and other missing responses to **racitizen** are set to special missing (.d), (.r), and (.m), respectively.

sWcitizen indicates whether the respondent's spouse was a citizen of their country of interview at the time of their baseline interview and is taken directly from the respondent's spouse's values to **racitizen**. In addition to the special missing codes used in **racitizen**, **sWcitizen** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

The HRS began asking about citizenship starting in Wave 8. As such, respondents who were only interviewed in Waves 1 through 7 will not have a value for **racitizen** in the Harmonized HRS. SHARE has asked about citizenship in all waves.

Religion

Variable	Waves	Label	Type
<code>rarelig_s</code>	All	<code>rarelig_s</code> : r religion	Categ
<code>sWrelig_s</code>	1	<code>sWrelig_s</code> :wW s religion	Categ

How Constructed

`rarelig_s` is the respondent's reported religion in the first wave of SHARE. `rarelig_s` is coded as follows: 1.Protestant, 2.Catholic, 3.Orthodox, 4.Jewish, 5.Muslim, 6.Other, and 7.None/no preference. This question is only asked in Wave 1 in the self-completion questionnaire, as such, a special missing value (.c) is employed if the respondent did not complete the self-completion questionnaire in Wave 1, and a special missing value .w is employed if the respondent did not respond at all to Wave 1. Don't know, refused, or otherwise missing responses are assigned special missing values (.d), (.r), (.m), respectively.

`s1relig_s` indicates the current wave's spouse's reported religion in Wave 1. `s1relig_s` is taken directly from the spouse's `rarelig_s`. If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

Religion is only surveyed by SHARE in the self-completion questionnaire in Wave 1.

Cross-Study Differences with the HRS

In RAND HRS, `rarelig` only takes values from 1 (protestant) to 5 (other). In Gateway Harmonized SHARE, `rarelig_s` adds additional categories of Muslim and Orthodox.

Categorical Variable Frequencies

	<code>rarelig_s</code>
1.Protestant	4,597

q1	How satisfied with life in general

Region of Residence			
Variable	Waves	Label	Type
hWrural	1-2, 4-9	hWrural:ww lives in rural or urban	Categ

How Constructed

hWrural indicates whether the household respondent lives in an urban or rural area. **hWrural** is assigned 0.urban or 1.rural based on the interviewer's observation of where the respondent lives. If the interviewer selected "a big city", "the suburbs or outskirts of a big city", "a large town", or "a small town" as the household respondent's area of residence, then **hWrural** is set to 0 for an urban area. If the interviewer selected "a rural area or village" as the household respondent's area of residence, then **hWrural** is set to 1 for a rural area. Don't know, refuse, and other missing values of **hWrural** are assigned special missing codes (.d), (.r), (.m), respectively. **hWrural** is set to blank missing (.) when respondents did not participate in the current wave.

Please note that these values are based on interviewer observations for the household respondent, rather than self-reported by the respondent or assigned based on sampling procedures. This value is copied to the other members of the household respondent's household. There is a variable for self-reported region of residence in Waves 1 and 2, but not for the other waves.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

A comparable variable is included in the Harmonized HRS.

Categorical Variable Frequencies

Interview in Nursing Home

Variable	Waves	Label	Type
rWnhmliv	2, 4-9	rWnhmliv:WW R Live in Nurs home at interview	Categ
sWnhmliv	2, 4-9	sWnhmliv:WW S Live in Nurs home at interview	Categ

How Constructed

In general, the SHARE study population is restricted to people residing in private households at the time of sampling and at the time of fieldwork. This is not always true as certain countries used a population register as a sampling frame, in which case residents of residential and nursing homes are included, for example Denmark and Sweden. As the waves progress, SHARE does follow previously interviewed respondents into institutions, such as nursing homes.

rWnhmliv indicates whether the respondent lives in a nursing home at the time of the interview. If the respondent lives in a nursing home at the time of the interview, then **rWnhmliv** is coded as 1, if they lived in a private household, then **rWnhmliv** is coded as 0. Don't know, refuse, and other missing responses to **rWnhmliv** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWnhmliv indicates whether the respondent's spouse lived in a nursing home at the time of the interview and is taken directly from the respondent's spouse's values to **rWnhmliv**. In addition to the special missing codes used in **rWnhmliv**, **sWnhmliv** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Although certain countries at Wave 1 did have interviews in nursing homes, SHARE does not provide an indicator of where the interview took place until Wave 2.

Cross-Study Differences with the HRS

There are differences in the SHARE sampling strategy as compared to the HRS sampling strategy, but no significant differences in the information provided by **rWnhmliv**.

B. Health

Self-Report of Health

Variable	Waves	Label	Type
rWshlt	1-2, 4-9	rWshlt:ww R self-report of health	Categ
sWshlt	1-2, 4-9	sWshlt:ww S self-report of health	Categ
rWshltf	1	rWshltf:ww R flag position of self-report health	Categ
sWshltf	1	sWshltf:ww S flag position of self-report health	Categ
rWshlta	1	rWshlta:ww R self-report of health alt	Categ
sWshlta	1	sWshlta:ww S self-report of health alt	Categ
rWshltaf	1	rWshltaf:ww R flag position of self-report health alt	Categ
sWshltaf	1	sWshltaf:ww S flag position of self-report health alt	Categ

How Constructed

rWshlt is the respondent's self-reported general health status using the following scale: 1.Excellent, 2.Very good, 3.Good, 4.Fair, and 5.Poor.

When respondents don't know, refuse to answer, or are missing, **rWshlt** is assigned special missing values (.d), (.r), or (.m), respectively. **rWshlt** is set to missing (.) for respondents who did not respond to the current wave.

In Wave 1, the question is asked either at the beginning or at the end of the Health module (PH). **r1shltf** indicates this timing. Specifically, a code of 1 indicates that the respondent was asked **rWshlt** at the beginning of the module. A code of 2 indicates that the respondent was asked **rWshlt** at the end of the module.

sWshlt is the respondent's spouse's self-reported general health status taken directly from the spouse's **rWshlt**. **sWshltf** indicates whether the respondent's spouse was asked **rWshlt** at the beginning or at the end of the module and is taken directly from the spouse's **rWshltf**. In addition to the special missing codes used in **rWshlt**, **sWshlt** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

In Wave 1, SHARE also employs a second scale of self-reported general health status using the following scale: 1.Very good, 2.Good, 3.Fair, 4.Bad, and 5.Very bad. **rWshlta** is the respondent's self-reported general health status according to this scale. When respondents don't know, refuse to answer, or are missing, **rWshlta** is assigned special missing values (.d), (.r), or (.m), respectively. **rWshlta** is set to plain missing (.) for respondents who did not respond to the current wave.

sWshlta is the respondent's spouse's self-reported general health status taken directly from the spouse's **rWshlta**. In addition to the special missing codes used in **rWshlta**, **sWshlta** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

As with **rWshlt**, respondents were asked **rWshlta** either at the beginning or at the end of the Health module (PH). **rWshltaf** indicates this timing. A code of 1 indicates that the respondent was asked **rWshlta** at the beginning of the module. A code of 2 indicates that the respondent was asked **rWshlta** at the end of the module.

sWshltaf indicates whether the respondent's spouse was asked **rWshlta** at the beginning or at the end of the health module and is taken directly from the spouse's **rWshltaf**. Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 1, there are two questions for self-reported general health status. In one, health status is rated as Excellent (1), Very Good (2), Good (3), Fair (4), or Poor (5). In the other, health status is rated as Very Good (1), Good (2), Fair (3), Bad (4), or Very Bad (5). In Wave 2 and forward, respondents are only asked the former question.

Further, in Wave 1 the two possible questions about health status were asked at two different stages of the interview. Specifically, one was asked at the beginning and the other at the end of Health module (PH). Each respondent was randomly assigned one of the two question types at the beginning of the module and the other at the end. In Wave 2 and forward, one question about health status was asked at the beginning of the module.

Cross-Study Differences with the HRS

In the HRS, self-reported health status is rated according to the scale Excellent (1), Very Good (2), Good (3), Fair (4), or Poor (5). SHARE employs the same scale in Wave 2 and onward. However, limited to Wave 1, SHARE uses this scale as well as a second scale where self-reported general health can be rated as Very Good (1), Good (2), Fair (3), Bad (4), or Very Bad (5). In Gateway Harmonized SHARE, **rWshlt** is the respondent's self-reported health status according to the latter scale. This variable does not have an analogue in the RAND HRS.

Whether Health Limits Activities or Work

Variable	Waves	Label	Type
rWhlthlma	1-2, 4-9	rWhlthlma:WW R hlth problem limits activities	Categ
sWhlthlma	1-2, 4-9	sWhlthlma:WW S hlth problem limits activities	Categ
rWhlthlm	2, 4-9	rWhlthlm:WW R hlth problem limits work	Categ
sWhlthlm	2, 4-9	sWhlthlm:WW S hlth problem limits work	Categ

How Constructed

rWhlthlma indicates whether an impairment or health problem limits typical activities (including work). The original SHARE question asks about the extent to which respondents are limited by health problems in their usual activities. Possible answers are “severely limited,” “limited, but not severely,” and “not limited.” **rWhlthlma** simply recodes the original SHARE variable as a yes/no indicator. Thus, a code of 0 indicates that the respondent reports their usual activities not being limited by a health problem, whereas a code of 1 indicates that the respondent reports their usual activities being limited by a health problem. When respondents don’t know, refuse to answer, or are missing, **rWhlthlma** is assigned special missing values (.d), (.r), or (.m), respectively. **rWhlthlma** is set to plain missing (.) for respondents who did not respond to the current wave.

sWhlthlma is the respondent’s spouse’s indicator of whether usual activities are limited by health problems and is taken directly from the spouse’s **rWhlthlma**. In addition to the special missing codes used in **rWhlthlma**, **sWhlthlma** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWhlthlm indicates whether any health problem or disability limits the kind or amount of paid work. A code of 0 indicates that the respondent reports their paid work not being limited by a health problem, whereas a code of 1 indicates that the respondent reports their paid work being limited by a health problem. Starting in Wave 4, this question is not asked if the respondent is greater than 75 years of age, and so **rWhlthlm** is assigned special missing (.a). When respondents don’t know, refuse to answer, or are missing, **rWhlthlm** is assigned special missing values (.d), (.r), or (.m), respectively. **rWhlthlm** is set to plain missing (.) for respondents who did not respond to the current wave.

sWhlthlm is the respondent’s spouse’s indicator of whether the kind or amount of paid work are limited by health problems or disability and is taken directly from the spouse’s **rWhlthlm**. In addition to the special missing codes used in **rWhlthlm**, **sWhlthlm** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Starting in Wave 2, respondents are asked whether the kind or amount of paid work they can do is limited by health problems or disability. Starting in Wave 4, this question is not asked to respondents greater than 75 years of age. This question is not asked at all in Wave 1.

Cross-Study Differences with the HRS

While both surveys ask about limitations in paid work, SHARE also asks the extent to which respondents are limited in “activities people usually do.”

sWtoilta	1-2, 4-9	sWtoilta:WW S Some Diff-Using the toilet	Categ

How Constructed

These variables indicate difficulty with activities of daily living (ADLs). The ADLs include walking across a room (**rWwalkra**), dressing (**rWdressa**), bathing (**rWbatha**), eating (**rWeata**), getting in and out of bed (**rWbeda**), and using the toilet (**rWtoilta**). A code of 0 indicates that the respondent did not report any problems with the activity. A code of 1 indicates that the respondent reported some difficulty with the activity. When respondents don't know, refuse to answer, or are missing, **rWwalkra**, **rWdressa**, **rWbatha**, **rWeata**, **rWbeda**, and **rWtoilta** are assigned special missing values (.d), (.r), or (.m), respectively. **rWwalkra**, **rWdressa**, **rWbatha**, **rWeata**, **rWbeda**, and **rWtoilta** are set to plain missing (.) for respondents who did not respond to the current wave.

sWwalkra, **sWdressa**, **sWbatha**, **sWeata**, **sWbeda**, and **sWtoilta** indicate whether the respondent's spouse reported any difficulty with each one of these daily living activities and are taken directly from the spouse's **rWwalkra**, **rWdressa**, **rWbatha**, **rWeata**, **rWbeda**, and **rWtoilta**, respectively. In addition to the special missing codes used in **rWwalkra**, **rWdressa**, **rWbatha**, **rWeata**, **rWbeda**, and **rWtoilta**, **sWwalkra**, **sWdressa**, **sWbatha**, **sWeata**, **sWbeda**, and **sWtoilta** employ the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Some of these variables are used to construct a number of functional limitation indices, including an ADL summary index. Please see "ADLS Summary" and "Other Summary Indices".

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

No differences known.

Original SHARE Variables Used

Wave 1:

pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed
pho49d6	Difficulties: using the toilet, incl getting up or down

Wave 2:

pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed
pho49d6	Difficulties: using the toilet, incl getting up or down

Wave 4:

pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed
pho49d6	Difficulties: using the toilet, incl getting up or down

Wave 5:

pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed
pho49d6	Difficulties: using the toilet, incl getting up or down

Wave 6:

pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed
pho49d6	Difficulties: using the toilet, incl getting up or down

Wave 7:

pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed
pho49d6	Difficulties: using the toilet, incl getting up or down

Wave 8:

pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering

Section B. Health

pho49d4	Difficulties: eating, cutting up food

sWlaundrya	6-9	sWlaundrya:ww S some diff-doing laundry	Categ

How Constructed

These variables indicate difficulty with instrumental activities of daily living (IADLs). The IADLs include using the phone (**rWphonea**), taking medications (**rWmedsa**), managing money (**rWmoneya**), shopping for groceries (**rWshopa**), preparing meals (**rWmealsa**), using a map (**rWmapa**), doing work around the house and garden (**rWhousewka**), leaving the house alone and using transportation (**rWleavhsa**), and doing the laundry (**rWlaundrya**). A code of 0 indicates that the respondent did not report any problems with the instrumental activity. A code of 1 indicates that the respondent reported some difficulty with the instrumental activity. When respondents don't know, refuse to answer, or are missing, **rWphonea**, **rWmedsa**, **rWmoneya**, **rWshopa**, **rWmealsa**, **rWmapa**, **rWhousewka**, **rWleavhsa**, and **rWlaundrya** are assigned special missing values (.d), (.r), or (.m), respectively. **rWphonea**, **rWmedsa**, **rWmoneya**, **rWshopa**, **rWmealsa**, **rWmapa**, **rWhousewka**, **rWleavhsa**, and **rWlaundrya** are set to plain missing (.) for respondents who did not respond to the current wave.

sWphonea, **sWmedsa**, **sWmoneya**, **sWshopa**, **sWmealsa**, **sWmapa**, **sWhousewka**, **sWleavhsa**, and **sWlaundrya** indicate whether the respondent's spouse reported any difficulty with instrumental activities of daily living and are taken directly from the spouse's **rWphonea**, **rWmedsa**, **rWmoneya**, **rWshopa**, **rWmealsa**, **rWmapa**, **rWhousewka**, **rWleavhsa**, and **rWlaundrya**, respectively. In addition to the special missing codes used in **rWphonea**, **rWmedsa**, **rWmoneya**, **rWshopa**, **rWmealsa**, **rWmapa**, **rWhousewka**, **rWleavhsa**, and **rWlaundrya**, **sWphonea**, **sWmedsa**, **sWmoneya**, **sWshopa**, **sWmealsa**, **sWmapa**, **sWhousewka**, **sWleavhsa**, and **sWlaundrya** employ the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Leaving the house alone and using transportation (**rWleavhsa**), and doing the laundry (**rWlaundrya**) become available starting in Wave 6.

Cross-Study Differences with the HRS

The Gateway Harmonized SHARE has **rWhousewka**, indicating if the respondent has any difficulty doing work around the house or the garden, **rWleavhsa**, indicating if the respondent has any difficulty leaving the house alone and accessing transportation, and **rWlaundrya**, indicating if the respondent has any difficulty doing laundry, which are not asked in the HRS.

How Constructed

These variables indicate difficulty with functional limitations other than ADLs and IADLs. The other functional limitations include walking 100 meters (**rWwalk100a**), sitting for about 2 hours (**rWsita**), getting up from a chair after sitting for long periods (**rWchaira**), climbing several flights of stairs without resting (**rWclimsa**), climbing one flight of stairs without resting (**rWclim1a**), lifting or carrying weights over 10 pounds/5 kilos (**rWlfta**), stooping, kneeling, or crouching (**rWstooa**), reaching arms above shoulder level (**rWarmsa**), pushing or pulling large objects (**rWpusha**), and picking up a small coin from the table (**rWdimea**).

A code of 0 indicates that the respondent did not report any problems with the activity. A code of 1 indicates that the respondent reported some difficulty with the activity. When respondents don't know, refuse to answer, or are missing, **rWwalk100a**, **rWsita**, **rWchaira**, **rWclimsa**, **rWclim1a**, **rWlfta**, **rWstooa**, **rWarmsa**, **rWpusha**, and **rWdimea** are assigned special missing values (.d), (.r), or (.m), respectively. **rWwalk100a**, **rWsita**, **rWchaira**, **rWclimsa**, **rWclim1a**, **rWlfta**, **rWstooa**, **rWarmsa**, **rWpusha**, and **rWdimea** are set to plain missing (.) for respondents who did not respond to the current wave.

sWwalk100a, **sWsita**, **sWchaira**, **sWclimsa**, **sWclim1a**, **sWlfta**, **sWstooa**, **sWarmsa**, **sWpusha**, and **sWdimea** indicate whether the respondent's spouse reported any difficulty with such activities and are taken directly from the spouse's **rWwalk100a**, **rWsita**, **rWchaira**, **rWclimsa**, **rWclim1a**, **rWlfta**, **rWstooa**, **rWarmsa**, **rWpusha**, and **rWdimea**, respectively. In addition to the special missing codes used in **rWwalk100a**, **rWsita**, **rWchaira**, **rWclimsa**, **rWclim1a**, **rWlfta**, **rWstooa**, **rWarmsa**, **rWpusha**, and **rWdimea**, **sWwalk100a**, **sWsita**, **sWchaira**, **sWclimsa**, **sWclim1a**, **sWlfta**, **sWstooa**, **sWarmsa**, **sWpusha**, and **sWdimea** employ the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

The HRS elicits walking ability by asking respondents whether they have difficulty walking several blocks (**rWwalksa**) and whether they have difficulty walking one block (**rWwalk1a**). This latter measure is roughly equivalent to the 100 meters distance used by SHARE (**rWwalk100a**).

Original SHARE Variables Used

Wave 1:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table

Wave 2:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table

Wave 4:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table

Wave 5:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table

Wave 6:

pho48d1	Difficulties: walking 100 metres
---------	----------------------------------

pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table

Wave 7:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table

Wave 8:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table

Wave 9:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table

How Constructed

Four activities of Daily Living (ADL) summaries are derived. One (**rWadlwa**) uses the ADLs proposed by Wallace and Herzog in the paper (Wallace and Herzog, 1995) to define an ADL summary: bath, dress, and eat. The second (**rWadla**) includes these ADLs and adds getting in/out of bed and walking across a room. The third (**rWadlfive**) includes the items in the three item summary and adds getting in/out of bed and using the toilet. The fourth (**rWadltot6**) includes all six ADLs asked about in the SHARE, specifically bathing, dressing, eating, getting in/out of bed, walking across a room, and using the toilet. In all waves the indicators of "some difficulty" are used to construct these measures, i.e., **rWwalkra**, **rWbeda**, **rWbatha**, **rWdressa**, **rWeata**, and **rWtoilta**. Each limitation adds one to the summary measure, that is:

$$\mathbf{rWadlwa} = \mathbf{rWbatha} + \mathbf{rWdressa} + \mathbf{rWeata}$$

rWadlwam is the number of ADL questions with missing values, ranging from 0 to 3. **rWadlwa** is calculated for all respondents who answered at least one of the ADL component questions, that is respondents with **rWadlwam** values of less than 3. **rWadlwaa** indicates whether the respondent experiences difficulties with any of the three ADL activities listed above, and is coded as 0 if they experience no difficulties with these activities, and is coded as 1 if they experience difficulty with at least one of these activities.

$$\mathbf{rWadla} = \mathbf{rWbatha} + \mathbf{rWdressa} + \mathbf{rWeata} + \mathbf{rWbeda} + \mathbf{rWwalkra}$$

rWadlam is the number of ADL questions with missing values, ranging from 0 to 5. **rWadlfive** is calculated for all respondents who answered at least one of the ADL component questions, that is respondents with **rWadlam** values of less than 5. **rWadlaa** indicates whether the respondent experiences difficulties with any of the five ADL activities listed above, and is coded as 0 if they experience no difficulties with these activities, and is coded as 1 if they experience difficulty with at least one of these activities.

$$\text{rWadlfive} = \text{rWbatha} + \text{rWdressa} + \text{rWeata} + \text{rWbeda} + \text{rWtoilta}$$

rWadlfivem is the number of ADL questions with missing values, ranging from 0 to 5. **rWadlfive** is calculated for all respondents who answered at least one of the ADL component questions, that is respondents with **rWadlfivem** values of less than 5. **rWadlfivea** indicates whether the respondent experiences difficulties with any of the five ADL activities listed above, and is coded as 0 if they experience no difficulties with these activities, and is coded as 1 if they experience difficulty with at least one of these activities.

$$\text{rWadltot6} = \text{rWbatha} + \text{rWdressa} + \text{rWeata} + \text{rWbeda} + \text{rWwalkra} + \text{rWtoilta}$$

rWadltot6m is the number of ADL questions with missing values, ranging from 0 to 6. **rWadltot6** is calculated for all respondents who answered at least one of the ADL component questions, that is respondents with **rWadltot6m** values of less than 6. **rWadltot6a** indicates whether the respondent experiences difficulties with any of the six ADL activities listed above, and is coded as 0 if they experience no difficulties with these activities, and is coded as 1 if they experience difficulty with at least one of these activities.

If all component variables have missing values, these summary variables take the don't know, refused, or missing values, (.d), (.r), (.m), respectively, of the component variables. These summary variables are assigned plain missing (.) if the respondent did not participate in the current wave.

sWadlwa, **sWadla**, **sWadlfive**, and **sWadltot6** are the respondent's spouse's summaries and are taken directly from the spouse's **rWadlwa**, **rWadla**, **rWadlfive**, and **rWadltot6**, respectively. In addition to the special missing codes employed by the respondent variables, the spouse variables employ two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

sWadlwam, **sWadlam**, **sWadlfivem**, and **sWadltot6m** are the respondent's spouse's number of missings from the summary scores and are taken directly from the spouse's values of **rWadlwam**, **rWadlam**, **rWadlfivem**, and **rWadltot6m**, respectively. In addition to the special missing codes employed by the respondent variables, the spouse variables employ two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

sWadlwaa, **sWadlaa**, **sWadlfivea**, and **sWadltot6a** indicate whether the respondent's spouse experience any difficulty with the summary groupings and are taken directly from the spouse's values of **rWadlwaa**, **rWadlaa**, **rWadlfivea**, and **rWadltot6a**, respectively. In addition to the special missing codes employed by the respondent variables, the spouse variables employ two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Please see "Activities of Daily Living (ADLs): Some difficulty" for a description of how the individual 0/1 indicators (**rWbatha**, **rWdressa**, **rWeata**, **rWbeda**, **rWwalkra**, and **rWtoilta**) are constructed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

The RAND HRS has **rWadlwa**, **rWadlwam**, **rWadla**, and **rWadlam**, which are comparable to the Gateway Harmonized SHARE. **rWadlfive**, **rWadlfivem**, **rWadlfivea**, **rWadltot_h**, **rWadltotm_h**, and **rWadltota_h** from the Harmonized HRS are comparable to the Gateway Harmonized SHARE.

How Constructed

Five Instrumental Activities of Daily Living (IADL) summaries are derived. One (**rWiadla**) summarizes the commonly used IADLs, using the phone, managing money, and taking medications. The second (**rWiadlfour**) summarizes managing money, taking medications, shopping for groceries and preparing hot meals. The third (**rWiadlza**) summarizes using the phone, managing money, taking medications, shopping for groceries and preparing hot meals. The fourth (**rWiadltot1_s**) summarizes seven IADLs, using the phone, managing money, taking medications, shopping for groceries, preparing hot meals, using a map, and doing housework. The fifth (**rWiadltot2_s**) summarizes nine IADLs, adding leaving the house and accessing transportation and doing laundry to the previous measure. All of these summary measures use the indicators of "some difficulty" described above. Each limitation adds one to the summary measure, that is:

$$rWiadla = rWphonea + rWmoneya + rWmedsa$$

rWiadlam is the number of IADL questions with missing values, ranging from 0 to 3. **rWiadla** is calculated for all respondents who answered at least one of the IADL component questions, that is respondents with a **rWiadlam** value of less than 3. **rWiadlaa** indicates whether the respondent experiences difficulties with any of the three IADL activities listed above, and is coded as 0 if they experience no difficulties with these activities, and is coded as 1 if they experience difficulty with at least one of these activities.

rWiadlfour = **rWmoneya** + **rWmedsa** + **rWshopa** + **rWmealsa**

rWiadlfourm is the number of IADL questions with missing values, ranging from 0 to 4. **rWiadlza** is calculated for all respondents who answered at least one of the IADL component questions, that is respondents with a **rWiadlfourm** value of less than 4. **rWiadlfoura** indicates whether the respondent experiences difficulties with any of the four IADL activities listed above, and is coded as 0 if they experience no difficulties with these activities, and is coded as 1 if they experience difficulty with at least one of these activities.

rWiadlza = **rWphonea** + **rWmoneya** + **rWmedsa** + **rWshopa** + **rWmealsa**

rWiadlzam is the number of IADL questions with missing values, ranging from 0 to 5. **rWiadlza** is calculated for all respondents who answered at least one of the IADL component questions, that is respondents with a **rWiadlzam** value of less than 5. **rWiadlzaa** indicates whether the respondent experiences difficulties with any of the five IADL activities listed above, and is coded as 0 if they experience no difficulties with these activities, and is coded as 1 if they experience difficulty with at least one of these activities.

rWiadltot1_s = **rWphonea** + **rWmoneya** + **rWmedsa** + **rWshopa** + **rWmealsa** + **rWhousewka** + **rWmapa**

rWiadltot1m_s is the number of IADL questions with missing values, ranging from 0 to 7. **rWiadltot1_s** is calculated for all respondents who answered at least one of the IADL component questions, that is respondents with a **rWiadltot1m_s** value of less than 7. **rWiadltot1a_s** indicates whether the respondent experiences difficulties with any of the seven IADL activities listed above, and is coded as 0 if they experience no difficulties with these activities, and is coded as 1 if they experience difficulty with at least one of these activities. There are two additional IADLs available starting in Wave 6, going out and using transportation and doing the laundry, that are not included in this summary score.

rWiadltot2_s = **rWphonea** + **rWmoneya** + **rWmedsa** + **rWshopa** + **rWmealsa** + **rWhousewka** + **rWmapa** + **rWleavhsa** + **rWlaundrya**

rWiadltot2m_s is the number of IADL questions with missing values, ranging from 0 to 9. **rWiadltot2_s** is calculated for all respondents who answered at least one of the IADL component questions, that is respondents with a **rWiadltot2m_s** value of less than 9. **rWiadltot2a_s** indicates whether the respondent experiences difficulties with any of the nine IADL activities listed above, and is coded as 0 if they experience no difficulties with these activities, and is coded as 1 if they experience difficulty with at least one of these activities. This measure is available beginning in wave 6, when difficulty with leaving the house and accessing transportation and doing the laundry are added.

If all component variables have missing values, these summary variables take the don't know, refused, or missing values, (.d), (.r), (.m), respectively, of the component variables. These summary variables are assigned plain missing (.) if the respondent did not participate in the current wave.

sWiadla, **sWiadlfour**, **sWiadlza**, **sWiadltot1_s** and **sWiadltot2_s** are the respondent's spouse's summaries and are taken directly from the spouse's **rWiadla**, **rWiadlfour**, **rWiadlza**, **rWiadltot1_s** and **rWiadltot2_s**, respectively. In addition to the special missing codes employed by the respondent variables, the spouse variables employ two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

sWiadlam, **sWiadlfourm**, **sWiadlzam**, **sWiadltot1m_s**, and **sWiadltot2m_s** are the respondent's spouse's count of missings from the summary scores are taken directly from the spouse's values of **rWiadlam**, **rWiadlfourm**, **rWiadlzam**, **rWiadltot1m_s**, and **rWiadltot2m_s**, respectively. In addition to the special missing codes employed by the respondent variables, the spouse variables employ two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

sWiadlaa, **sWiadlfoura**, **sWiadlzaa**, **sWiadltot1a_s** and **sWiadltot2a_s** indicate whether the respondent's spouse experiences any difficulty with the summary grouping and are taken directly from the spouse's values of **rWiadlaa**, **rWiadlfoura**, **rWiadlzaa**, **rWiadltot1a_s** and **rWiadltot2a_s**, respectively. In addition to the special missing codes employed by the respondent variables, the spouse variables employ two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Please see "Instrumental Activities of Daily Living (IADLs): Some difficulty" for a description of how the individual o/1 indicators (**rWphonea**, **rWmoneya**, **rWmedsa**, **rWshopa**, **rWmealsa**, **rWhousewka**, **rWmapa**, **rWleavhsa**, and **rWlaundrya**) are constructed.

Cross Wave Differences in SHARE

Difficulty leaving the house alone and accessing transportation and doing laundry are asked beginning in Wave 6, as such, **rWiadltot2_s**, **rWiadltot2m_s**, and **rWiadltot2a_s** are available starting in Wave 6.

Cross-Study Differences with the HRS

rWiadla, **rWiadlam**, **rWiadlza**, and **rWiadlzam** are available in the RAND HRS, which are comparable to those found in the Gateway Harmonized SHARE. **rWiadlfour**, **rWiadlfourm**, and **rWiadlfoura** are available in the Harmonized HRS, which are comparable to those found in the Gateway Harmonized SHARE. The HRS does not ask about difficulty with housework, leaving the house alone and accessing transportation, or doing laundry.

How Constructed

Several summary measures for functional limitations are created. These include 4 and 7 item mobility indices, large muscle, gross and fine motor, upper and lower body summaries, as well as NAGI summaries. Besides the ADL and IADL summary measures described above, Wallace and Herzog, 1995 also use mobility and large muscle indices.

The 4 item mobility index uses the walking 100 meters, walking across a room, climbing one flight of stairs, and climbing several flights of stairs activities. The 7 item mobility index uses the walking 100 meters, climbing several flights of stairs, getting up from a chair, stooping, lifting 10 pounds, extending arms up, and picking up a small coin activities. The large muscle index uses the sitting for 2 hours, getting up from a chair, stooping, kneeling or crouching, and pushing or pulling large objects activities. The gross motor index uses the walking 100 meters, walking across a room, climbing one flight of stairs, getting in or out of bed, and bathing activities. The fine motor index uses the picking up a small coin, eating, and dressing activities. The lower body index uses the walking 100 meters, climbing several flights of stairs, getting up from a chair, and stooping activities. The upper body index uses the lifting 10 pounds, extending arms up, and picking up a small coin activities. The 10 item NAGI score summary uses the walking 100 meters, sitting for 2 hours, getting up from a chair, climbing one flight of stairs, and climbing several flights of stairs activities, stooping activities, extending arms up, pushing or pulling large objects activities, and picking up a small coin activities. The 8 item NAGI score summary uses the walking 100 meters, sitting for 2 hours, getting up from a chair, stooping activities, extending arms up, pushing or pulling large objects activities, and picking up a small coin activities. In all waves, the indicators of "some difficulty" are used to construct these measures. Each limitation adds one to the summary measure, that is:

$$rWmobilb = rWwalk100a + rWwalkra + rWclimsa + rWclim1a$$

rWmobilbm is the number of mobility questions with missing values, ranging from 0 to 4. **rWmobilb** is calculated for all respondents who answered at least one of the mobility component questions, that is respondents with **rWmobilbm** values of

less than 4. **rWmobilba** indicates whether the respondent experiences difficulties with any of the four activities listed above, and is coded as 0 if the respondent experiences no difficulties with any of the activities and is coded as 1 if the respondent experiences difficulties with at least one of the activities.

$$\mathbf{rWmobilsev} = \mathbf{rWwalk100a} + \mathbf{rWclimsa} + \mathbf{rWchaira} + \mathbf{rWstoopa} + \mathbf{rWarmasa} + \mathbf{rWlifta} + \mathbf{rWdimea}$$

rWmobilsevm is the number of mobility questions with missing values, ranging from 0 to 7. **rWmobilsev** is calculated for all respondents who answered at least one of the mobility component questions, that is respondents with **rWmobilsevm** values of less than 7. **rWmobilseva** indicates whether the respondent experiences difficulties with any of the seven activities listed above, and is coded as 0 if the respondent experiences no difficulties with any of the activities and is coded as 1 if the respondent experiences difficulties with at least one of the activities.

$$\mathbf{rWlgmusa} = \mathbf{rWsita} + \mathbf{rWchaira} + \mathbf{rWstoopa} + \mathbf{rWpusha}$$

rWlgmusam is the number of large muscle questions with missing values, ranging from 0 to 4. **rWlgmusa** is calculated for all respondents who answered at least one of the large muscle component questions, that is respondents with **rWlgmusam** values of less than 4. **rWlgmusaa** indicates whether the respondent experiences difficulties with any of the four activities listed above, and is coded as 0 if the respondent experiences no difficulties with any of the activities and is coded as 1 if the respondent experiences difficulties with at least one of the activities.

$$\mathbf{rWgrossa} = \mathbf{rWwalk100a} + \mathbf{rWwalkra} + \mathbf{rWclim1a} + \mathbf{rWbeda} + \mathbf{rWbatha}$$

rWgrossam is the number of gross motor questions with missing values, ranging from 0 to 5. **rWgrossa** is calculated for all respondents who answered at least one of the gross motor component questions, that is respondents with **rWgrossam** values of less than 5. **rWgrossaa** indicates whether the respondent experiences difficulties with any of the five activities listed above, and is coded as 0 if the respondent experiences no difficulties with any of the activities and is coded as 1 if the respondent experiences difficulties with at least one of the activities.

$$\mathbf{rWfinea} = \mathbf{rWdimea} + \mathbf{rWeata} + \mathbf{rWdressa}$$

rWfineam is the number of fine motor questions with missing values, ranging from 0 to 3. **rWfinea** is calculated for all respondents who answered at least one of the fine motor component questions, that is respondents with **rWfineam** value of less than 3. **rWfineaa** indicates whether the respondent experiences difficulties with any of the three activities listed above, and is coded as 0 if the respondent experiences no difficulties with any of the activities and is coded as 1 if the respondent experiences difficulties with at least one of the activities.

$$\mathbf{rWlowermob} = \mathbf{rWwalk100a} + \mathbf{rWclimsa} + \mathbf{rWchaira} + \mathbf{rWstoopa}$$

rWlowermobm is the number of lower body mobility questions with missing values, ranging from 0 to 4. **rWlowermob** is calculated for all respondents who answered at least one of the lower body mobility component questions, that is respondents with **rWlowermobm** values of less than 4. **rWlowermoba** indicates whether the respondent experiences difficulties with any of the four activities listed above, and is coded as 0 if the respondent experiences no difficulties with any of the activities and is coded as 1 if the respondent experiences difficulties with at least one of the activities.

$$\mathbf{rWuppermob} = \mathbf{rWarmasa} + \mathbf{rWlifta} + \mathbf{rWdimea}$$

rWuppermobm is the number of upper body mobility questions with missing values, ranging from 0 to 3. **rWuppermob** is calculated for all respondents who answered at least one of the upper body mobility component questions, that is respondents with **rWuppermobm** values of less than 3. **rWuppermoba** indicates whether the respondent experiences difficulties with any of the three activities listed above, and is coded as 0 if the respondent experiences no difficulties with any of the activities and is coded as 1 if the respondent experiences difficulties with at least one of the activities.

$$\mathbf{rWnagi10} = \mathbf{rWwalk100a} + \mathbf{rWsita} + \mathbf{rWchaira} + \mathbf{rWclimsa} + \mathbf{rWclim1a} + \mathbf{rWstoopa} + \mathbf{rWarmasa} + \mathbf{rWpusha} + \mathbf{rWlifta} + \mathbf{rWdimea}$$

rWnagi10 is 10-item summary of any difficulty with mobility activities, ranging from 0 to 10. **rWnagi10** is calculated for all respondents who answered at least one of the NAGI item component questions, that is respondents with **rWnagi10m** values of less than 10. **rWnagi10a** indicates whether the respondent experiences difficulties with any of the ten activities

listed above, and is coded as 0 if the respondent experiences no difficulties with any of the activities and is coded as 1 if the respondent experiences difficulties with at least one of the activities.

$rWnagi8 = rWwalk100a + rWsita + rWchaira + rWstooa + rWarmasa + rWpusha + rWlifter + rWdime$

rWnagi8 is 8-item summary of any difficulty with mobility activities, ranging from 0 to 8. **rWnagi8** is calculated for all respondents who answered at least one of the NAGI item component questions, that is respondents with **rWnagi8m** values of less than 8. **rWnagi8a** indicates whether the respondent experiences difficulties with any of the eight activities listed above, and is coded as 0 if the respondent experiences no difficulties with any of the activities and is coded as 1 if the respondent experiences difficulties with at least one of the activities.

If all component variables have missing values, these summary variables take the don't know, refused, or missing values, (.d), (.r), (.m), respectively, of the component variables. These summary variables are assigned plain missing (.) if the respondent did not participate in the current wave.

sWmobilb, **sWmobilsev**, **sWlgmusa**, **sWgrossa**, **sWfinea**, **sWlowermob**, **sWnagi10**, and **sWnagi8** are the respondent's spouse's indices and are taken directly from the spouse's **rWmobilb**, **rWmobilsev**, **rWlgmusa**, **rWgrossa**, **rWfinea**, **rWlowermob**, **rWuppermob**, **rWnagi10**, and **rWnagi8**, respectively. In addition to the special missing values employed by the respondent variables, the spouse variables employ two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

sWmobilbm, **sWmobilsevm**, **sWlgmusam**, **sWgrossam**, **sWfineam**, **sWlowermobm**, **sWuppermobm**, **sWnagi10m**, and **sWnagi8m** are counts of the respondent's spouse's missings from the indices and are taken directly from the spouse's values of **rWmobilbm**, **rWmobilsevm**, **rWlgmusam**, **rWgrossam**, **rWfineam**, **rWlowermobm**, **rWuppermobm**, **rWnagi10m**, and **rWnagi8m**, respectively. In addition to the special missing values employed by the respondent variables, the spouse variables employ two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

sWmobilba, **sWmobilseva**, **sWlgmusaa**, **sWgrossaa**, **sWfineaa**, **sWlowermoba**, **sWuppermoba**, **sWnagi10a**, and **sWnagi8a** are indicators of the respondent's spouse having any difficulty from the indices and are taken directly from the spouse's values of **rWmobilba**, **rWmobilseva**, **rWlgmusaa**, **rWgrossaa**, **rWfineaa**, **rWlowermoba**, **rWuppermoba**, **rWnagi10a**, and **rWnagi8a**, respectively. In addition to the special missing values employed by the respondent variables, the spouse variables employ two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Please see "Activities of Daily Living (ADLs): Some difficulty" for a description of how the individual 0/1 indicators (**rWwalkra**, **rWbeda**, **rWbatha**, **rWeata**, and **rWdressa**) are constructed. See "Other Functional Limitations: Some difficulty" for a description of how the individual 0/1 indicators (**rWwalk100a**, **rWclimsa**, **rWclim1a**, **rWsita**, **rWchaira**, **rWstooa**, **rWpusha**, **rWarmasa**, **rWlifter**, and **rWdime**) are constructed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

The RAND HRS includes **rWmobila**, **rWlgmusa**, **rWgrossa**, and **rWfinea**, which are largely comparable to those included in the Gateway Harmonized SHARE. The Harmonized HRS includes **rWmobilsev**, **rWmobilsevm**, **rWmobilseva**, **rWlowermob**, **rWlowermobm**, **rWlowermoba**, **rWuppermob**, **rWuppermobm**, **rWuppermoba**, **rWnagi10**, **rWnagi10m**, **rWnagi10a**, **rWnagi8**, **rWnagi8m**, and **rWnagi8a** which are largely comparable to those included in the Gateway Harmonized SHARE. Please see the following paragraph for any differences.

The HRS surveys difficulty walking by means of three questions eliciting difficulty walking across a room, difficulty walking one block, and difficulty walking several blocks. The SHARE only uses two questions to survey walking difficulty referring to difficulty walking across a room and difficulty walking 100 meters. This difference affects six of the summary indices. Specifically, **rWmobilb** has a scale of 0-4 in the Gateway Harmonized SHARE, whereas **rWmobila** in the RAND HRS has a 0-5 scale. Also, in the Gateway Harmonized SHARE, **rWgrossa**, **rWmobilsev**, **rWlowermob**, **rWnagi10**, and **rWnagi8** employ an indicator of whether the respondent has difficulty walking 100 meters, whereas **rWgrossa** in the RAND HRS and **rWmobilsev** and **rWlowermob**, **rWnagi10**, and **rWnagi8** in the Harmonized HRS use an indicator of whether the respondent has difficulty walking one block.

The missing counts and any difficulty indicators available in the Gateway Harmonized SHARE (**rWmobilbm**, **rWmobilba**, **rWlgmusam**, **rWlgmusaa**, **rWgrossam**, **rWgrossaa**, **rWfineam**, **rWfineaa**) are not available in the RAND HRS, though comparable measures could be created.

Continuous Variable Distributions

Original SHARE Variables Used

Wave 1:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table
pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed

Wave 2:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table
pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed

Wave 4:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours

pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table
pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed

Wave 5:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table
pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed

Wave 6:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table
pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed

Wave 7:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder

pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table
pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed

Wave 8:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table
pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed

Wave 9:

pho48d1	Difficulties: walking 100 metres
pho48d2	Difficulties: sitting two hours
pho48d3	Difficulties: getting up from chair
pho48d4	Difficulties: climbing several flights of stairs
pho48d5	Difficulties: climbing one flight of stairs
pho48d6	Difficulties: stooping, kneeling, crouching
pho48d7	Difficulties: reaching or extending arms above shoulder
pho48d8	Difficulties: pulling or pushing large objects
pho48d9	Difficulties: lifting or carrying weights over 5 kilos
pho48d10	Difficulties: picking up a small coin from a table
pho49d1	Difficulties: dressing, including shoes and socks
pho49d2	Difficulties: walking across a room
pho49d3	Difficulties: bathing or showering
pho49d4	Difficulties: eating, cutting up food
pho49d5	Difficulties: getting in or out of bed

How Constructed

rWhibpe, **rWdiabe**, **rWcancr**, **rWlunge**, **rWhearte**, **rWstroke**, **rWarthre**, **rWpsyche**, **rWasthmae**, **rWrespe**, **rWosteo**, **rWhchole**, **rWparkine**, **rWcatracte**, **rWhipe**, **rWulcere**, and **rWkidneye** indicate whether or not a doctor has ever told the respondent they had or currently have these conditions. A code of 0 indicates that the respondent does not report having been told by a doctor they have the condition. A code of 1 indicates that the respondent reports having been told by a doctor they have the condition. When respondents don't know, refuse to answer, or have missing responses, **rWhibpe**, **rWdiabe**, **rWcancr**, **rWlunge**, **rWhearte**, **rWstroke**, **rWarthre**, **rWpsyche**, **rWasthmae**, **rWrespe**, **rWosteo**, **rWhchole**, **rWparkine**, **rWcatracte**, **rWhipe**, **rWulcere**, and **rWkidneye** are assigned special missing values (.d), (.r), or (.m), respectively. These variables are set to plain missing (.) for respondents who did not respond to the current wave.

rWhibpe indicates whether a doctor has told the respondent they had or currently have high blood pressure or hypertension. **rWdiabe** indicates whether a doctor has told the respondent they had or currently have diabetes or high blood sugar. **rWcancr** indicates whether a doctor has told the respondent they had or currently have cancer or a malignant tumor, including leukemia or lymphoma, but excluding minor skin cancers. **rWlunge** indicates whether a doctor has told the respondent they had or currently have chronic lung disease such as chronic bronchitis or emphysema. **rWhearte** indicates whether a doctor has told the respondent they had or currently have a heart attack, including myocardial infarction or coronary thrombosis, or any other heart problem, including congestive heart failure. **rWstroke** indicates whether a doctor has told the respondent they had or currently have a stroke or cerebral vascular disease. **rWarthre** indicates whether a doctor has told the respondent they had or currently have arthritis, including osteoarthritis or rheumatism. **rWpsyche** indicates whether a doctor has told the respondent they had or currently have affective or emotional disorders, including anxiety, nervous or psychiatric problems. **rWasthmae** indicates whether a doctor has told the respondent they had or currently have asthma. **rWrespe** indicates whether a doctor has told the respondent they had or currently have chronic lung disease or asthma, and summarizes the information provided in **rWlunge** and **rWasthmae**. **rWosteo** indicates whether a doctor has told the respondent they had or currently have osteoporosis. **rWhchole** indicates whether a doctor has told the respondent they had or currently have high blood cholesterol. **rWparkine** indicates whether a doctor has told the respondent they had or currently have Parkinson disease. **rWcatracte** indicates whether a doctor has told the respondent they had or currently have cataracts. **rWhipe** indicates whether a doctor has told the respondent they had or currently have a hip fracture or a femoral fracture in Waves 1, 2, and 4, and a hip fracture only starting in Wave 5. **rWulcere** indicates whether a doctor has told the respondent they had or currently have a stomach or duodenal ulcer, or peptic ulcer. **rWkidneye** indicates whether a doctor has told the respondent they had or currently have kidney disease.

For all conditions except psychiatric disorders, in the respondent's first survey respondents are asked whether they have ever had the condition and then in all follow up surveys they are asked whether they currently have the condition. Previous reports (both the first ever report and all following current reports) are fed-forward to derive **rWhibpe**, **rWdiabe**, **rWcancr**, **rWlunge**, **rWhearte**, **rWstroke**, **rWarthre**, **rWasthmae**, **rWrespe**, **rWosteo**, **rWhchole**, **rWparkine**, **rWcatracte**, **rWhipe**, **rWulcere**, and **rWkidneye**. For cancer, heart attacks, strokes, and hip or femoral fractures, respondents are also asked whether they have had the condition since the last interview (as opposed to currently), and these positive reports are incorporated into **rWcancr**, **rWhearte**, **rWstroke**, and **rWhipe**. For these four conditions, if the respondent reports they have had the condition since the last interview and in the last interview they reported having the condition also, the respondent is asked whether they had already had the condition before the last interview, allowing the respondents to dispute their previous report. Disputes of previous reports are fed back to correct the previous report in **rWcancr**, **rWhearte**, **rWstroke**, and **rWhipe**.

In Waves 2 and 4, all respondents are asked whether they have ever been diagnosed with a psychiatric disorder. Therefore, **rWpsyche** in Waves 2 and 4 is derived from these ever reports without feeding forward previous reports. Starting in Wave 5, if it is the respondent's first interview they are asked whether they have ever had the condition, but if the respondent has been interviewed before as part of a previous wave, then they are asked whether they currently have the condition. Previous reports (both the first ever reports from Wave 2 and 4 and all following current reports) are fed-forward to derive **rWpsyche**. In the case that there is disagreement between the Wave 2 and Wave 4 ever been diagnosed reports where the respondent

reports ever having been diagnosed in Wave 2 but then in Wave 4 the respondent reports never having been diagnosed, the respondent is considered to have ever been diagnosed for the purposes of deriving **rWpsyche** in Wave 5 and forward.

In Wave 4, only respondents in Austria, Netherlands, and Belgium are asked about being diagnosed with asthma or osteoporosis. Respondents in all other countries in this wave are assigned special missing (.q) to **rWashtmae**, **rWrespe** and **rWosteo**. Starting in Wave 5, asthma and osteoporosis are no longer asked about in any country. As a result, **rWrespe** takes special missing value (.q) if the respondent does not have a chronic lung condition and was not asked about having asthma, and is no longer available starting in Wave 5. Starting in Wave 5, respondents are asked if they have ever had rheumatoid arthritis or osteoarthritis/other rheumatism as separate questions. **rWarthre** is coded as 1 if the respondent indicates having had at least one of the conditions. Starting in Wave 6, respondents are asked if they have ever had chronic kidney disease.

sWhibpe, **sWdiabe**, **sWcancre**, **sWlunge**, **sWhearte**, **sWstroke**, **sWarthre**, **sWpsyche**, **sWasthmae**, **sWrespe**, **sWosteo**, **sWhchole**, **sWparkine**, **sWcatracte**, **sWhipe**, **sWulcere**, and **sWkidneye** indicate whether the respondent's spouse reported ever being told by a doctor they have any of these conditions described above and are taken directly from the spouse's **rWhibpe**, **rWdiabe**, **rWcancre**, **rWlunge**, **rWhearte**, **rWstroke**, **rWarthre**, **rWpsyche**, **rWasthmae**, **rWrespe**, **rWosteo**, **rWhchole**, **rWparkine**, **rWcatracte**, **rWhipe**, **rWulcere**, and **rWkidneye**, respectively. In addition to the special missing codes used in **rWhibpe**, **rWdiabe**, **rWcancre**, **rWlunge**, **rWhearte**, **rWstroke**, **rWarthre**, **rWpsyche**, **rWasthmae**, **rWrespe**, **rWosteo**, **rWhchole**, **rWparkine**, **rWcatracte**, **rWhipe**, **rWulcere**, and **rWkidneye**; **sWhibpe**, **sWhibpe**, **sWdiabe**, **sWcancre**, **sWlunge**, **sWhearte**, **sWstroke**, **sWarthre**, **sWpsyche**, **sWasthmae**, **sWrespe**, **sWosteo**, **sWhchole**, **sWparkine**, **sWcatracte**, **sWhipe**, **sWulcere**, and **sWkidneye** employ two other missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWcancrf, **rWheartf**, **rWstrokf**, and **rWhipf** indicate whether a condition is disputed at the current interview or a later interview. These flag variables differentiate between instances where the respondent disputed a condition which they had previously reported and instances where the respondent was asked to dispute a condition they had never reported (a mistake in the preloaded condition). The codes for the flag variables are: 0) no dispute and no change; 2) disputes preloaded condition indicating prior report of condition, and data agree with preloaded condition, set prior waves to no; 3) disputes preloaded condition indicating prior report of condition, and data show no prior report of condition; 5) dispute of preloaded condition at a later wave has changed this wave's report from yes to no; 6) dispute of preloaded condition at a later wave has not changed this wave's report as the report was already no. Starting in Wave 6, respondents are not given the opportunity to dispute their previous reports, so **rWcancrf**, **rWheartf**, **rWstrokf**, and **rWhipf** are not available.

sWcancrf, **sWheartf**, **sWstrokf**, and **sWhipf** are taken directly from the spouse's responses to **rWcancrf**, **rWheartf**, **rWstrokf**, and **rWhipf**, respectively. Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

For all conditions except psychiatric disorders, in the respondent's first wave they are asked whether they have ever had the condition and then in all follow up waves they are asked whether they currently have the condition. Previous reports (both the first ever report and all following current reports) are fed-forward to derive **rWhibpe**, **rWdiabe**, **rWcancre**, **rWlunge**, **rWhearte**, **rWstroke**, **rWarthre**, **rWasthmae**, **rWrespe**, **rWosteo**, **rWhchole**, **rWparkine**, **rWcatracte**, **rWhipe**, **rWulcere**, and **rWkidneye**.

Starting in Wave 2, respondents are also asked whether they have had a heart attack, had a stroke or been diagnosed with cerebral vascular disease, been diagnosed with cancer, or suffered a hip fracture since the last interview, and these positive reports are incorporated into **rWcancre**, **rWhearte**, **rWstroke**, and **rWhipe**. Also starting in Wave 2, if the respondent reports they have had the condition since the last interview and in the last interview they reported having the condition, the respondent is asked whether they had already had the condition before the last interview, allowing the respondents to dispute their previous report. Disputes of previous reports are fed back to correct the previous report in **rWcancrf**, **rWhearte**, **rWstroke**, and **rWhipf**. These disputes are flagged with **rWcancrf**, **rWheartf**, **rWstrokf**, and **rWhipf**.

Psychiatric disorders are not asked about in Wave 1. In Waves 2 and 4, all respondents are asked whether they have ever been diagnosed with a psychiatric disorder. Therefore in these waves, **rWpsyche** is derived from these ever reports without feeding forward previous reports. Starting in Wave 5 if it is the respondent's first interview they are asked whether they have ever had a psychiatric disorder but if the respondent has been interviewed before as part of a previous wave then they are asked whether they currently have a psychiatric disorder. Previous reports (both the first ever reports from Wave 2 and 4 and all following current reports) are fed-forward to derive **rWpsyche**. In the case that there is disagreement between the Wave 2 and Wave 4 ever had a psychiatric disorder reports where the respondent reports ever having had one in Wave 2 but then in Wave 4 the respondent reports never having had one, the respondent is considered to have ever had a psychiatric disorder for the purposes of deriving **rWpsyche** in Wave 5 and forward.

Asthma and osteoporosis are asked about in all countries in Waves 1 and 2. In Wave 4, asthma and osteoporosis are only asked about in Austria, Netherlands, and Belgium. They are no longer asked about starting in Wave 5.

In Waves 1, 2, and 4, the respondent is asked about hip or femoral fractures, but starting in Wave 5, the respondent is asked about hip fractures only.

Starting in Wave 5, respondents are asked if they have ever had rheumatoid arthritis or osteoarthritis/other rheumatism, as separate questions. **rWarthre** is coded as 1 if the respondent indicates having had at least one of the conditions.

Starting in Wave 6, the **rWcancrf**, **rWheartf**, **rWstrokf**, **rWhipf**, **sWcancrf**, **sWheartf**, **sWstrokf**, and **sWhipf** dispute flags are not defined and previous waves of these flags are not updated because the questions that were used to define these flags were not asked starting in Wave 6.

Starting in Wave 6, respondents are asked if they have ever had chronic kidney disease (**rWkidneye**).

Cross-Study Differences with the HRS

In follow-up interviews in the HRS, respondents are read a statement containing all conditions they reported at prior waves. Respondents are able to dispute any incorrect reports. In follow-up surveys in the SHARE, respondents are only asked to dispute previous reports for cancer, heart attacks, stroke, and hip fracture and only if they report having had those since the last interview. SHARE does not allow for a respondent to dispute any other condition.

rWhipe in the Harmonized HRS only indicates whether the respondent has ever had a hip fracture, whereas in some waves of the Gateway Harmonized SHARE, **rWhipe** indicates whether the respondent has ever had a hip or femoral fracture.

The RAND HRS and Harmonized HRS do not have variables comparable to **rWparkine**, **rWcatracte**, and **rWkidneye**. The HRS asks respondents if they have been diagnosed with osteoporosis starting in 2012 and with high blood cholesterol starting in 2014, which have been made available in **rWosteoe** and **rWhchole** in the Harmonized HRS. The HRS asks respondents if they have suffered a hip fracture, but not a hip or femoral fracture as in SHARE, which is available as **rWhipe** in the Harmonized HRS. The HRS also asks respondents if they have had cataract surgery (**rWcatrcte** in the Harmonized HRS), but not directly whether they have been diagnosed with cataracts, so an accurate ever diagnosed variable cannot be created for cataracts. The HRS does not ask respondents if they have been diagnosed with Parkinson's disease. The HRS asks respondents if they have been diagnosed with kidney disease only in 2016, so a comparable measure can be created for this wave only.

Diagnosed Since Last Wave

Variable	Waves	Label	Type
rWhrtatt	2, 4-9	rWhrtatt:ww R reports heart attack since last wave	Categ
sWhrtatt	2, 4-9	sWhrtatt:ww S reports heart attack since last wave	Categ
rWstrok	2, 4-9	rWstrok:ww R reports stroke since last wave	Categ
sWstrok	2, 4-9	sWstrok:ww S reports stroke since last wave	Categ
rWcancr	2, 4-9	rWcancr:ww R reports cancer since last wave	Categ
sWcancr	2, 4-9	sWcancr:ww S reports cancer since last wave	Categ
rWhip	2, 4-9	rWhip:ww R reports hip fracture since last wave	Categ
sWhip	2, 4-9	sWhip:ww S reports hip fracture since last wave	Categ

How Constructed

rWhrtatt, **rWstrok**, **rWcancr**, and **rWhip** indicate whether the respondent reports being diagnosed with a specified condition since their last interview. The respondent is asked whether they have been diagnosed with the condition since their last interview, regardless of whether or not they report having ever been diagnosed with the condition in the previous questions. **rWhrtatt** indicates whether the respondent reports having a heart attack. **rWstrok** indicates whether the respondent reports having a stroke or being diagnosed with cerebral vascular disease. **rWcancr** indicates whether the respondent reports being diagnosed with cancer. **rWhip** indicates whether the respondent reports suffering a hip fracture. These variables are assigned a 0 if the respondent does not report having the diagnosis since the last interview, and are assigned a 1 if the respondent reports being diagnosed since the last interview. Respondents are not asked these questions if it is their baseline interview, in which case these variables are assigned special missing (.b). Participants in the SHARELIFE Wave 7 questionnaire are not asked these questions and are assigned special missing value (.c). Don't know, refuse, or otherwise missing responses are assigned special missing values (.d), (.r), or (.m), respectively. **rWhrtatt**, **rWstrok**, **rWcancr**, and **rWhip** is set to plain missing (.) for respondents who did not respond to the current wave.

sWhrtatt, **sWstrok**, **sWcancr**, and **sWhip** indicate whether the respondent's spouse reports being diagnosed with a specified condition since their last interview, and their values are taken directly from the spouse's **sWhrtatt**, **sWstrok**, **sWcancr**, and **sWhip**. In addition to the special missing codes used in **rWhrtatt**, **rWstrok**, **rWcancr**, and **rWhip**, **sWhrtatt**, **sWstrok**, **sWcancr**, and **sWhip** employ two other missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

These questions are not included in Wave 1, but are asked starting in Wave 2.

In Wave 7 questions about being diagnosed with a specified condition since their last interview were not asked to respondents who answered the Wave 7 SHARELIFE questionnaire.

Cross-Study Differences with the HRS

The Harmonized HRS has **rWhrtatt**, indicating if the respondent had a heart attack since the previous interview, which is comparable to **rWhrtatt** in the Gateway Harmonized SHARE. Unlike SHARE, HRS respondents are only asked this question if they report ever having heart problems, whereas all re-interviewed SHARE respondents are asked this question. There are no comparable variables to **rWstrok**, **rWcancr**, and **rWhip** in any HRS datasets.

How Constructed

The following variables indicate the age at which the respondent was first diagnosed with a specified health condition. For all variables, if the respondent reports a new diagnosis after their first interview, they are not asked the age at which they were diagnosed, and the variable is assigned special missing (.s). All variables are assigned special missing (.c) in Wave 7 if the respondent has been diagnosed with the condition but is not asked the age at which they were diagnosed because they were given the condensed core interview and the life history interview in this wave. For all variables, if the given age is greater than the respondent's age in the current interview year, then the variable is assigned special missing value (.i). Please note that there may be extreme values for some of these variables, which have been left to the discretion of the user. Please also

note that if the respondent disputes their diagnosis of heart attack, stroke, cancer, or broken hip after having reported an age at diagnosis, then the ever diagnosed variable is adjusted, but the age at diagnosis variable is left as reported.

radiaghibp indicates the age at which the respondent was first diagnosed with high blood pressure. Respondents who have never been diagnosed with high blood pressure are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with high blood pressure is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiaghibp** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiaghibp indicates the age at which the respondent's current wave's spouse was first diagnosed with high blood pressure, and is taken from **radiaghibp**. In addition to the special missing codes employed by **radiaghibp**, **sWdiaghibp** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagdiab indicates the age at which the respondent was first diagnosed with diabetes. Respondents who have never been diagnosed with diabetes are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with diabetes is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiagdiab** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiagdiab indicates the age at which the respondent's current wave's spouse was first diagnosed with diabetes, and is taken from **radiagdiab**. In addition to the special missing codes employed by **radiagdiab**, **sWdiagdiab** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagcancr indicates the age at which the respondent was first diagnosed with cancer. If the age first diagnosed with cancer is provided in multiple waves, the first provided age is used. Respondents who have never been diagnosed with cancer are not asked this question and are assigned a special missing code (.x). Don't know, refused, or other missing responses of **radiagcancr** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiagcancr indicates the age at which the respondent's current wave's spouse was diagnosed with cancer, and is taken from **radiagcancr**. In addition to the special missing codes employed by **radiagcancr**, **sWdiagcancr** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiaglun indicates the age at which the respondent was first diagnosed with lung disease. Respondents who have never been diagnosed with lung disease are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with lung disease is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiaglun** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiaglun indicates the age at which the respondent's current wave's spouse was first diagnosed with lung disease, and is taken from **radiaglun**. In addition to the special missing codes employed by **radiaglun**, **sWdiaglun** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagheart indicates the age at which the respondent was first diagnosed with heart disease. Respondents who have never been diagnosed with heart disease are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with heart disease is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiagheart** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiagheart indicates the age at which the respondent's current wave's spouse was first diagnosed with heart disease, and is taken from **radiagheart**. In addition to the special missing codes employed by **radiagheart**, **sWdiagheart** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagstrok indicates the age at which the respondent was first diagnosed with having a stroke. Respondents who have never been diagnosed with having a stroke are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with a stroke is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiagstrok** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiagstrok indicates the age at which the respondent's current wave's spouse was first diagnosed with having a stroke, and is taken from **radiagstrok**. In addition to the special missing codes employed by **radiagstrok**, **sWdiagstrok** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagarthr indicates the age at which the respondent was first diagnosed with arthritis. In Waves 1, 2, and 4, the **radiagarthr** indicates the age the respondent was first diagnosed with arthritis or rheumatism, asked in a single question. Starting in Wave 5, **radiagarthr** indicates the age at which the respondent was first diagnosed with either rheumatoid arthritis, or with osteoarthritis or other rheumatism, asked in two questions. If the respondent reports an age for both, the minimum age is used. Respondents who have never been diagnosed with arthritis are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with arthritis is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiagarthr** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiagarthr indicates the age at which the respondent's current wave's spouse was first diagnosed with arthritis, and is taken from **radiagarthr**. In addition to the special missing codes employed by **radiagarthr**, **sWdiagarthr** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiaghchol indicates the age at which the respondent was first diagnosed with high cholesterol. Respondents who have never been diagnosed with high cholesterol are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with high cholesterol is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiaghchol** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiaghchol indicates the age at which the respondent's current wave's spouse was first diagnosed with high cholesterol, and is taken from **radiaghchol**. In addition to the special missing codes employed by **radiaghchol**, **sWdiaghchol** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagparkin indicates the age at which the respondent was first diagnosed with Parkinson's disease. Respondents who have never been diagnosed with Parkinson's disease are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with Parkinson's disease is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiagparkin** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiagparkin indicates the age at which the respondent's current wave's spouse was first diagnosed with Parkinson's disease, and is taken from **radiagparkin**. In addition to the special missing codes employed by **radiagparkin**, **sWdiagparkin** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagcatrct indicates the age at which the respondent was first diagnosed with having cataracts. Respondents who have never been diagnosed with having cataracts are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with having cataracts is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiagcatrct** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiagcatrct indicates the age at which the respondent's current wave's spouse was first diagnosed with having cataracts, and is taken from **radiagcatrct**. In addition to the special missing codes employed by **radiagcatrct**, **sWdiagcatrct** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report

being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiaghip indicates the age at which the respondent was first diagnosed with a hip or femoral fracture. Respondents who have never been diagnosed with a hip fracture are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with a hip fracture is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiaghip** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiaghip indicates the age at which the respondent's current wave's spouse was first diagnosed with a hip fracture, and is taken from **radiaghip**. In addition to the special missing codes employed by **radiaghip**, **sWdiaghip** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagulcer indicates the age at which the respondent was first diagnosed with a stomach or duodenal ulcer, or peptic ulcer. Respondents who have never been diagnosed with a stomach ulcer are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with a stomach ulcer is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiagulcer** are assigned special missing codes (.d), (.r), and (.m), respectively.

sWdiagulcer indicates the age at which the respondent's current wave's spouse was first diagnosed with a stomach, duodenal, or peptic ulcer, and is taken from **radiagulcer**. In addition to the special missing codes employed by **radiagulcer**, **sWdiagulcer** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagasthma indicates the age at which the respondent was first diagnosed with asthma. Respondents who have never been diagnosed with asthma are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with asthma is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiagasthma** are assigned special missing codes (.d), (.r), and (.m), respectively. **radiagasthma** is set to special missing (.q) in Wave 4 for respondents in countries where this question is not asked (only asked in Austria, Netherlands, and Belgium). **radiagasthma** is also assigned special missing (.q) starting in Wave 5 when this question is no longer asked.

sWdiagasthma indicates the age at which the respondent's current wave's spouse was first diagnosed with asthma, and is taken from **radiagasthma**. In addition to the special missing codes employed by **radiagasthma**, **sWdiagasthma** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagosteo indicates the age at which the respondent was first diagnosed with osteoporosis. Respondents who have never been diagnosed with osteoporosis are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with osteoporosis is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiagosteo** are assigned special missing codes (.d), (.r), and (.m), respectively. **radiagosteo** is set to special missing (.q) in Wave 4 for respondents in countries where this question is not asked (only asked in Austria, Netherlands, and Belgium). **radiagosteo** is also assigned special missing (.q) starting in Wave 5 when this question is no longer asked.

sWdiagosteo indicates the age at which the respondent's current wave's spouse was first diagnosed with osteoporosis, and is taken from **radiagosteo**. In addition to the special missing codes employed by **radiagosteo**, **sWdiagosteo** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagpsych indicates the age at which the respondent was first diagnosed with emotional, nervous, or psychiatric problems. Respondents who have never been diagnosed with emotional, nervous, or psychiatric problems are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with emotional, nervous, or psychiatric

problems is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiagpsych** are assigned special missing codes (.d), (.r), and (.m), respectively. **radiagpsych** is set to special missing (.q) in Waves 1, 2, and 4, when this question is not asked.

sWdiagpsych indicates the age at which the respondent's current wave's spouse was first diagnosed with emotional, nervous, or psychiatric problems, and is taken from **radiagpsych**. In addition to the special missing codes employed by **radiagpsych**, **sWdiagpsych** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagkidney indicates the age at which the respondent was first diagnosed with chronic kidney disease. Respondents who have never been diagnosed with chronic kidney disease are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with chronic kidney disease is provided in multiple waves, the first provided age is used. Don't know, refused, or other missing responses of **radiagkidney** are assigned special missing codes (.d), (.r), and (.m), respectively. **radiagkidney** is set to special missing (.q) in Waves 1, 2, 4, and 5 when this question is not asked.

sWdiagkidney indicates the age at which the respondent's current wave's spouse was first diagnosed with chronic kidney disease, and is taken from **radiagkidney**. In addition to the special missing codes employed by **radiagkidney**, **sWdiagkidney** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

If a respondent reports having a diagnosed condition, then they are asked when they were first diagnosed. For details on wave specific differences please refer to the "Cross Wave Differences in SHARE" portion of the above "Doctor Diagnosed Health Problems" section.

The age at which the respondent was first diagnosed with asthma or osteoporosis is asked in Waves 1 and 2, and for respondents in Austria, Netherlands, and Belgium in Wave 4, but are no longer asked at all starting in Wave 5. The age at which the respondent was first diagnosed with a psychological disorder is not asked in Waves 1, 2, and 4, and is asked starting in Wave 5. The age at which the respondent was first diagnosed with chronic kidney disease is not asked in Waves 1, 2, 4, and 5, and is asked starting in Wave 6.

Respondents who were given the life history questionnaire in Wave 7, and so were given the condensed core interview instead of the typical core interview, were asked whether they had been diagnosed with a condition, but were not asked the age at which they had been first diagnosed.

Cross-Study Differences with the HRS

Respondents are asked separate questions about the occurrence of a heart attack, diagnosis of congestive heart failure, diagnosis of abnormal heart rhythm, and diagnosis of angina in later waves of the HRS. Differently from HRS, these questions are never asked separately in SHARE, but rather in one question listing "A heart attack including myocardial infarction or coronary thrombosis or any other heart problem including congestive heart failure".

In the HRS, respondents are asked to report the year of diagnosis, from which age at diagnosis is calculated using birth year in the Harmonized HRS. In the SHARE, respondents are asked to report the age of diagnosis.

radiagdiab is included in the Harmonized HRS, all the rest, **radiaghbp**, **radiagcancr**, **radiaglung**, **radiagheart**, **radiagstrok**, **radiagarthr**, **radiaghchol**, **radiagparkin**, **radiagcatrct**, **radiaghip**, **radiagulcer**, **radiagasthma**, **radiagosteo**, **radiagpsych**, and **radiagkidney** are only available in Gateway Harmonized SHARE. In the HRS, questions about cancer, heart attack, and stroke pertain to the most recent current occurrence of the disease, rather than the first diagnosis of the disease and the Harmonized HRS reflects age at the most recent occurrence of the above conditions. Questions about when the respondent was diagnosed with high blood pressure, psychological problems,

and arthritis are not asked in the HRS. The question about being diagnosed with Parkinson's disease is not asked in the HRS. The question about being diagnosed with an ulcer only pertains to the whether the respondent is experiencing any at the current wave. The question about being diagnosed with chronic kidney disease is only asked in the HRS in 2016.

Continuous Variable Distributions

How Constructed

These variables indicate whether the respondent takes medication for a condition at least once a week. The respondent is presented with a list and asked to select conditions that they take medication for at least once a week, regardless of whether or not they have been diagnosed with the condition. These variables are coded as 0.no, and 1.yes. Don't know, refused, or other missing responses of these variables are assigned special missing codes (.d), (.r), and (.m), respectively. These variables are set to plain missing (.) for respondents who did not participate in the current wave. Please note that if the respondent disputes their diagnosis of heart attack after having reported taking medication for a heart problem, then the ever diagnosed variable is adjusted, but the medication use variable is left as reported.

rWrxihibp indicates whether the respondent takes medication for high blood pressure. **rWrxi diab** indicates whether the respondent takes medication for diabetes. **rWrxiheart** indicates whether the respondent takes medication for heart problems. **rWrxiheart** indicates whether the respondent takes medication for coronary or cerebrovascular diseases, or for other heart diseases. **rWrxi hchol** indicates whether the respondent takes medication for high cholesterol. **rWrxi asthma** indicates whether the respondent takes medication for asthma. **rWrxi lung** indicates whether the respondent takes medication for chronic bronchitis. **rWrxi psych** indicates whether the respondent takes medication for anxiety or depression. **rWrxi osteo** indicates whether the respondent takes medication for osteoporosis, hormonal or other than hormonal. **rWrxi ulcer** indicates whether the respondent takes medication for stomach burns. **rWslpmed** indicates whether the respondent takes medication for sleep problems. **rWrxi inflm** indicates whether the respondent takes medication for suppressing inflammation (only glucocorticoids or steroids), and is available starting in Wave 5.

sWrxihibp, **sWrxi diab**, **sWrxiheart**, **sWrxi hchol**, **sWrxi asthma**, **sWrxi lung**, **sWrxi psych**, **sWrxi osteo**, **sWrxi ulcer**, **sWslpmed**, and **sWrxi inflm** indicate whether the respondent's current wave's spouse takes medication or receives

treatment for the specified condition, and are taken from corresponding respondent variables. In addition to the special missing codes employed by the respondent variables, the spouse variables employ two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Respondents are only asked about asthma in Waves 1, 2, and 4 and hence **rWrxasthma** is only available in those waves.

Respondents start being asked about taking medication for suppressing inflammation in Wave 5, as such, that is when **rWrxinflm** becomes available.

Starting in Wave 5, whether the respondent is taking drugs for osteoporosis is asked in a single question, whereas in previous waves, it was asked about as drugs for osteoporosis, hormonal, or drugs for osteoporosis, other than hormonal.

Cross-Study Differences with the HRS

For most diseases in the HRS, the respondent is first asked whether they have a condition, and are asked if they take medication for that condition only if they report being diagnosed. In the HRS, these diseases include: high blood pressure, diabetes, stroke, angina, congestive heart failure, arthritis, lung conditions, psychiatric conditions, cancer, heart attack, and memory problems. In SHARE however, the respondent is presented with a list and asked to select each of the conditions that the respondent takes medication for.

Unlike in the HRS, SHARE respondents are not asked about insulin and diabetes medications separately. Instead they answer one question of whether they receive a treatment or medications for the condition. Their response is recorded in the **rWrxdiab** variable of Gateway Harmonized SHARE.

Unlike in the HRS, SHARE respondents are asked about receiving drugs for coronary or cerebrovascular diseases and other heart diseases separately, both represented in **rWrxheart**. In HRS, they answer questions about taking medications for heart problems, which is coded in **rWrxheart**. However, they are also asked about taking medications for angina, congestive heart failure, and heart attack if they report having those conditions.

Alzheimer's Disease or Dementia

Variable	Waves	Label	Type
rWalzdeme	2, 4-9	rWalzdeme:ww R ever had alzheimer's/dementia	Categ
sWalzdeme	2, 4-9	sWalzdeme:ww S ever had alzheimer's/dementia	Categ
radiagalzdem	All	radiagalzdem: R age first diagnosed with alzheimer's/dementia	Cont
sWdiagalzdem	2, 4-9	sWdiagalzdem:ww S age first diagnosed with alzheimer's/dementia	Cont

How Constructed

rWalzdeme indicates whether or not the respondent ever reports that a doctor told the respondent they have Alzheimer's/dementia. Specifically, SHARE asks whether a doctor has told the respondent they had or currently have Alzheimer's disease, dementia, organic brain syndrome, senility or any other serious memory impairment. A code of 0 indicates that the respondent does not report having been told by a doctor they have the condition. A code of 1 indicates that the respondent reports having been told by a doctor they have the condition. For respondents who joined the SHARE survey after Wave 1, in the respondent's first survey, respondents are asked whether they have ever had Alzheimer's/dementia and then in all follow up surveys they are asked whether they currently have Alzheimer's/dementia. Respondents who were interviewed as part of SHARE Wave 1 were never asked whether they have ever been diagnosed with Alzheimer's/dementia and instead were always asked whether they currently have Alzheimer's/dementia. Previous reports (both a first ever report and all following current reports) are fed-forward to derive **rWalzdeme**. When respondents don't know, refuse to answer, or having missing responses, **rWalzdeme** is assigned special missing values (.d), (.r), and (.m), respectively. **rWalzdeme** is set to plain missing (.) for respondents who did not respond to the current wave.

sWalzdeme indicates whether the respondent's spouse reported ever being told by a doctor they have Alzheimer's/dementia and is taken directly from the spouse's **rWalzdeme**. In addition to the special missing codes used in **rWalzdeme**, **sWalzdeme** employs two other missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

radiagalzdem indicates the age at which the respondent was first diagnosed with Alzheimer's/dementia. Respondents who have never been diagnosed with Alzheimer's/dementia are not asked this question and are assigned a special missing code (.x). If the age first diagnosed with Alzheimer's/dementia is provided in multiple waves, the first provided age is used. If the respondent reports a new diagnosis after their first interview, they are not asked the age at which they were diagnosed, and **radiagalzdem** is assigned special missing (.s). Don't know, refused, or other missing responses of **radiagalzdem** are assigned special missing codes (.d), (.r), and (.m), respectively. **radiagalzdem** is assigned special missing (.q) in Wave 1 when this question is not asked. **radiagalzdem** is assigned special missing (.c) in Wave 7 if the respondent has been diagnosed with Alzheimer's/dementia but is not asked the age at which they were diagnosed because they were given the condensed core interview and the life history interview in this wave. **radiagalzdem** is assigned special missing (.i) if the respondent reports an age diagnosed that is greater than their age in the current interview year. Please note that extreme values may be present in this variable and have been left to the discretion of the user.

sWdiagalzdem indicates the age at which the respondent's current wave's spouse was first diagnosed with Alzheimer's/dementia, and is taken from **radiagalzdem**. In addition to the special missing codes employed by **radiagalzdem**, **sWdiagalzdem** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Wave 1 of SHARE did not include a question about Alzheimer's/dementia but it was added starting in Wave 2.

Respondents who were interviewed as part of SHARE Wave 1 were never asked whether they have ever been diagnosed with Alzheimer's/dementia and instead were always asked whether they currently have Alzheimer's/dementia. For respondents

who joined the SHARE survey after Wave 1, in the respondent's first survey, respondents are asked whether they have ever had Alzheimer's/dementia and then in all follow up surveys they are asked whether they currently have Alzheimer's/dementia. Previous reports (both a first ever report and all following current reports) are fed-forward to derive **rWalzdeme**.

Respondents who were given the life history questionnaire in Wave 7, and so were given the condensed core interview instead of the typical core interview, were asked whether they had been diagnosed with a condition, but were not asked the age at which they had been first diagnosed.

Cross-Study Differences with the HRS

In Waves 4 through 9 of the HRS, the respondent is asked if they have been diagnosed with memory problems, and starting in Wave 10, they are asked if they have been diagnosed with Alzheimer's or dementia separately. As such, **rWmemrye** is available in Waves 4 through 9 of the RAND HRS, and **rWalzhe** and **rWdemene** are available starting in Wave 10. In the SHARE, a single question is asked about Alzheimer's and dementia starting in Wave 2, so **rWalzdeme** is available starting in Wave 2 of the Gateway Harmonized SHARE.

rWbmicat	1-2, 4-9	rWbmicat:ww R BMI categorization	Categ
sWbmicat	1-2, 4-9	sWbmicat:ww S BMI categorization	Categ
rWobese	1-2, 4-9	rWobese:ww R whether obese	Categ
sWobese	1-2, 4-9	sWobese:ww S whether obese	Categ

How Constructed

rWheight and **rWweight** are the respondent's self-reported height and weight, respectively. **rWbmi** is the respondent's BMI calculated from their self-reported height and weight. **rWbmicat** is a variable indicating which WHO category the individual's BMI falls in. **rWobese** is a variable indicating whether the respondent is obese according to their BMI, meaning a BMI of 30 or greater. In Waves 2, 4, 7, and 8, only baseline respondents are asked to report height. **rWheight** in these waves uses the most recent report of height to assign a value for **rWheight**.

Height is given in meters, weight in kilograms, and BMI is weight divided by the square of height. **rWbmicat** is categorized as follows: 1.Underweight (less than 18.5), 2.Normal weight (18.5-24.9), 3.Pre-obesity (25-29.9), 4.Obesity class I (30-34.9), 5.Obesity class II (35-39.9), 6.Obesity class III (greater than or equal to 40). **rWobese** is assigned a 0 if the respondent is not obese (BMI less than 30), and is assigned a 1 if the respondent is obese (BMI of 30 or more).

Special missing code (.i) is used for **rWheight** when the respondent reports a height less than 90cm. Special missing code .i is used for **rWweight** when the respondent reports a height less than 13kg. **rWbmi**, **rWbmicat**, and **rWobese** are set to special missing code (.i) if the height or weight value has been coded as (.i). When respondents don't know, refuse to answer, or are missing, these variables are set to (.d), (.r), (.m), respectively. These variables are set to plain missing (.) when the respondent did not participate in the current wave.

sWheight, **sWweight**, **sWbmi**, **sWbmicat**, and **sWobese** are the measures of the respondent's spouse and are taken directly from the spouse's **rWheight**, **rWweight**, **rWbmi**, **rWbmicat**, and **rWobese**, respectively. In addition to the special missing codes used by **rWheight**, **rWweight**, **rWbmi**, **rWbmicat**, and **rWobese**, **sWheight**, **sWweight**, **sWbmi**, **sWbmicat**, and **sWobese** employ two additional special missing values, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 1, SHARE allowed respondents to report height values in the range of 100-230cm. Starting in Wave 2, respondents could report height values ranging from 0-230cm.

In Waves 2, 4, 7, 8, and 9, only baseline respondents were asked to report their height. **rWheight** in these waves uses the most recent report of height to assign a value for **rWheight**. In Waves 5 and 6, SHARE asked all respondents to report height values.

Cross-Study Differences with the HRS

No differences known.

How Constructed

rWglasses indicates whether the respondent usually wears glasses or contact lenses. **rWglasses** is coded as 0.no, and 1.yes. Don't know, refused, or other missing responses of **rWglasses** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWglasses** is set to plain missing (.) for respondents who did not participate in the current wave.

sWglasses indicates whether the respondent's current wave's spouse usually wears glasses or contact lenses, and is taken from **rWglasses**. In addition to the special missing codes employed by **rWglasses**, **sWglasses** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWsight indicates the respondent's self-rated eyesight while wearing glasses or corrective lenses as usual. Respondents are also asked to rate their distance vision, and near vision while wearing glasses or corrective lenses as usual, these responses are coded in **rWdsight** and **rWnsight**, respectively. These variables are coded as follows: 1.excellent, 2.very good, 3.good, 4.fair, 5.poor. If the respondent spontaneously reports blindness when rating their sight in Waves 1 and 2, then **rWsight**, **rWdsight** and **rWnsight** are coded with a value of 6.blind. The question about self-rated eyesight is only asked in Wave 1, while self-rated distance and near vision are asked in all waves. Participants in the SHARELIFE Wave 7 questionnaire are not asked these questions so **rWdsight** and **rWnsight** are assigned special missing value (.c). Don't know, refused, or other missing responses of **rWsight**, **rWdsight**, and **rWnsight** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWsight**, **rWdsight**, and **rWnsight** are set to plain missing (.) for respondents who did not participate in the current wave.

sWsight, **sWdsight**, and **sWnsight** indicate the self-rated eyesight, distance vision, and near vision of the respondent's current wave's spouse, and are taken from **rWsight**, **rWdsight**, and **rWnsight**. In addition to the special missing codes employed by **rWsight**, **rWdsight**, and **rWnsight**, **sWsight**, **sWdsight**, and **sWnsight** employ two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWcatrct1y indicates whether the respondent reported having cataract surgery in the last year and is available only in Wave 1. Respondents can report having cataract surgery in an inpatient setting by reporting an overnight hospital stay, having inpatient surgery, and selecting cataract surgery from the list of possible procedures. Respondents can report having cataract surgery in an outpatient setting by reporting an outpatient surgery, and selecting cataract surgery from the list of possible procedures. **rWcatrct1y** is coded as 0.no, and 1.yes. Don't know, refused, or other missing responses of **rWcatrct1y** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWcatrct1y** is set to plain missing (.) for respondents who did not participate in the current wave.

sWcatrct1y indicates whether the respondent's current wave's spouse reported having cataract surgery in the last year, and is taken from **rWcatrct1y**. In addition to the special missing codes employed by **rWcatrct1y**, **sWcatrct1y** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The questions about self-rated eyesight while wearing glasses or corrective lenses as usual and having cataract surgery in the last year are only asked in Wave 1.

Spontaneous answers of blindness are only allowed in Waves 1 and 2.

Participants in the SHARELIFE Wave 7 questionnaire are not asked to rate their far or near sight.

Cross-Study Differences with the HRS

Whether the respondent has had cataract surgery is asked about the past year in Wave 1 of SHARE, where the question is asked about the past two years in the HRS.

Hearing

Variable	Waves	Label	Type
rWhearing	1-2, 4-9	rWhearing:ww R self-rated hearing	Categ
sWhearing	1-2, 4-9	sWhearing:ww S self-rated hearing	Categ
rWhearaid	1-2, 4-9	rWhearaid:ww R wears hearing aid	Categ
sWhearaid	1-2, 4-9	sWhearaid:ww S wears hearing aid	Categ

How Constructed

rWhearing indicates the respondent's self-rated hearing. Respondents who have a hearing aid are asked to rate their hearing when using their hearing aid as usual. **rWhearing** is coded as follows: 1.excellent, 2.very good, 3.good, 4.fair, 5.poor. **rWhearing** is taken from a single question asking the respondent to rate their hearing while wearing a hearing aid or as usual. Participants in the SHARELIFE Wave 7 questionnaire are not asked this question and so are assigned special missing value (.c). Don't know, refused, or other missing responses of **rWhearing** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWhearing** is set to plain missing (.) for respondents who did not participate in the current wave.

sWhearing indicates the self-rated hearing of the respondent's current wave's spouse, and is taken from **rWhearing**. In addition to the special missing codes employed by **rWhearing**, **sWhearing** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWhearaid indicates whether the respondent usually wears a hearing aid. **rWhearaid** is coded as follows: 0.no, 1.yes. Starting with the regular Wave 7 questionnaire, respondents are asked whether they have a hearing aid and if so, then they were asked if they usually wear a hearing aid. Participants in the SHARELIFE Wave 7 questionnaire are not asked these questions and so are assigned special missing value (.c). Don't know, refused, or other missing responses of **rWhearaid** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWhearaid** is set to plain missing (.) for respondents who did not participate in the current wave.

sWhearaid indicates whether the respondent's current wave's spouse ever wears a hearing aid, and is taken from **rWhearaid**. In addition to the special missing codes employed by **rWhearaid**, **sWhearaid** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Participants in the SHARELIFE Wave 7 questionnaire are not asked to rate their hearing and whether they have or wear a hearing aid.

Starting in Wave 7, participants were asked whether they have a hearing aid and if so, they were then asked if they usually wear a hearing aid. Whereas in previous waves, they were only asked if they usually wear a hearing aid.

Cross-Study Differences with the HRS

No differences known.

Dental Health

Variable	Waves	Label	Type
rWdenture	1-2	rWdenture:wW R wears dentures	Categ
sWdenture	1-2	sWdenture:wW S wears dentures	Categ
rWdenture_s	5	rWdenture_s:wW R wears dentures, implant, bridge	Categ
sWdenture_s	5	sWdenture_s:wW S wears dentures, implant, bridge	Categ
rWnoteeth	5	rWnoteeth:wW R has no natural teeth remaining	Categ
sWnoteeth	5	sWnoteeth:wW S has no natural teeth remaining	Categ

How Constructed

rWdenture indicates whether the respondent uses dentures. In Waves 1 and 2, respondents are asked if they use dentures. No responses are coded as 0 and yes responses are coded as 1. **rWdenture_s** indicates whether the respondent uses dentures, implants, or bridges. In Wave 5, respondents who do not have all of their natural teeth are asked to what extent their missing teeth are replaced with artificial teeth (bridge, denture, or implant). If they have all of their natural teeth or do not replace any missing teeth with artificial teeth, then they are coded as 0 for no, and if they fully or partially replace their missing teeth with artificial teeth, then they are coded as 1 for yes. Don't know, refused, or other missing responses of **rWdenture** and **rWdenture_s** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWdenture** and **rWdenture_s** are set to plain missing (.) for respondents who did not participate in the current wave.

sWdenture and **wWdenture_s** indicate whether the respondent's current wave's spouse uses dentures or implants, and are taken from **rWdenture** and **rWdenture_s**. In addition to the special missing codes employed by **rWdenture** and **rWdenture_s**, **sWdenture** and **sWdenture_s** employ two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWnoteeth indicates whether the respondent has no natural teeth remaining. In Wave 5, respondents are asked if they have all of their natural teeth, and if not, how many natural teeth are missing. **rWnoteeth** is coded as 0 if they have all of their teeth or are missing 0-27 teeth. **rWnoteeth** is coded as 1 if they are missing 28 or more teeth. Don't know, refused, or other missing responses of **rWnoteeth** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWnoteeth** is set to plain missing (.) for respondents who did not participate in the current wave.

sWnoteeth indicates whether the respondent's current wave's spouse has no natural teeth remaining, and is taken from **rWnoteeth**. In addition to the special missing codes employed by **rWnoteeth**, **sWnoteeth** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Respondents are asked directly about using dentures only in Waves 1 and 2. Respondents are asked whether they have all of their teeth, the number of missing teeth, and to what extent their missing teeth are replaced with artificial teeth (bridge, denture, or implant) only in Wave 5.

Cross-Study Differences with the HRS

In HRS, respondents are asked whether they have lost all of their permanent teeth as a yes/no question. In SHARE, respondents are asked no questions on dental health, whether they use dentures, or whether they have all of their teeth, the number of missing teeth, and to what extent their missing teeth are replaced with artificial teeth depending on the wave.

Falls

Variable	Waves	Label	Type
rWfall_s	1-2, 4-9	rWfall_s:WW R bothered by a fall last 6 mo.	Categ
sWfall_s	1-2, 4-9	sWfall_s:WW S bothered by a fall last 6 mo.	Categ

How Constructed

rWfall_s indicates whether in the last six months (at least), the respondent has been bothered by falling down. **rWfall_s** is coded as 0.no and 1.yes. Don't know, refused, or other missing responses of **rWfall_s** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWfall_s** is set to plain missing (.) for respondents who did not participate in the current wave.

sWfall_s indicates whether the respondent's current wave's spouse has been bothered by falling down in the past six months, and is taken from **rWfall_s**. In addition to the special missing codes employed by **rWfall_s**, **sWfall_s** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

HRS asks whether the respondent has fallen in the past two years (**rWfall** in the Harmonized HRS), whereas SHARE asks if the respondent has been bothered by falling down in the past six months at least.

Urinary Incontinence

Variable	Waves	Label	Type
rWurina16m	1-2, 4	rWurina16m:WW R any urinary incontinence last 6 mo.	Categ
sWurina16m	1-2, 4	sWurina16m:WW S any urinary incontinence last 6 mo.	Categ
rWurinpad	6-9	rWurinpad:WW R uses pads for incontinence	Categ
sWurinpad	6-9	sWurinpad:WW S uses pads for incontinence	Categ

How Constructed

rWurina16m indicates whether the respondent has been bothered by any urinary incontinence in the past six months at least. **rWurina16m** is coded as 0.no, and 1.yes. Don't know, refused, or other missing responses of **rWurina16m** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWurina16m** is set to plain missing (.) for respondents who did not participate in the current wave. This question was asked in Waves 1, 2 and 4.

sWurina16m indicates whether the respondent's current wave's spouse has been bothered by any incontinence and is taken from **rWurina16m**. In addition to the special missing codes employed by **rWurina16m**, **sWurina16m** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWurinpad indicates whether the respondent ever uses incontinence pads. The respondent is presented with a list of personal aid items and is asked to select any aids that are used, one of which is incontinence pads. **rWurinpad** is coded as 0.no, and 1.yes. Respondents who report no difficulty or don't know or refuse to report any difficulty with any of the activities listed under "Other Functional Limitations", "Activities of Daily Living (ADLs)", or "Instrumental Activities of Daily Living (IADLs)" are not asked this question, and are assigned special missing (.s). Participants in the SHARELIFE Wave 7 questionnaire are not asked this question and so are assigned special missing value (.c). Don't know, refused, or other missing responses of **rWurinpad** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWurinpad** is set to plain missing (.) for respondents who did not participate in the current wave. This question was asked starting in Wave 6.

sWurinpad indicates whether the respondent's current wave's spouse ever uses incontinence pads, and is taken from **rWurinpad**. In addition to the special missing codes employed by **rWurinpad**, **sWurinpad** employs two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The question about being bothered by any urinary incontinence in the past six months at least, was asked in Waves 1, 2, and 4.

The question about usage of incontinence pads is asked starting in Wave 6. Participants in the SHARELIFE Wave 7 questionnaire are not asked this question.

Cross-Study Differences with the HRS

In SHARE the question about urinary incontinence is asked about being bothered by incontinence for the past six months at least, whereas in HRS the urinary incontinence question is asked with regards to the experience of incontinence in the past 12 months.

How Constructed

rWpain_s indicates whether the respondent is bothered by pain in their back, knees, hips or any other joint. Respondents are presented with a list of symptoms and asked to select any symptoms that have bothered the respondent for the past six months at least. **rWpain_s** is coded as 0.no, and 1.yes. **rWpain_s** is available in Waves 1, 2 and 4. Don't know, refused, or other missing responses of **rWpain_s** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWpain_s** is set to plain missing (.) for respondents who did not participate in the current wave.

sWpain_s indicates whether the respondent's current wave's spouse is bothered by pain in their back, knees, hips or any other joint, and its values are taken from **rWpain_s**. In addition to the special missing codes employed by **rWpain_s**, **sWpain_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWpainfr indicates whether the respondent is troubled with pain. **rWpainfr** is coded as 0.no, and 1.yes. Participants in the SHARELIFE Wave 7 questionnaire are not asked this question and so are assigned special missing value (.c). Don't know, refused, or other missing responses of **rWpainfr** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWpainfr** is set to plain missing (.) for respondents who did not participate in the current wave. This question is asked starting in Wave 5.

rWpainlv indicates the respondent's usual level of pain. **rWpainlv** is coded as 0.no pain, 1.mild, 2.moderate, 3.severe. If the respondent is not troubled with pain, then **rWpainlv** is assigned a value of 0. Participants in the SHARELIFE Wave 7 questionnaire are not asked this question and so are assigned special missing value (.c). Don't know, refused, or other missing responses of **rWpainlv** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWpainlv** is set to plain missing (.) for respondents who did not participate in the current wave. This question is asked starting in Wave 5.

sWpainfr and **sWpainlv** indicate the respondent's current wave's spouse's experience with pain, and are taken from **rWpainfr** and **rWpainlv**. In addition to the special missing codes employed by **rWpainfr** and **rWpainlv**, **sWpainfr** and **sWpainlv** employ two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWpainmed indicates whether the respondent takes medication at least once a week for pain. The respondent is presented with a list of conditions and asked to select which ones they take medication for at least once a week, regardless of having been diagnosed with the condition. **rWpainmed** is coded as 0 if the respondent does not take medication for joint pain or joint inflammation, or for other pain (e.g. headache, backpain, etc) at least once a week, and is coded as 1 if the respondent does take medication for joint pain or joint inflammation, or for other pain at least once a week. Don't know, refused, or other missing responses of **rWpainmed** are assigned special missing codes (.d), (.r), and (.m), respectively. **rWpainmed** is set to plain missing (.) for respondents who did not participate in the current wave.

sWpainmed indicates whether the respondent's current wave's spouse takes medication for pain at least weekly, and its values are taken from **rWpainmed**. In addition to the special missing codes employed by **rWpainmed**, **sWpainmed** employs

two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The question about whether the respondent is bothered with pain in their joints is available in Waves 1, 2, and 4.

Questions about whether the respondent is troubled with pain and the level of pain usually felt are available starting in Wave 5.

Participants in the SHARELIFE Wave 7 questionnaire are not asked if they are troubled with pain and the level of pain usually felt.

Cross-Study Differences with the HRS

The questions about how the respondent's pain interferes with normal work and everyday activities are not asked in SHARE, whereas those are asked in the HRS.

In the Harmonized HRS, **rWrxpain** indicates whether the respondent takes medication for pain in their joints or muscles, whereas in the Gateway Harmonized SHARE, **rWpainmed** indicates whether the respondent takes medication for joint pain or joint inflammation, or other pain.

Health Behaviors

Variable	Waves	Label	Type
rWvgactx	1-2, 4-9	rWvgactx:WW R Freq vigorous phys activ	Categ
sWvgactx	1-2, 4-9	sWvgactx:WW S Freq vigorous phys activ	Categ
rWmdactx	1-2, 4-9	rWmdactx:WW R Freq moderate phys activ	Categ
sWmdactx	1-2, 4-9	sWmdactx:WW S Freq moderate phys activ	Categ

How Constructed

rWvgactx and **rWmdactx** indicate the frequency of vigorous and moderate levels of energy physical activity, respectively. A code of 2 indicates that the respondent engages in the type of physical activity more than once a week. A code of 3 indicates that the respondent engages in the type of activity once a week. A code of 4 indicates that the respondent engages in the type of activity one to three times a month. A code of 5 indicates that the respondent engages in the type of activity hardly ever or never.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview) were asked questions about physical activity. Those that weren't asked are assigned special missing value (.c) in Wave 7. When respondents don't know, refuse to answer, or are missing, **rWvgactx** and **rWmdactx** are assigned special missing values (.d), (.r), or (.m), respectively. **rWvgactx** and **rWmdactx** are set to plain missing (.) for respondents who did not respond to the current wave.

sWvgactx and **sWmdactx** record the frequency with which the respondent's spouse engages in the type of activity and are taken directly from the spouse's **rWvgactx** and **rWmdactx**, respectively. In addition to the special missing codes used by **rWvgactx** and **rWmdactx**, **sWvgactx** and **sWmdactx** employ two additional special missing codes, (.u) and (.v). These variables employ the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), meaning those who were given the regular and not condensed questionnaire in Wave 7, were asked questions about physical activity.

Cross-Study Differences with the HRS

In the HRS, questions about physical activity change across waves in terms of both format and wording. From Wave 3 (1996) to Wave 6 (2002), the HRS only asks about vigorous exercise, but does not collect information about moderate or light physical activities. Starting from Wave 7 (2004), the HRS questionnaire features a series of three questions, one concerning vigorous, one concerning moderate, and one concerning mild/light physical activity. The former two are analogous to those asked in the SHARE and available in the RAND HRS under the names **rWvgactx** and **rWmdactx**, respectively (the same used above), but they include a code of 1 for exercising every day.

How Constructed

rWdrinkev indicates whether the respondent has ever had an alcoholic drink ever. A code of 0 indicates that the respondent has not ever had an alcoholic drink. A code of 1 indicates that the respondent has had an alcoholic drink. This question was added to SHARE in Wave 2 where it was asked to all respondents. In Waves 4 and 5 it was only asked as part of baseline interviews. If the respondent was not asked because it was a follow-up interview, **rWdrinkev** is set to special missing (.q). When respondents don't know, refuse to answer, or have missing responses, **rWdrinkev** is assigned special missing values (.d), (.r), (.m), respectively. **rWdrinkev** is set to plain missing (.) for respondents who did not respond to the current wave.

sWdrinkev records whether the respondent's spouse ever drinks and is taken directly from the spouse's **rWdrinkev**. In addition to the special missing codes used in **rWdrinkev**, **sWdrinkev** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWdrink3m indicates whether the respondent has had an alcoholic drink during a certain period. Such reference period corresponds to the last 6 months in Wave 1 and to the last 3 months in Wave 2 and all following waves. A code of 0 indicates that the respondent did not have an alcoholic drink. A code of 1 indicates that the respondent had an alcoholic drink. When respondents don't know, refuse to answer, or have missing responses, **rWdrink3m** is assigned special missing values (.d), (.r), (.m), respectively. **rWdrink3m** is set to plain missing (.) for respondents who did not respond to the current wave.

sWdrink3m records the respondent's spouse's drinking behavior and is taken directly from the spouse's **rWdrink3m**. In addition to the special missing codes used in **rWdrink3m**, **sWdrink3m** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWdrinkx records the respondent's frequency of drinking during a certain period. In SHARE, respondents are able to report drinking "almost every day", "five or six days a week", "three or four days a week", "once or twice a week", "once or twice a

month", "less than once a month", or "not at all". In order to provide a harmonized measure of drinking frequency, **rWdrinkx** uses a more general set of categories. A code of 0 indicates the respondent drinks not at all or less than once a month. A code of 1 indicates the respondent drinks once or twice a month. A code of 2 indicates the respondent drinks one or twice a week or three or four days a week. A code of 3 indicates the respondent drinks five or six days a week. A code of 4 indicates the respondent drinks almost every day. When respondents don't know, refuse to answer, or have missing responses, **rWdrinkx** is assigned special missing values (.d), (.r), (.m), respectively. **rWdrinkx** is set to plain missing (.) for respondents who did not respond to the current wave.

sWdrinkx records the respondent's spouse's frequency of drinking and is taken directly from the spouse's **rWdrinkx**. In addition to the special missing codes used in **rWdrinkx**, **sWdrinkx** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWdrinkxw indicates whether the respondent drinks weekly or has had an alcoholic drink during the last 7 days, depending on the wave. A code of 0 indicates that the respondent does not drink weekly or has not had a drink in the last 7 days. A code of 1 indicates that the respondent does drink weekly or has had an alcoholic drink in the last 7 days. In Waves 1 through 5, respondents are asked about the frequency of drinking alcohol in the last 3 months, and all respondents that report drinking at least weekly are assigned a value of 1 for this variable. Starting in Wave 6, respondents are asked directly whether they have had an alcoholic drink in the last 7 days. In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked this question. Those that weren't asked are assigned special missing value (.c) in Wave 7. When respondents don't know, refuse to answer, or have missing responses, **rWdrinkxw** is assigned special missing values (.d), (.r), (.m), respectively. **rWdrinkxw** is set to plain missing (.) for respondents who did not respond to the current wave.

sWdrinkxw records the respondent's spouse's weekly drinking behavior and is taken directly from the spouse's **rWdrinkxw**. In addition to the special missing codes used in **rWdrinkxw**, **sWdrinkxw** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWdrinkn records the respondent's number of drinks per day when they drink in the last 3 months. **rWdrinkn** is set to 0 for respondents who reported not drinking in the last 3 months. When respondents don't know, refuse to answer, or have missing responses, **rWdrinkn** is assigned special missing values (.d), (.r), (.m), respectively. **rWdrinkn** is set to plain missing (.) for respondents who did not respond to the current wave.

sWdrinkn records the respondent's spouse's number of drinks per day and is taken directly from the spouse's **rWdrinkn**. In addition to the special missing codes used in **rWdrinkn**, **sWdrinkn** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWdrinkn7 records the respondent's number of drinks in the last 7 days, and is asked starting in Wave 6. **rWdrinkn7** is set to 0 for respondents who reported not drinking in the last 7 days. In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked this question. Those that weren't asked are assigned special missing value (.c) in Wave 7. When respondents don't know, refuse to answer, or have missing responses, **rWdrinkn7** is assigned special missing values (.d), (.r), (.m), respectively. **rWdrinkn7** is set to plain missing (.) for respondents who did not respond to the current wave.

sWdrinkn7 records the respondent's spouse's number of drinks in the last 7 days and is taken directly from the spouse's **rWdrinkn7**. In addition to the special missing codes used in **rWdrinkn7**, **sWdrinkn7** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWdrinkb indicates whether the respondent ever binge drinks, and is asked starting in Wave 2. Binge drinking is determined by the question: "In the last three months, on how many days have you had four or more drinks on one occasion?" If the respondent reports a value of 0 to this question or reports drinking 0 days per week in the last 3 months, then **rWdrinkb** is coded as 0.no. If the respondent reports a number of 1 or greater to this question, then **rWdrinkb** is coded as 1.yes. Starting in Wave 4, the respondent is asked the question: "In the last three months, on how many days have you had six or more drinks on one occasion?" Respondents are able to report drinking that amount "every day or almost every day", "five

or six days a week", "three or four days a week", "once or twice a week", "once or twice a month", "less than once a month", or "not at all in the last 3 months". If the respondent reports not drinking six or more drinks on one occasion in the last 3 months or reports drinking 0 days per week in the last 3 months, then **rWdrinkb** is coded as 0.no. If the respondent reports drinking six or more drinks on one occasion less than once a month or more often, then **rWdrinkb** is coded as 1.yes. In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked this question. Those that weren't asked are assigned special missing value (.c) in Wave 7. Don't know, refused, or other missing responses are assigned special missing codes (.d), (.r), (.m), respectively. **rWdrinkb** is set to plain missing (.) for respondents who did not participate in the current wave.

sWdrinkb indicates whether the respondent's spouse ever binge drinks and is taken directly from the spouse's **rWdrinkb**. In addition to the special missing codes used in **rWdrinkb**, **sWdrinkb** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWbinged records the number of days the respondent reports binge drinking in the last 3 months, and is only asked in Wave 2. Binge drinking is determined by the question: "In the last three months, on how many days have you had four or more drinks on one occasion?" If the respondent reports a value of 0 to this question or reports drinking 0 days per week in the last 3 months, then **rWdrinkb** is coded as 0. If the respondent reports a number of 1 or greater to this question, then **rWdrinkb** takes the numerical value. Don't know, refused, or other missing responses are assigned special missing codes (.d), (.r), (.m), respectively. **rWbinged** is set to plain missing (.) for respondents who did not participate in the current wave.

sWbinged records the respondent's spouse's frequency of binge drinking in the last 3 months and is taken directly from the spouse's **rWbinged**. In addition to the special missing codes used in **rWbinged**, **sWbinged** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWbingedcat indicates the respondent's frequency of binge drinking in the last 3 months, and is asked starting in Wave 4. Binge drinking is determined by the question: "In the last three months, how often did you have six or more drinks on one occasion?" Respondents are able to report drinking that amount "every day or almost every day", "five or six days a week", "three or four days a week", "once or twice a week", "once or twice a month", "less than once a month", or "not at all in the last 3 months". A code of 0 indicates the respondent drinks six or more drinks on one occasion not at all or less than once a month. A code of 1 indicates the respondent drinks six or more drinks on one occasion once or twice a month. A code of 2 indicates the respondent drinks six or more drinks on one occasion once or twice a week or three or four days a week. A code of 3 indicates the respondent drinks six or more drinks on one occasion five or six days a week. A code of 4 indicates the respondent drinks six or more drinks on one occasion every day or almost every day. In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked this question. Those that weren't asked are assigned special missing value (.c) in Wave 7. Don't know, refused, or other missing responses are assigned special missing codes (.d), (.r), (.m), respectively. **rWbingedcat** is set to plain missing (.) for respondents who did not participate in the current wave.

sWbingedcat records the respondent's spouse's frequency of binge drinking in the last 3 months and is taken directly from the spouse's **rWbingedcat**. In addition to the special missing codes used in **rWbingedcat**, **sWbingedcat** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

A question asking whether the respondent has ever had a drink was only asked in Waves 2, 4, and 5. In Wave 2 it was asked to all respondents and in Waves 4 and 5 it was only asked as part of baseline interviews, therefore there is only one report to the question for each respondent across all waves.

Questions about drinking frequency have also changed significantly between waves. In Wave 1, the respondent reports whether they have had any alcoholic drink in the last 6 months with the question "I am now going to ask you a few questions about what you drink - that is if you drink. Please look at card 11. During the last six months, how often have you drunk any alcoholic beverages, like beer, cider, wine, spirits or cocktails?" Showcard 11 contains the following list: 1.Almost every day,

2. Five or six days a week, 3. Three or four days a week, 4. Once or twice a week, 5. Once or twice a month, 6. Less than once a month, 7. Not at all in the last 6 months. Starting in Wave 2 and up to Wave 5, the respondent reports whether they have had any alcoholic drink in the last 3 months with the question "I am now going to ask you a few questions about what you drink - that is if you drink. Please look at card [card #] During the last 3 months, how often have you drunk any alcoholic beverages, like beer, cider, wine, spirits or cocktails?" The referenced showcard contains the following list: 1. Almost every day, 2. Five or six days a week, 3. Three or four days a week, 4. Once or twice a week, 5. Once or twice a month, 6. Less than once a month, 7. Not at all in the last 3 months. Starting in Wave 6, respondents are asked "During the last 7 days, have you had at least one alcoholic beverage?"

Number of drinks per day is asked beginning in Wave 2. It is not asked in Wave 1. Starting in Wave 6, the number of drinks per day the respondent drinks in the last 3 months is not asked. Instead, beginning in Wave 6, SHARE asks the number of drinks the respondent drank in the last 7 days.

The question about frequency of binge drinking is asked beginning in Wave 2. It is not asked in Wave 1. In Wave 2, the respondent reports the number of days they had four or more drinks on one occasion in the last 3 months. Starting in Wave 4, the respondent reports the number of days they had six or more drinks on one occasion the the last three months with the question "Please look at card [card #]. In the last three months how often did you have six or more drinks on one occasion?" The referenced showcard contains the following list: 1. Every day or almost every day, 2. Five or six days a week, 3. Three or four days a week, 4. Once or twice a week, 5. Once or twice a month, 6. Less than once a month, 7. Not at all in the last 3 months.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular and not condensed questionnaire in Wave 7, were asked these questions.

Cross-Study Differences with the HRS

In the HRS, a question about whether the respondent ever drinks is asked each wave. In SHARE this is only asked once for each respondent across Waves 2, 4, and 5.

In the HRS, the drinking frequency question is elicited by asking the respondent in the last three months, on average, how many days a week have they had a drink. On the other hand, SHARE surveys respondents' frequency of drinking using a set of categories which have changed wave to wave.

The HRS surveys respondents' number of drinks by eliciting the number of drinks the respondent drinks on days when they drink in all waves. SHARE also asks this in a similar manner in Waves 2, 4, and 5. On the other hand, starting in SHARE Wave 6, SHARE elicits the number of drinks the respondent drank in the last 7 days.

In the HRS, starting in Wave 3, the binge drinking frequency question is elicited by asking the respondent in the last three months, how many days have they had four or more drinks on one occasion. SHARE also asks this in a similar manner in Wave 2. On the other hand, starting in SHARE Wave 4, SHARE elicits the respondent's binge drinking frequency by asking the respondent in the last three months, how many days have they had six or more drinks on one occasion. In addition, starting in Wave 4, SHARE surveys respondent's binge drinking frequency using a set of categories.

sWsmokef	1-2, 6-9	sWsmokef:WW S amount smokes per day	Cont

How Constructed

rWsmokev indicates whether the respondent reports ever having smoked cigarettes, pipes, or cigars daily for a period of at least one year. The answer to the respondent's first ever-smoked daily question is carried forward in subsequent waves. A code of 0 indicates that the respondent has never smoked daily. A code of 1 indicates that the respondent has ever smoked daily. In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire, were asked questions about smoking. Those that weren't asked are assigned special missing value (.c) in Wave 7. When respondents don't know, refuse to answer, or are missing, **rWsmokev** is assigned special missing values (.d), (.r), (.m), respectively. **rWsmokev** is set to plain missing (.) for respondents who did not respond to the current wave.

sWsmokev records whether the respondent's spouse has ever smoked daily for a period of at least one year and is taken directly from the spouse's **rWsmokev**. In addition to the special missing codes used in **rWsmokev**, **sWsmokev** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWsmoken indicates whether the respondent reports smoking cigarettes, pipes, or cigars at the present time. This question is only asked if the respondent reports having ever smoked daily. In Waves 1 and 6, **rWsmoken** is assigned a value of 0 if the respondent does not currently smoke or has never smoked. In Waves 2 through 5, **rWsmoken** is assigned a value of 0 if the respondent does not current smoke, has never smoked, or has quit smoking since a previous interview. A code of 1 indicates that the respondent smokes at the present time. When respondents don't know, refuse to answer, or are missing, **rWsmoken** is assigned special missing values (.d), (.r), (.m), respectively. In Wave 6, respondents who had been previously interviewed are not asked about smoking at the present time and are assigned special missing (.q). In Wave 7, only new respondents and respondents who had previously reported ever smoking or smoking at the last interview are asked about smoking currently and are assigned special missing (.q). In addition, in Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview) were asked questions about smoking. Those that weren't asked are assigned special missing value (.c) in Wave 7. **rWsmoken** is set to plain missing (.) for respondents who did not respond to the current wave.

sWsmoken records whether the respondent's spouse smokes at the present time and is taken directly from **rWsmoken**. In addition to the special missing codes used in **rWsmoken**, **sWsmoken** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWsmokef indicates the number of cigarettes smoked per day. In Waves 1 and 2, respondents are asked separately the number of cigarettes, pipes, and cigars smoked per day, but only the number of cigarettes is used to create **rWsmokef**. Starting in Wave 6, respondents are only asked about the number cigarettes, they are asked for the average number of cigarettes smoked per day. If the respondent reports never smoking or not currently smoking, then **rWsmokef** is set to 0. If the respondent reports smoking but not smoking cigarettes, then **rWsmokef** is also set to 0. When respondents don't know, refuse to answer, or are missing, **rWsmokef** is assigned special missing values (.d), (.r), (.m), respectively. In Wave 6, respondents who had been previously interviewed are not asked about smoking at the present time and are assigned special missing (.q). In Wave 7, only new respondents and respondents who had previously reported ever smoking or smoking at the last interview are asked about smoking currently and are assigned special missing (.q). In addition, in Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire, were asked questions about smoking. Those that weren't asked are assigned special missing value (.c) in Wave 7. **rWsmokef** is set to plain missing (.) for respondents who did not respond to the current wave.

sWsmokef records the number of cigarettes the respondent's spouse smokes per day, and is taken directly from **rWsmokef**. In addition to the special missing codes used in **rWsmokef**, **sWsmokef** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 1 and starting in Wave 6, **rWsmoken** is defined using the respondent's answers to questions about ever smoking daily and smoking at the present time. In Waves 2 through 5, **rWsmoken** is defined using the respondent's answers to questions about ever smoking daily, smoking at the present time, and quitting smoking since the last interview. In Wave 6, respondents who had been previously interviewed are not asked about smoking at the present time. In Wave 7, respondents who had been previously interviewed and reported never smoking or not smoking in the last interview are not asked about smoking at the present time. In addition, in Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular rather than the condensed questionnaire, were asked questions about smoking.

In Waves 1 and 2, the average number of cigarettes, pipes, and cigars or cigarillos smoked per day is asked separately if the respondent reports smoking each product, but **rWsmokef** only includes the number of cigarettes smoked per day. The amount of smoking is not asked at all in Waves 4 and 5. Starting in Wave 6, the average number of cigarettes smoked per day is asked if the respondent reports smoking cigarettes, and does not ask for the amount of pipes, cigars or cigarillos, or e-cigarettes with nicotine solution smoked.

Cross-Study Differences with the HRS

In the SHARE, respondents are asked whether they have ever smoked daily for a period of at least one year. In the HRS, respondents are asked whether they have ever smoked (regardless of whether the smoking was daily and not given a definitive period). Consequently, **rWsmokev** in the Gateway Harmonized SHARE captures a different concept than **rWsmokev** in the RAND HRS. This difference also affects **rWsmoken** in the Gateway Harmonized SHARE because of the question routing explained above. Only SHARE respondents who answered that they have ever smoked daily for a period of at least one year were asked whether they smoke currently. In the HRS, all respondents who reported that they had ever smoked (regardless of whether the smoking was daily for a specific period) were directed to the question ever smoke currently. These two sets of measures should not be considered exactly comparable to the correlating RAND HRS measures.

In the HRS, the question about whether a person ever smoked daily is only asked at the respondent's first interview. For each respondent the answer to such question is carried forward in subsequent waves.

The Harmonized HRS includes **rWsmokef**, indicating the number of cigarettes smoked per day. The HRS asks this question only of current smokers, while the SHARE asks this question of current and former smokers. As such, **rWsmokef** in the Gateway Harmonized SHARE has been created to only include this information for current smokers in order to retain comparability with this measure in the Harmonized HRS and other Harmonized datasets.

Health Behaviors: Preventive Health

Variable	Waves	Label	Type
rWflusht1y	8-9	rWflusht1y:WW R had flu vaccination since last year	Categ
sWflusht1y	8-9	sWflusht1y:WW S had flu vaccination since last year	Categ
rWmammog	8-9	rWmammog:WW R had mammogram in last two years	Categ
sWmammog	8-9	sWmammog:WW S had mammogram in last two years	Categ
rWcoloncr	8-9	rWcoloncr:WW R had colon cancer screening in last two years	Categ
sWcoloncr	8-9	sWcoloncr:WW S had colon cancer screening in last two years	Categ

How Constructed

These variables indicate the preventive healthcare received by the respondents. **rWflusht1y** indicates whether the respondent had a flu vaccination in the last year, and is coded as follows: 0.No, and 1.Yes. **rWmammog** indicates whether the respondent had a mammogram (x-ray of the breast) in the last two years, and is coded as follows: 0.No, and 1.Yes. It is assigned special missing value (.g) if the respondent is a man and so was not asked about mammograms. **rWcoloncr** indicates whether the respondent had a Colon Cancer Screening, such as test for detecting hidden blood in your stool, sigmoidoscopy or colonoscopy in the last two years, and is coded as follows: 0.No, and 1.Yes. Don't know, refused, or other missing responses of these variables are assigned special missing codes (.d), (.r), and (.m), respectively. These variables are set to plain missing (.) for respondents who did not respond to the current wave.

sWflusht1y indicates whether the respondent's spouse had a flu vaccination in the last year and is taken directly from the spouse's **rWflusht1y**. **sWmammog** indicates whether the respondent's spouse had mammogram in the last two years and is taken directly from the spouse's **rWmammog**. **sWcoloncr** indicate whether the respondent's spouse had Colon Cancer Screening in last two years and is taken directly from the spouse's **rWcoloncr**. In addition to the special missing codes used in **rWflusht1y**, **rWmammog**, and **rWcoloncr**, **sWflusht1y**, **sWmammog**, and **sWcoloncr** employ the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

These questions are asked starting in Wave 8.

Cross-Study Differences with the HRS

In the SHARE, respondents are asked whether they had a flu vaccination since last year, while in the HRS, respondents are asked whether they had a flu vaccination in the last two years. In the SHARE, respondents are asked whether they had colon cancer screening in the last two years, while in the HRS, respondents are asked whether they had colon cancer screening in the last two years for Wave 11, and whether they had colon cancer screening in the last four years in Wave 12.

sWshlrtc_f	2, 4-9	sWshlrtc_f:ww S Flag calc chg self-reported hlth	Categ
rWshlrtc_s	2	rWshlrtc_s:ww R self-reported change of health	Categ
sWshlrtc_s	2	sWshlrtc_s:ww S self-reported change of health	Categ

How Constructed

rWshlrtc is the calculated change in self-reported health status from the last self-report to the current interview.

The derivation of **rWshlrtc** is:

$$\mathbf{rWshlrtc} = \mathbf{rWshlt} - \mathbf{rPshlt}$$

where 'w' means current wave and 'p' means the wave with the last self-report of health. For example, if an individual responded to Waves 1 and 2, $\mathbf{r2shlrtc} = \mathbf{r2shlt} - \mathbf{r1shlt}$. Since a lower number means better health in the **rWshlt** variables, a positive value for **rWshlrtc** indicates a decline in self-rated health.

Don't know, refused, or other missing responses to **rWshlrtc** are assigned special missing values (.d), (.r), (.m), respectively. **rWshlrtc** is set to special missing (.c) if the respondent did not have a previous interview. **rWshlrtc** is set to blank missing if the respondent did not participate in the current wave.

sWshlrtc is taken directly from the respondent's spouse's responses to **rWshlrtc**. In addition to the special missing values used in **rWshlrtc**, **sWshlrtc** employs two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWshlrtc_f indicates how far back the last self-report of health was. A code of 0 indicates that the previous interview was the 1st wave. A code of 1 indicates that the previous interview was the 2nd wave, and so on. A code of 9 indicates that the respondent was not previously interviewed or was interviewed but has no prior self-reported health status. Don't know, refused, or other missing responses to **rWshlrtc_f** are assigned special missing values (.d), (.r), (.m), respectively. **rWshlrtc_f** is set to blank missing if the respondent did not participate in the current wave.

sWshlrtc_f indicates how far back the respondent's spouse's last report of health was and is taken directly from the spouse's responses in **rWshlrtc_f**. Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWshlrtc_s is the self-reported change in health this wave compared to health in the previous wave. This was only asked in Wave 2 to respondents who had completed the Wave 1 questionnaire. Respondents were first asked, "Compared with your health when we talked with you in [previous interview], would you say that your health is better now, about the same, or worse?" If the respondent said better or worse, the respondent was asked if it was much or somewhat better or worse. **rWshlrtc_s** is coded as follows: 1.much better, 2.somewhat better, 3.about the same, 4.somewhat worse, 5.much worse. Don't know, refused, or other missing responses to **rWshlrtc_s** are assigned special missing values (.d), (.r), (.m), respectively. **rWshlrtc_s** is set to special missing (.t) if the respondent did not have a previous interview. **rWshlrtc_s** is set to blank missing if the respondent did not participate in the current wave.

sWshlrtc_s is the self-reported change in health for the respondent's spouse and is taken directly from the spouse's responses in **rWshlrtc_s**. In addition to the special missing codes used in **rWshlrtc_s**, **sWshlrtc_s** employs two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Self-reported change in health this wave compared to health in the previous wave is only available in Wave 2 of SHARE. It was not asked in any other waves.

Cross-Study Differences with the HRS

rWshl1tc is comparable between the RAND HRS and the SHARE. However, unlike the HRS, the SHARE asks for a self-report of the change in health between waves in Wave 2, while the HRS never asks this question.

sWhspnit1y	1-2, 4-9	sWhspnit1y:ww S # Nights in hosp, pr 12 mos	Cont

How Constructed

rWhosp1y indicates whether the respondent reports any overnight hospital stay in the last 12 months. If the respondent reports any overnight hospital stay, **rWhsptim1y** is the reported number of stays from 1 to 10 and **rWhspnit1y** is the reported number of nights over all stays from 1 to 365. **rWhsptim1y** and **rWhspnit1y** are set to 0 if the respondent reports no overnight hospital stay in the last 12 months. Don't know, refuse, and other missing responses to **rWhosp1y**, **rWhsptim1y**, and **rWhspnit1y** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWhosp1y, **sWhsptim1y**, and **sWhspnit1y** give this information for the respondent's spouse or partner and are taken directly from the respondent's spouse's values to **rWhosp1y**, **rWhsptim1y**, and **rWhspnit1y**. In addition to the special missing codes used in **rWhosp1y**, **rWhsptim1y**, and **rWhspnit1y**, **sWhosp1y**, **sWhsptim1y**, and **sWhspnit1y** employ the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

In SHARE, the reference period is 12 months. In RAND HRS, the reference period is since last interview or last 2 years for most of the waves.

sWnrsnit1y	1-2, 4-9	sWnrsnit1y:WW S # Nights in Nurs home, pr 12 mos	Cont

How Constructed

rWnrshom1y indicates whether the respondent reports any overnight nursing home stay in the last 12 months. If the respondent reports any overnight nursing home stay, **rWnrstim1y** is the reported number of stays and **rWnrsnit1y** is the reported number of nights over all stays. **rWnrsnit1y** is constructed by multiplying the reported weeks stayed in a nursing home by 7. If the respondent did not report any nursing home stay, then **rWnrstim1y** and **rWnrsnit1y** are set to zero. In Wave 5, respondents were not asked about the number of nursing home stays in the past 12 months. Starting in Wave 2, if the respondent reports living in a nursing home at the time of the interview, then **rWnrshom1y** is coded as 1 and **rWnrstim1y** and **rWnrsnit1y** are coded as special missing value (.n). Don't know, refuse, and other missing responses to **rWnrshom1y**, **rWnrstim1y**, and **rWnrsnit1y** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWnrshom1y, **sWnrstim1y**, and **sWnrsnit1y** give this information to the respondent's spouse or partner and are taken directly from the respondent's spouse's values to **rWnrshom1y**, **rWnrstim1y**, and **rWnrsnit1y**. In addition to the special missing codes used in **rWnrshom1y**, **rWnrstim1y**, and **rWnrsnit1y**, **sWnrshom1y**, **sWnrstim1y**, and **sWnrsnit1y** employ the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Starting in Wave 2, respondents living in nursing homes are not asked about other nursing home stays.

In Wave 5, respondents were not asked about the number of nursing home stays in the past 12 months.

Cross-Study Differences with the HRS

In SHARE, the reference period is 12 months. In RAND HRS, the reference period is since last interview or last 2 years for most of the waves.

Health Care Utilization: Doctor

Variable	Waves	Label	Type
rWdoctor1y	1-2, 4-9	rWdoctor1y:wW R doctor visit, pr 12 mos	Categ
sWdoctor1y	1-2, 4-9	sWdoctor1y:wW S doctor visit, pr 12 mos	Categ
rWdoctim1y	1-2, 4-9	rWdoctim1y:wW R # doctor visits, pr 12 mos	Cont
sWdoctim1y	1-2, 4-9	sWdoctim1y:wW S # doctor visits, pr 12 mos	Cont

How Constructed

rWdoctor1y indicates whether the respondent reports any doctor visit in the last 12 months. For doctor visits, the question asks how many times the respondent has seen or talked to a medical doctor including emergency room or outpatient clinic visits. The question text instructs the respondent not to include hospital stays or dentist visits. **rWdoctor1y** is assigned a value of 0 if the respondent reported no doctor visits, and is assigned a value of 1 if the respondent reported at least 1 doctor visit. **rWdoctim1y** is the reported number of visits, including a value of 0 if the respondent did not report any doctor visits. If the number of visits is more than 98, then the number of visits is reported as 98. Don't know, refuse, and other missing responses to **rWdoctor1y** and **rWdoctim1y** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWdoctor1y and **sWdoctim1y** give this information for the respondent's spouse or partner and are taken directly from the respondent's spouse's values to **rWdoctor1y** and **rWdoctim1y**. In addition to the special missing codes used in **rWdoctor1y** and **rWdoctim1y**, **sWdoctor1y** and **sWdoctim1y** employ the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

For **rWdoctor1y** and **rWdoctim1y**, in Waves 1, 2, and 4, respondents are asked the number of times they have seen or talked to a medical doctor. In Wave 5, respondents are asked the number of times they have seen or talked to a medical doctor or qualified nurse. In Waves 1, 2, 4, and 5, the maximum number of doctor visits reported is 98. Starting in Wave 6, respondents are asked the number of times they have seen or talked to a medical doctor or qualified/registered nurse. Starting in Wave 6, the maximum number of doctor visits reported is 365 or 366 depending on the wave.

Cross-Study Differences with the HRS

In SHARE, the reference period is 12 months. In RAND HRS, the reference period is since last interview or last 2 years for most of the waves.

In SHARE, the question text instructs the respondent not to include any hospital stays and dentist visits. In RAND HRS, the question text instructs the respondent only not to include any hospital stays.

Health Care Utilization: Home Care

Variable	Waves	Label	Type
rWhomcar1y	1-2, 5-9	rWhomcar1y:WW R Home hlth care, pr 12 mos	Categ
sWhomcar1y	1-2, 5-9	sWhomcar1y:WW S Home hlth care, pr 12 mos	Categ

How Constructed

rWhomcar1y indicates whether the respondent reports any home health care in the last 12 months. **rWhomcar1y** is assigned a value of 0 if the respondent reports no home health care, and is assigned a 1 if the respondent reports receiving any professional or paid service in their own home. In Waves 1 and 2, this includes professional or paid nursing or personal care, professional or paid home help for domestic tasks that you could not perform yourself due to health problems, or meals-on-wheels. Starting in Wave 5, the question specifies that the help was required due to a physical, mental, emotional or memory problem, and includes help with personal care, help with domestic tasks, meals-on-wheels, or help with other activities. In Waves 1 and 2 and starting in Wave 6, if the respondent lives in a nursing home at the time of the interview (see **rWnrshom1y**), then **rWhomcar1y** is set to (.n). Don't know, refuse, and other missing responses to **rWhomcar1y** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

The question is not asked in Wave 4, but is asked again starting in Wave 5. In Wave 5, an additional option of "help with other activities" was added to the questionnaire.

Please note that Switzerland and Greece have a large number of (.m) missings in Wave 1, and Switzerland and Poland have a large number of (.m) missings in Wave 2. These missings are most likely due to a routing error in these countries, in which responses to **HC029** were misnumbered and so **HC032** was not asked when it should have been.

sWhomcar1y gives this information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWhomcar1y**. In addition to the special missing codes used in **rWhomcar1y**, **sWhomcar1y** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

The number of weeks per year the respondent received help with personal care, domestic tasks, or meals-on-wheels is provided in **rWrpuofcarewpy**. The average number of hours per week the respondent received help with personal care or domestic tasks is provided in **rWrpuofcarehpw**. These variables are provided in Section L: Assistance and Caregiving of this codebook, and is available for Waves 1 and 2 and starting in Wave 7.

Cross Wave Differences in SHARE

In Wave 1, there were initially routing problems due to wrong category numbers when respondents were asked if they had spent a night in a nursing home. This routing problem was present in the questionnaires in France, Greece, Spain, and Switzerland. This resulted in respondents who stated that they permanently live in nursing homes being unnecessarily asked this question.

Please note that Switzerland and Greece have a large number of (.m) missings in Wave 1, and Switzerland and Poland have a large number of (.m) missings in Wave 2. These missings are most likely due to a routing error in these countries, in which responses to **HC029** were misnumbered and so **HC032** was not asked when it should have been.

The question is not asked in Wave 4, but is asked again starting in Wave 5. Starting in Wave 6, respondents living in nursing homes are not asked about receipt of home care.

In Waves 1 and 2, the question states, "Please look at card [#]. During the last twelve months, did you receive in your own home any of the kinds of care mentioned on this card?", and respondents are shown a card with the following options: "1. Professional or paid nursing or personal care, 2. Professional or paid home help, for domestic tasks that you could not perform yourself due to health problems, 3. Meals-on-wheels, 96. None of these." Starting in Wave 5, the question states, "We already talked about the difficulties you may have with various activities because of a health problem. Please look at

card [#]. During the last twelve months, that is since [year and month], did you receive in your home any professional or paid services listed on this card due to a physical, mental, emotional or memory problem?”, and respondents are shown a card with the following options: “1.Help with personal care (e.g. getting in and out of bed, dressing, bathing and showering), 2.Help with domestic tasks (e.g. cleaning, ironing, cooking), 3.Meals-on-wheels (i.e. ready made meals provided by a municipality or a private provider), 4.Help with other activities (e.g. filling a drug dispenser), 96.None of the above.”

Cross-Study Differences with the HRS

In SHARE, the reference period is 12 months. In RAND HRS, the reference period is since last interview or last 2 years for most of the waves.

Health Care Utilization: Private Provider

Variable	Waves	Label	Type
rWpricar1y	1-2	rWpricar1y:wW R receive care from private provider, pr 12 mos	Categ
sWpricar1y	1-2	sWpricar1y:wW S receive care from private provider, pr 12 mos	Categ

How Constructed

rWpricar1y indicates whether the respondent reports receiving any care from private providers in the last 12 months. The question asks whether the respondent received any care from private providers that they paid by themselves or through a private insurance because they would have waited too long, or they could not get as much as needed in the National Health System. This question is skipped for Austria, Belgium, and Germany in Wave 1, and for Belgium and Germany in Wave 2, in which case **rWpricar1y** is set to (.q), not asked for these countries. Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

The question is not asked starting in Wave 4.

sWpricar1y gives this information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWpricar1y**. In addition to the special missing codes used in **rWpricar1y**, **sWpricar1y** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

This question is not asked for Austria, Belgium, and Germany in Wave 1, and for Belgium and Germany in Wave 2. For these countries, **rWpricar1y** is set to (.q), not asked.

The question is not asked starting in Wave 4.

Cross-Study Differences with the HRS

In SHARE, the reference period is 12 months. In RAND HRS, the reference period is since last interview or last 2 years for most of the waves.

Health Care Utilization: Take Prescription Drugs

Variable	Waves	Label	Type
rWdrugs1w	1-2, 4-9	rWdrugs1w:WW R reg take rx, prv week	Categ
sWdrugs1w	1-2, 4-9	sWdrugs1w:WW S reg take rx, prv week	Categ

How Constructed

rWdrugs1w indicates whether the respondent reports taking any medication at least once a week for a list of health conditions; the list of health condition includes:

1. high blood cholesterol
2. high blood pressure
3. coronary or cerebrovascular diseases
4. other heart disease
5. asthma
6. diabetes
7. joint pain or for joint inflammation
8. other pain(e.g. headache, backpain, etc.)
9. sleep problems
10. anxiety or depression
11. osteoporosis, hormonal
12. osteoporosis, other than hormonal
13. stomach burns
14. chronic bronchitis
15. other drugs

Starting in Wave 5, SHARE adds suppressing inflammation (only glucocorticoids or steroids) in the health condition list, removes asthma, and begins asking about taking drugs for osteoporosis a single time; no differentiation was made between hormonal or other than hormonal. If the respondent reports taking at least one medication, once a week, then **rWdrugs1w** is coded as 1, otherwise it is coded as 0. Don't know, refuse, and other missing responses to **rWdrugs1w** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWdrugs1w indicates whether the current wave's spouse reports taking any medication at least once a week, and its values are taken from **rWdrugs1w**. In addition to the special missing codes employed by **rWdrugs1w**, **sWdrugs1w** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Starting in Wave 5, SHARE adds suppressing inflammation (only glucocorticoids or steroids) in the health condition list, removes drugs for asthma, and inquires about osteoporosis in a single question.

Cross-Study Differences with the HRS

In RAND HRS, **rWdrugs** indicates whether the respondent has regularly taken drugs in the previous 2 years, or since the last wave. However in the Gateway Harmonized SHARE, **rWdrugs1w** indicates whether the respondent takes drugs at least once a week.

Health Care Utilization: Dental Visit

Variable	Waves	Label	Type
rWdentst1y	1-2, 5-9	rWdentst1y:WW R dental visit, prv yr	Categ
sWdentst1y	1-2, 5-9	sWdentst1y:WW S dental visit, prv yr	Categ

How Constructed

rWdentst1y indicates whether the respondent reports seeing a dentist or dental hygienist within the last year. If the respondent reports seeing a dentist, then **rWdentst1y** is coded as 1, otherwise it is coded as 0. Don't know, refuse, and other missing responses to **rWdentst1y** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWdentst1y indicates whether the current wave's spouse reports seeing a dentist within the last year, and its values are taken from **rWdentst1y**. In addition to the special missing codes employed by **rWdentst1y**, **sWdentst1y** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

This question is not asked in Wave 4.

Cross-Study Differences with the HRS

In RAND HRS, **rWdentst** indicates whether the respondent has had a dental visit in the previous 2 years, or since the last wave. However in the Gateway Harmonized SHARE, **rWdentst1y** indicates whether the respondent has had a dental visit in the last year.

Health Insurance: Covered by Government Health Insurance Program

Variable	Waves	Label	Type
rWhigov	1	rWhigov:ww R cover by Gov Health Ins	Categ
sWhigov	1	sWhigov:ww S cover by Gov Health Ins	Categ

How Constructed

rWhigov indicates whether the respondent is covered by government health insurance program, i.e., National Health Insurance System. **rWhigov** is coded as 0 for no and 1 for yes. This question is skipped for the following countries: Sweden, Spain, Italy, Denmark, Greece, Switzerland, and Israel, in which case **rWhigov** is set to (.q), not asked for these countries. Don't know, refuse, and other missing responses to **rWhigov** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

This question is only asked in Wave 1.

sWhigov provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWhigov**. In addition to the special missing codes used in **rWhigov**, **sWhigov** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

This question is only asked in Wave 1.

Cross-Study Differences with the HRS

In RAND HRS, **rWhigov** includes different types of government insurance programs. In SHARE, **rWhigov** is only asking whether the respondent is covered by the National Health System.

Health Insurance: Covered by Voluntary Health Insurance

Variable	Waves	Label	Type
rWhiothp	1	rWhiothp:WW R cover by Voluntary Health Ins	Categ
sWhiothp	1	sWhiothp:WW S cover by Voluntary Health Ins	Categ

How Constructed

rWhiothp indicates whether the respondent is covered by any voluntary health insurance contract for different types of care. The different types of care include:

- Medical care with direct access to specialists
- Medical care with access to specialists through a general practitioner
- Medical care with unrestricted choice of doctors
- Medical care with limited choice of doctors
- Dental care
- Full coverage of drug expenses
- Partial coverage of drug expenses
- Hospital care with unrestricted choice of hospitals and clinics
- Hospital care with limited choice of hospitals and clinics
- Long term care in nursing home
- Nursing care at home in case of chronic disease or disability
- Home help

rWhiothp is set to 1 if the respondent reports being covered by at least one of the types of care. **rWhiothp** is set to 0 if the respondent reports not being covered by any of the types of care. **rWhiothp** is set to (.g) if the respondent is covered by a National Health Insurance System because this question is not asked. This question is skipped for the following countries: Sweden, Spain, Italy, Denmark, Greece, Switzerland, and Israel, in which case **rWhiothp** is set to (.q), not asked for these countries. Don't know, refuse, and other missing responses to **rWhiothp** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

rWhiothp is only asked in Wave 1.

sWhiothp provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWhiothp**. In addition to the special missing codes used in **rWhiothp**, **sWhiothp** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

This question is only asked in Wave 1.

Cross-Study Differences with the HRS

Similar to the RAND HRS measure **rWhiothp**, **rWhiothp** in the Gateway Harmonized SHARE captures whether a respondent has other health insurance plans. Different from the HRS, SHARE uses a different list of possible other health insurances to survey whether the respondent has another health plan.

Health Insurance: Covered by Dental Insurance

Variable	Waves	Label	Type
rWhident	1	rWhident:WW R cover by Dental Ins	Categ
sWhident	1	sWhident:WW S cover by Dental Ins	Categ

How Constructed

rWhident indicates whether the respondent is covered by dental insurance. **rWhident** is coded as 1.yes if the respondent indicates having dental care coverage from a voluntary health insurance contract. **rWhident** is coded as 0.no if the respondent indicates not having dental care coverage from a voluntary health insurance contract (see **rWhiothp** for more detail about voluntary health insurance contract). **rWhident** is set to (.g) if the respondent is covered by a National Health Insurance System because this question is not asked. This question is skipped for the following countries: Sweden, Spain, Italy, Demark, Greece, Switzerland, and Israel, in which case **rWhident** is set to (.q), not asked for these countries. Don't know, refuse, and other missing responses to **rWhident** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

This question is only asked in Wave 1.

sWhident provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWhident**. In addition to the special missing codes used in **rWhident**, **sWhident** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

This question is only asked in Wave 1.

Cross-Study Differences with the HRS

A corollary variable capturing dental insurance is not included in the RAND HRS.

Health Insurance: Drug Expenses Covered

Variable	Waves	Label	Type
rWhidrug	1	rWhidrug:WW R cover by Drug expenses	Categ
sWhidrug	1	sWhidrug:WW S cover by Drug Expenses	Categ

How Constructed

rWhidrug indicates whether the respondent has any coverage of drug expenses. **rWhidrug** is coded as 1.yes if the respondent indicates having full or partial coverage of drug expenses from a voluntary health insurance contract. **rWhidrug** is coded as 0.no if the respondent indicates not having full or partial coverage of drug expenses from a voluntary health insurance contract (see **rWhiothp** for more detail about voluntary health insurance contract). **rWhidrug** is set to (.g) if the respondent is covered by a National Health Insurance System because this question is not asked. This question is skipped for the following countries: Sweden, Spain, Italy, Denmark, Greece, Switzerland, and Israel, in which case **rWhidrug** is set to (.q), not asked for these countries. Don't know, refuse, and other missing responses to **rWhidrug** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

This question is only asked in Wave 1.

sWhidrug provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWhidrug**. In addition to the special missing codes used in **rWhidrug**, **sWhidrug** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Out of Pocket Expenditure: Hospitalization

Variable	Waves	Label	Type
rWoophos1y	1-2, 5-7	rWoophos1y:WW R hospitalization oop expenditure, prv yr	Cont
sWoophos1y	1-2, 5-7	sWoophos1y:WW S hospitalization oop expenditure, prv yr	Cont
rWoophosf1y	1-2, 5-7	rWoophosf1y:WW InsFlag: R hospitalization oop expenditure, prv yr	Categ
sWoophosf1y	1-2, 5-7	sWoophosf1y:WW InsFlag: S hospitalization oop expenditure, prv yr	Categ

How Constructed

This question is asked in Waves 1, 2, and 5-7, it is not asked in Waves 4, 8 and 9. For all available waves, imputed out-of-pocket expenditures are provided at the individual-level.

rWoophos1y indicates the amount the respondent reported spending out-of-pocket on hospitalizations in the previous year. **rWoophos1y** is based on SHARE derived variables which include imputations for missing values. **rWoophosf1y** is the imputation flag indicating whether the value of **rWoophos1y** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this expenditure and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. In Wave 7, respondents given the condensed questionnaire are not asked this question, and **rWoophos1y** is assigned special missing value (.c) and **rWoophosf1y** is assigned a code of -4. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWoophos1y indicates the amount the current wave's spouse reports spending out-of-pocket on hospitalizations in the previous year, and its values are taken from **rWoophos1y**. **sWoophosf1y** indicates whether the value of **sWoophos1y** was imputed or not, and its values are taken from **rWoophosf1y**. **sWoophos1y** and **sWoophosf1y** employ the special missing value (.u), when the respondent reports not being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

This question is not asked in Wave 4, 8 and 9.

Starting in Wave 6, the respondent is asked how much they themselves paid for their stays in hospitals or other health care facilities in the last 12 months, while previous waves did not include "other health care facilities". Also starting in Wave 6, the question asks the respondent to include costs for non-care related costs such as meals, while previous waves do not ask the respondent to make this distinction.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), meaning those who were given the regular questionnaire in Wave 7, were asked this question.

Cross-Study Differences with the HRS

rWoophos1y is not calculated in the RAND HRS.

How Constructed

This question is asked in Waves 1, 2, and 5-7, it is not asked in Waves 4, 8 and 9. For all available waves, imputed out-of-pocket expenditures are provided at the individual-level.

rWoopdoc1y indicates the amount the respondent reported spending out-of-pocket on outpatient care in the previous year. **rWoopdoc1y** is based on SHARE derived variables which include imputations for missing values. **rWoopdocf1y** is the imputation flag indicating whether the value of **rWoopdoc1y** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this expenditure and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. In Wave 7, respondents given the condensed questionnaire are not asked this question, and **rWoopdoc1y** is assigned special missing value (.c) and **rWoopdocf1y** is assigned a code of -4. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWoopdoc1y indicates the amount the current wave's spouse reports spending out-of-pocket on outpatient care in the previous year, and its values are taken from **rWoopdoc1y**. **sWoopdocf1y** indicates whether the value of **sWoopdoc1y** was imputed or not, and its values are taken from **rWoopdocf1y**. **sWoopdoc1y** and **sWoopdocf1y** employ the special missing value (.u), when the respondent reports not being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

This question is not asked in Wave 4, Wave 8, or in Wave 9.

In Waves 1 and 2, respondents are asked to include expenses for all health professionals, including dentists, for all labs, exams, or therapies prescribed by doctors and for outpatient surgery, but to exclude drug or alternative medicine expenses. Starting in Wave 5, respondents are asked to include expenses for visits to health professionals, excluding dentists, and for all diagnostic exams. Starting in Wave 6, there is an additional clarification that the expenses are amounts they paid without getting reimbursed by a health insurance, their national health system, or a third party payer.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), meaning those who were given the regular questionnaire in Wave 7, were asked this question.

Cross-Study Differences with the HRS

rWoopdoc1y is not calculated in the RAND HRS.

How Constructed

For all waves where imputation values are available, imputed out-of-pocket expenditures for drugs and home care/nursing home are provided at the individual-level.

rWoopdrug1y and **rWoophcnh1y** indicate the amount the respondent reported spending out-of-pocket on drugs and home care/nursing home, respectively, in the previous year. Respondents are asked about the out-of-pocket amount paid for day care, nursing homes, and home care services in a single question in Waves 1 and 2. In Wave 5 through 7, respondents are asked about the amount paid for home care services and nursing home stays in separate questions. The answers from these two questions are both included in the calculation of **rWoophcnh1y** in Waves 5-7. In Waves 1-2 and Waves 5-7, **rWoopdrug1y** and **rWoophcnh1y** are based on SHARE derived variables which include imputations for missing values. **rWoopdrugf1y** and **rWoophcnhf1y** are the imputation flags indicating whether the values of **rWoopdrug1y** and **rWoophcnh1y** were imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this expenditure and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Starting in Wave 8, the question regarding out-of-pocket costs for drugs is not asked, and the question regarding out-of-pocket costs for home care/nursing home is asked, but imputed values are not available yet. In Waves 2 and 7, respondents living in a nursing home are not asked about the cost of nursing homes so **rWoophcnh1y** is assigned special missing value (.n). In Wave 7, respondents given the condensed questionnaire are not asked this question, and **rWoopdrug1y** and **rWoophcnh1y** are assigned special missing value (.c) and **rWoopdrugf1y** and **rWoophcnhf1y** are assigned a code of -4. Therefore, **rWoopdrug1y** and **rWoophcnh1y** are not available starting from Wave 8. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWoopdrug1y and **sWoophcnh1y** indicate the amount the current wave's spouse reports spending out-of-pocket on drugs and home care/nursing home, respectively, in the previous year. Their values are taken from **rWoopdrug1y** and **rWoophcnh1y**. **sWoopdrugf1y** and **sWoophcnhf1y** indicate whether the values of **sWoopdrug1y** and **sWoophcnh1y** were imputed or not, and their values are taken from **rWoopdrugf1y** and **rWoophcnhf1y**. **sWoopdrug1y**, **sWoophcnh1y**, **sWoopdrugf1y**, and **sWoophcnhf1y** employ the special missing value (.u), when the respondent reports not being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWoopden1y indicates the amount the respondent reported spending out-of-pocket on dental visits in the previous year. If the respondent reports having no dental visits, then **rWoopden1y** is set to 0. In Wave 7, respondents given the condensed

questionnaire are not asked this question, and both variables are assigned special missing value (.c). **rWoopden1y** is not asked in Waves 1-4 or in Wave 8 and Wave 9. Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWoopden1y indicates the amount the current wave's spouse reports spending out-of-pocket on dental visits in the previous year. Its value is taken from **rWoopden1y**. In addition to the special missing codes employed by **rWoopden1y**, **sWoopden1y** employs the special missing value .u, when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

For **rWoopdrug1y**, respondents are asked about the out-of-pocket amount paid for prescription drugs in Waves 1 and 2, and about the amount paid for prescription drugs and drugs bought without a prescription in Waves 5-7. The question asking the amount paid for prescription drugs is not asked in Waves 4, 8 or 9.

For **rWoopphcnh1y**, respondents are asked about the out-of-pocket amount paid for day care, nursing homes, and home care services in a single question in Waves 1 and 2. In Waves 5-7, respondents are asked about the amount paid for home care services and nursing home stays in separate questions. Starting in Wave 7, respondents are asked about the amount paid for nursing home stays or stays in a residential care facility, whereas previous waves only asked about nursing home stays. The questions asking the amount paid for home care or nursing home stays are not asked in Wave 4. The question asking the amount paid for home care is not asked starting from Wave 8. While the amount paid for stays in nursing home was still asked in Wave 8 and Wave 9, the imputed value has not yet been provided by SHARE.

The amount paid for dental care is only asked starting in Wave 5, and is not asked starting from Wave 8.

For the amount paid for prescription drugs, home care, nursing home stays, and dental care, respondents are asked about their out-of-pocket expenses that were not reimbursed by a health insurance, their national health system, or a third party payer starting in Wave 6. Earlier waves ask respondent to not include expenses reimbursed by a health or long-term care insurance or more generally ask about the amount paid overall.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), meaning they were given the regular questionnaire in Wave 7, were asked these questions.

Cross-Study Differences with the HRS

These variables are not calculated in the RAND HRS.

Continuous Variable Distributions

Variable	N	Mean	Std.Dev	Minimum	Maximum	Total missing

How Constructed

rWoopmd1y is a summary variable indicating the total amount the respondent reported spending out-of-pocket on medical care in the previous year. In Waves 1 and 2, **rWoopmd1y** is the sum of **rWoophos1y**, **rWoopdoc1y**, **rWoopdrug1y**, and **rWoophcnhf1y**. Starting in Wave 5, **rWoopmd1y** is the sum of **rWoophos1y**, **rWoopdoc1y**, **rWoopdrug1y**, **rWoophcnhf1y**, and **rWoopden1y**. **rWoopmdf1y** is a flag indicating whether the values of **rWoophos1y**, **rWoopdoc1y**, **rWoopdrug1y**, or **rWoophcnhf1y** were imputed. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3 indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. A code of -1 indicates that the respondent did not provide an answer for **rWoopden1y** in Waves 5 forward and, as this variable has not been imputed, the total value can not be calculated and **rWoopmd1y** is missing. In Wave 7, respondents given the condensed questionnaire are not asked these questions, and **rWoopmd1y** is assigned special missing value (.c) and **rWoopmdf1y** is assigned a code of -4. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWoopmd1y indicates the total amount the current wave's spouse reports spending out-of-pocket on medical care in the previous year, and its values are taken from **rWoopmd1y**. **sWoopmdf1y** indicates whether the values of **sWoophos1y**, **sWoopdoc1y**, **sWoopdrug1y**, or **sWoophcnhf1y** were imputed or not, and its values are taken from **rWoopmdf1y**. **sWoopmd1y** and **sWoopmdf1y** employ the special missing value (.u), when the respondent reports not being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Waves 1 and 2, **rWoopmd1y** does not include the amount spent out-of-pocket on dental care, but the amount spent on dental care is included starting in Wave 5.

The amount spent out-of-pocket on medical care is not asked in Wave 4, 8 and 9. Only the amount spent out-of-pocket on nursing home stays is asked started from Wave 8, but an imputed value has not yet been provided by SHARE.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), meaning they were given the regular questionnaire in Wave 7, were asked these questions.

Please see the "Differences Between Waves" sections for **rWoophos1y**, **rWoopdoc1y**, **rWoopdrug1y**, **rWoophcnhf1y**, and **rWoopden1y** for specific differences.

Cross-Study Differences with the HRS

rWoopmd in the RAND HRS refers to the total out-of-pocket medical expenditure in the previous 2 years, or the period since the last interview. However, **rWoopmd1y** in Gateway Harmonized SHARE refers to the total out-of-pocket medical expenditure in the previous year.

rWoopmd in the RAND HRS has slightly different components than **rWoopmd1y** in SHARE based on different institutional arrangements in each country. However, the concepts are kept as similar as possible.

Continuous Variable Distributions

D. Cognition

Self-Reported Memory

Variable	Waves	Label	Type
rWslfmem	4-9	rWslfmem:wW r self-rated memory	Categ
sWslfmem	4-9	sWslfmem:wW s self-rated memory	Categ
rWpstmem	8-9	rWpstmem:wW r memory compared to past	Categ
sWpstmem	8-9	sWpstmem:wW s memory compared to past	Categ

How Constructed

rWslfmem provides a self-reported general rating of memory. **rWslfmem** is coded as follows: 1.excellent, 2.very good, 3.good, 4.fair, 5.poor. Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. Proxy respondents are not asked this question and so **rWslfmem** is assigned special missing (.p). In Waves 6 and 7, returning respondents are not asked this question and are assigned special missing (.q). Participants in the Wave 7 SHARELIFE questionnaire are not asked this question and are assigned special missing value (.c). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWslfmem provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWslfmem**. In addition to the special missing codes used in **rWslfmem**, **sWslfmem** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWpstmem provides a self-reported comparison of the respondent's memory compared to the time of their last interview. **rWpstmem** is coded as follows: 1.better, 2.same, 3.worse. Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. Proxy respondents are not asked this question and so **rWpstmem** is assigned special missing (.p). Respondents under the age of 60 at the time of the interview are not asked this question and are assigned special missing (.a). Baseline respondents are also not asked this question and are assigned special missing (.b). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWpstmem provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWpstmem**. In addition to the special missing codes used in **rWpstmem**, **sWpstmem** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Respondents were only asked about their self-rated memory starting in Wave 4. In Waves 4, 5, 8 and 9, it is asked for all the respondents, but in Waves 6 and 7, it is only asked of new interviewees. Participants in the Wave 7 SHARELIFE questionnaire are not asked this question.

The question about the respondent's memory compared to during their previous interview is asked starting in Wave 8.

Cross-Study Differences with the HRS

No differences known.

Immediate Word Recall

Variable	Waves	Label	Type
rWimrc	1-2, 4-9	rWimrc:WW r immediate word recall	Cont
sWimrc	1-2, 4-9	sWimrc:WW s immediate word recall	Cont

How Constructed

rWimrc provides a measure for immediate word recall. They are counts of the number of words from a 10 word list that were recalled correctly. Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. **rWimrc** is assigned special missing (.p) if the questions were skipped because the interview was completed partially or completely by proxy. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

In Waves 1 and 2, the word list was the same for all respondents. Starting in Wave 4, the respondents were randomly assigned one of four non-overlapping lists based on a random number ranging from 1 to 4.

sWimrc provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWimrc**. In addition to the special missing codes used in **rWimrc**, **sWimrc** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Waves 1 and 2, respondents were assigned the same word list.

Starting in Wave 4, respondents were randomly assigned one of four non-overlapping lists based on a random number ranging from 1 to 4. The word lists starting in Wave 4 are different from Waves 1 and 2.

Cross-Study Differences with the HRS

In SHARE Waves 1 and 2, the word list was not randomly assigned. In the HRS, starting in Wave 3, the word list was randomly assigned which is similar in SHARE Wave 4 and onward.

The word list in SHARE Waves 1 and 2 is different from HRS. SHARE Wave 4 and onward have the same word lists as in HRS.

The speed of reading was not specified for SHARE. HRS has a time limit up to 2 minutes.

Delayed Word Recall

Variable	Waves	Label	Type
rWdlrc	1-2, 4-9	rWdlrc:WW r delayed word recall	Cont
sWdlrc	1-2, 4-9	sWdlrc:WW s delayed word recall	Cont

How Constructed

rWdlrc provides a measure for delayed word recall. They are counts of the number of words from the 10 word immediate recall list that were recalled correctly after a delay spent answering other survey questions. Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. **rWdlrc** is assigned special missing (.p) if the questions were skipped because the interview was completed partially or completely by proxy. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

In Waves 1 and 2, the word list was the same for all respondents. Starting in Wave 4, the respondents were randomly assigned one of four non-overlapping lists based on a random number ranging from 1 to 4.

sWdlrc provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWdlrc**. In addition to the special missing codes used in **rWdlrc**, **sWdlrc** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Waves 1 and 2, respondents were assigned the same word list.

Starting in Wave 4, respondents were randomly assigned one of four non-overlapping lists based on a random number ranging from 1 to 4.

The questions asked during the period between immediate and delayed word recall tasks increased starting in Wave 4. Starting in Wave 4, the serial 7's test was added before the delayed word recall questions were asked.

Cross-Study Differences with the HRS

In SHARE Waves 1 and 2, the word list was not randomly assigned. In the HRS, starting in Wave 3, the word list was randomly assigned which is similar in SHARE Wave 4 and onward.

The word list in SHARE Waves 1 and 2 is different from HRS. SHARE Wave 4 and onward have the same word list as in HRS.

There are different questions that were administered in between the immediate and delayed recall between HRS and SHARE.

The speed of reading was not specified for SHARE. HRS has a time limit up to 2 minutes.

Word Recall Summary Score

Variable	Waves	Label	Type
rWtr20	1-2, 4-9	rWtr20:WW r recall summary score	Cont
sWtr20	1-2, 4-9	sWtr20:WW s recall summary score	Cont

How Constructed

rWtr20 is the summary score for total word recall. The total word recall summary variables sum the immediate and delayed word recall scores. It's the sum of **rWimrc** (range 0-10) and **rWdlrc** (range 0-10). Both **rWimrc** and **rWdlrc** must have non-missing values in order to calculate a value for **rWtr20**. Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. **rWtr20** is assigned special missing (.p) if the questions were skipped because the interview was completed partially or completely by proxy. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWtr20 provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWtr20**. In addition to the special missing codes used in **rWtr20**, **sWtr20** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Serial 7's

Variable	Waves	Label	Type
rWser7	4-9	rWser7:WW r serial 7s	Cont
sWser7	4-9	sWser7:WW s serial 7s	Cont

How Constructed

rWser7 provides the number of correct subtractions in the serial 7's test. This test asks the individual to subtract 7 from the prior number, beginning with 100 for five trials. Correct subtractions are based on the prior number given, so that even if one subtraction is incorrect subsequent trials are evaluated on the given (perhaps wrong) answer. Valid scores are 0-5. Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. **rWser7** is assigned special missing (.p) if the questions were skipped because the interview was completed partially or completely by proxy. Participants in the Wave 7 SHARELIFE questionnaire are not asked these questions and are assigned special missing value (.c). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

This task was given starting in Wave 4, and not given in Waves 1 and 2.

sWser7 provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWser7**. In addition to the special missing codes used in **rWser7**, **sWser7** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

This question was asked starting in Wave 4. It was not asked in Waves 1 and 2.

Participants in the Wave 7 SHARELIFE questionnaire are not asked this question.

Cross-Study Differences with the HRS

No differences known.

Continuous Variable Distributions

Variable	N	Mean	Std.Dev	Minimum	Maximum	Total missing

Backwards Counting

Variable	Waves	Label	Type
rWbwc20	8-9	rWbwc20:WW r backwards count from 20	Categ
sWbwc20	8-9	sWbwc20:WW s backwards count from 20	Categ

How Constructed

rWbwc20 indicates whether the respondent was able to successfully count backwards from 20. A code of 1 is assigned if the respondent correctly counted backwards for 10 successive numbers, starting from 20. A code of 0 is assigned if the respondent made errors while counting. Don't know, refused, or other missing responses to **rWbwc20** are assigned special missing values (.d), (.r), or (.m), respectively. **rWbwc20** is set to (.p) if the cognition questions were skipped because the interview was by proxy. Respondents under the age of 60 at the time of the interview are not asked this question and are assigned special missing (.a). Baseline respondents are also not asked this question and are assigned special missing (.b). **rWbwc20** is set to plain missing (.) for respondents who did not respond to the current wave.

sWbwc20 indicates whether the current wave's spouse was able to correctly count backwards from 20. Its values are taken from **rWbwc20**. In addition to the special missing codes used in **rWbwc20**, **sWbwc20** employs two additional special missing values: (.u) and (.v). If the respondent is not designated as coupled in the current wave and assumed to be single, the special missing value (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, the special missing value (.v) is used.

Cross Wave Differences in SHARE

These questions are asked starting in SHARE Wave 8.

Cross-Study Differences with the HRS

In the RAND HRS, **rWbwc20** is scored as 0 if the respondent was unsuccessful, 1, if the respondent was successful on their second try, and 2 if the respondent was successful on their first try. Starting in the HRS Wave 14, separate variables are created for web and face-to-face or telephone interviews, **rWbwc20w** and **rWbwc20p**, respectively. The RAND HRS also includes backwards counting from 86 in Waves 3 through 6 and imputation flag variables for all waves.

Categorical Variable Frequencies

	r8bwc20	r9bwc20

sWyr	1-2, 4-9	sWyr:WW s cognition date naming-year	Categ
rWdw	1-2, 4-9	rWdw:WW r cognition date naming-day of week	Categ
sWdw	1-2, 4-9	sWdw:WW s cognition date naming-day of week	Categ
rWorient	1-2, 4-9	rWorient:WW r cognition orient (summary date naming)	Cont
sWorient	1-2, 4-9	sWorient:WW s cognition orient (summary date naming)	Cont

How Constructed

rWdy, **rWmo**, **rWyr**, and **rWdw** indicate whether the respondent was able to report today's date correctly, including the day of the month, month, year, and day of the week, respectively. Each of these variables is coded 1 for a correct answer and 0 for an incorrect answer. In Waves 4 and 5, these questions are only asked of new interviewees, so if the questions were skipped because of re-interviewing, special missing value (.q) was assigned. Participants in the Wave 7 SHARELIFE questionnaire are not asked these questions and are assigned special missing value (.c).

rWorient indicates the orientation to date, month, year and day of the week. It is the summary measure for these 4 variables, and its values range from 0 to 4, the higher the score the better oriented. This variable is calculated using a SHARE derived variable, **orienti**, rather than adding together the values from **rWdy**, **rWmo**, **rWyr**, and **rWdw**.

Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. These variables are assigned special missing (.p) if the questions were skipped because the interview was completed partially or completely by proxy. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWdy, **sWmo**, **sWyr**, and **sWdw** provide the information for the respondent's spouse or partner and are taken directly from the respondent's spouse's values to **rWdy**, **rWmo**, **rWyr**, and **rWdw**. In addition to the special missing codes used in **rWdy**, **rWmo**, **rWyr**, and **rWdw**, **sWdy**, **sWmo**, **sWyr**, and **sWdw** employ the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Waves 1, 2, 6, 8, and 9, the questions were asked for all respondents. In Waves 4 and 5, these questions are only asked of new interviewees. Participants in the Wave 7 SHARELIFE questionnaire are not asked these questions.

Cross-Study Differences with the HRS

No differences known.

Object Naming

Variable	Waves	Label	Type
rWscis	8-9	rWscis:WW r scissors	Categ
sWscis	8-9	sWscis:WW s scissors	Categ
rWcact	8-9	rWcact:WW r cactus	Categ
sWcact	8-9	sWcact:WW s cactus	Categ
rWpharm	8-9	rWpharm:WW r pharmacy	Categ
sWpharm	8-9	sWpharm:WW s pharmacy	Categ

How Constructed

rWscis, **rWcact** and **rWpharm** indicate whether the respondent was able to correctly name these objects and place: cactus, scissors, and pharmacy respectively, based on a verbal description. For **rWscis**, the description was: "What do people usually use to cut paper?", while for **rWcact**, it was: "What do you call the kind of prickly plant that grows in the desert?". Lastly, for **rWpharm**, the description was: "Where do people usually go to buy medicine?" **rWscis**, **rWcact** and **rWpharm** are assigned a 1 if the respondent answers correctly and a 0 if they do not answer correctly. **rWcact**, **rWscis**, and **rWpharm** are set to special missing code (.p) if the cognition questions were skipped because the interview was by proxy. Don't know, refused, or other missing responses of **rWcact**, **rWscis**, and **rWpharm** are assigned special missing codes (.d), (.r), (.m), respectively. Respondents under the age of 60 at the time of the interview are not asked these questions and are assigned special missing (.a). Baseline respondents are also not asked these questions and are assigned special missing (.b). **rWcact**, **rWscis**, and **rWpharm** are set to plain missing (.) for respondents who did not respond to the current wave.

sWscis, **sWcact** and **sWpharm** indicate whether the current wave's spouse correctly named these objects, cactus and scissors, and are taken from the spouse's values to **rWscis**, **rWcact** and **rWpharm**. In addition to the special missing codes used in **rWscis**, **rWcact** and **rWpharm**, **sWscis**, **sWcact** and **sWpharm** employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The object and place naming questions were asked starting in Wave 8.

Cross-Study Differences with the HRS

The question asking the respondent to identify a pharmacy is not asked in the HRS.

Verbal Fluency Score

Variable	Waves	Label	Type
rWverbf	1-2, 4-9	rWverbf:WW r verbal fluency score	Cont
sWverbf	1-2, 4-9	sWverbf:WW s verbal fluency score	Cont

How Constructed

rWverbf is the verbal fluency score. It measures the speed and ease of verbal production. The respondents were asked to name animals within a limited time span of one minute. Acceptable animals include any member of the animal kingdom, real or mythical, including a species name, any accompanying breeds within the species, or male, female, and infant names within the species. The score is the sum of acceptable animals that range from 0 to 100. Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. **rWverbf** is assigned special missing (.p) if the questions were skipped because the interview was completed partially or completely by proxy. Participants in the Wave 7 SHARELIFE questionnaire are not asked this question and are assigned special missing value (.c). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWverbf provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWverbf**. In addition to the special missing codes used in **rWverbf**, **sWverbf** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Participants in the Wave 7 SHARELIFE questionnaire are not asked this question.

Cross-Study Differences with the HRS

The HRS includes this question starting in Wave 10. The HRS releases the total number of named animals and the number of incorrectly named animals, and the Harmonized HRS released **rWverbf** providing the number of correctly named animals. The SHARE releases the number of correctly named animals, which is provided in **rWverbf** in the Gateway Harmonized SHARE directly.

Numeracy Score

Variable	Waves	Label	Type
rWnumer_s	1-2, 4-9	rWnumer_s:wW r numeracy score	Cont
sWnumer_s	1-2, 4-9	sWnumer_s:wW s numeracy score	Cont

How Constructed

rWnumer_s is the summary measure that scores respondents' ability for mathematic performance. There are 4 questions that require respondents to do simple computations, such as computing the price of an object after a sale, the amount accrued as bank interest, and fraction-based calculations of the original price of an item.

rWnumer_s is taken from the SHARE generated variable **numeracy** and its values range from 1 to 5, 1 is a low score and 5 is a high score.

rWnumer_s is assigned special missing (.p) if the questions were skipped because the interview was completed partially or completely by proxy. Starting in Wave 4, the question is only asked of new interviewees. If the questions were skipped due to re-interviewing, then **rWnumer_s** is assigned special missing (.q). Baseline respondents are not asked these questions and are assigned special missing (.b). Participants in the Wave 7 SHARELIFE questionnaire are not asked these questions and are assigned special missing value (.c). Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWnumer_s provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWnumer_s**. In addition to the special missing codes used in **rWnumer_s**, **sWnumer_s** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Starting in Wave 4, the question is only asked of new interviewees. Participants in the Wave 7 SHARELIFE questionnaire are not asked these questions.

Cross-Study Differences with the HRS

There are 4 questions that were asked in SHARE. There are only 3 questions in HRS. Also some of the questions are different between HRS and SHARE.

In SHARE, the 4 questions are: 1. If the chance of getting a disease is 10 percent, how many people out of 1,000 (one thousand) would be expected to get the disease? 2. In a sale, a shop is selling all items at half price. Before the sale, a sofa costs 300 [local currency] How much will it cost in the sale? 3. A second hand car dealer is selling a car for 6,000 [local currency]. This is two-thirds of what it costs new. How much did the car cost new? 4. Let's say you have 2000 [local currency] in a savings account. The account earns ten percent interest each year. How much would you have in the account at the end of two years?

In HRS, the 3 questions are: 1. If the chance of getting a disease is 10 percent, how many people out of 1,000 would be expected to get the disease? 2. If 5 people all have the winning numbers in the lottery and the prize is two million dollars, how much will each of them get? 3. Let's say you have \$200 in a savings account. The account earns 10 percent interest per year. How much would you have in the account at the end of two years?

Drawing Test

Variable	Waves	Label	Type
rWdrawinf	8-9	rWdrawinf:WW r able to draw infinity symbol	Categ
sWdrawinf	8-9	sWdrawinf:WW s able to draw infinity symbol	Categ
rWdrawcube	8-9	rWdrawcube:WW r able to draw cube	Categ
sWdrawcube	8-9	sWdrawcube:WW s able to draw cube	Categ
rWdrawcl	8-9	rWdrawcl:WW r able to draw clock	Categ
sWdrawcl	8-9	sWdrawcl:WW s able to draw clock	Categ

How Constructed

rWdrawinf indicates whether the respondent was able to draw an infinity symbol. A 1 is assigned if the respondent drew the symbol, while a 0 is assigned if the respondent failed to draw the symbol. Respondents under the age of 60 at the time of the interview are not asked this question and are assigned special missing (.a). Baseline respondents are also not asked this question and are assigned special missing (.b). If the respondent is unable to do the drawing due to physical reasons, such as trembling hands or poor eyesight, the special missing (.s) is assigned. Don't know, refused, or other missing responses of **rWdrawinf** are assigned special missing codes (.d), (.r), or (.m), respectively. **rWdrawinf** is set to special missing (.p) if the cognition questions were skipped because the interview was by proxy. **rWdrawinf** is set to plain missing (.) for respondents who did not respond to this wave.

sWdrawinf indicates whether the current wave's spouse was able to draw the assigned symbol correctly, and is taken directly from the spouse's value to **rWdrawinf**. In addition to the special missing codes used in **rWdrawinf**, **sWdrawinf** employs two other missing codes: (.u) and (.v). The special missing value (.u) is used when the respondent does not report being coupled in the current wave. The special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWdrawcube indicates whether the respondent was able to draw a cube. A 1 is assigned if the respondent drew the cube partially correctly, with the cube having a general cube shape but fewer than 12 lines, a 2 is assigned if the respondent drew the cube fully correctly, with the cube having 12 lines, while a 0 is assigned if the respondent failed to draw the cube. Respondents under the age of 60 at the time of the interview are not asked this question and are assigned special missing (.a). Baseline respondents are also not asked this question and are assigned special missing (.b). If the respondent is unable to do the drawing due to physical reasons, such as trembling hands or poor eyesight, the special missing (.s) is assigned. Don't know, refused, or other missing responses of **rWdrawcube** are assigned special missing codes (.d), (.r), or (.m), respectively. **rWdrawcube** is set to special missing (.p) if the cognition questions were skipped because the interview was by proxy. **rWdrawcube** is set to plain missing (.) for respondents who did not respond to this wave.

sWdrawcube indicates whether the current wave's spouse was able to draw the cube correctly, and is taken directly from the spouse's value to **rWdrawcube**. In addition to the special missing codes used in **rWdrawcube**, **sWdrawcube** employs two other missing codes: (.u) and (.v). The special missing value (.u) is used when the respondent does not report being coupled in the current wave. The special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWdrawcl indicates whether the respondent successfully drew a clock showing the time of ten past five. Respondents were scored on three aspects of their drawing: whether the contour, numbers, and hands were correct. A value of 0 was assigned if both the number of numbers and the contour were incorrect. A value of 1 was assigned when either the number of numbers or the contour were correct. A value of 2 was assigned if the clock face (both the numbers around the edge and the contour) was correct or either the number of numbers or the contour and the clock hands were correct. A value of 3 was assigned if the clock face and the clock hands were correct. Respondents under the age of 60 at the time of the interview are not asked this question and are assigned special missing (.a). Baseline respondents are also not asked this question and are assigned special missing (.b). If the respondent is unable to do the drawing due to physical reasons, such as trembling hands or poor eyesight, the special missing (.s) is assigned. Don't know, refused, or other missing responses of **rWdrawcl** are assigned special missing codes (.d), (.r), or (.m), respectively. **rWdrawcl** is set to special missing (.p) if the cognition questions were

skipped because the interview was by proxy. **rWdrawc1** is set to plain missing (.) for respondents who did not respond to this wave.

sWdrawc1 indicates whether the current wave's spouse was able to draw a clock showing the time of ten past five correctly, and is taken directly from the spouse's value to **rWdrawc1**. In addition to the special missing codes used in **rWdrawc1**, **sWdrawc1** employs two other missing codes: (.u) and (.v). The special missing value (.u) is used when the respondent does not report being coupled in the current wave. The special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

These questions are asked starting in SHARE Wave 8.

Proxy Cognition: Rating of Respondent Memory

Variable	Waves	Label	Type
rWprmem	8-9	rWprmem:WW r memory rated by proxy	Categ
sWprmem	8-9	sWprmem:WW s memory rated by proxy	Categ
rWprchmem	8-9	rWprchmem:WW r memory compared to 2 years ago by proxy	Categ
sWprchmem	8-9	sWprchmem:WW s memory compared to 2 years ago by proxy	Categ

How Constructed

rWprmem provides a proxy-reported rating of the respondent's memory at the time of their interview. **rWprmem** is coded as follows: 1.excellent, 2.very good, 3.good, 4.fair, 5.poor. Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. **rWprmem** is assigned special missing (.p) if the respondent did not have a proxy. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWprmem provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWprmem**. In addition to the special missing codes used in **rWprmem**, **sWprmem** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWprchmem provides a proxy-reported rating of the respondent's memory compared to the time of their last interview. **rWprchmem** is coded as follows: 1.better, 2.same, 3.worse. Don't know, refuse, and other missing responses are set to special missing (.d), (.r), and (.m), respectively. **rWprchmem** is assigned special missing (.p) if the respondent did not have a proxy. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWprchmem provides the information for the respondent's spouse or partner and is taken directly from the respondent's spouse's values to **rWprchmem**. In addition to the special missing codes used in **rWprchmem**, **sWprchmem** employs the special missing value (.u), when the respondent does not report being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Proxy respondents were asked to rate the respondent's memory and change of memory starting in Wave 8.

Cross-Study Differences with the HRS

No differences known.

sWhaluc	8-9	sWhaluc:ww s hallucinates	Categ

How Constructed

rWlost, **rWwander**, **rWalone**, and **rWhaluc** indicate whether the proxy indicated that the respondent shows the following signs of cognitive impairment. **rWlost** indicates whether the respondent has ever gotten lost in a familiar environment. **rWwander** indicates whether the respondent ever wanders off and is not able to return by themselves. **rWalone** indicates whether the respondent can be left alone for an hour or so. **rWhaluc** indicates whether the respondent ever sees or hears things that are not really there. These variables are coded as 0.no and 1.yes. They are set to special missing value (.p) for non-proxy interviews. Don't know, refused, or other missing responses are assigned special missing values (.d), (.r), or (.m), respectively. **rWlost**, **rWwander**, **rWalone**, and **rWhaluc** are set to plain missing (.) if the respondent did not participate in the current wave.

sWlost, **sWwander**, **sWalone**, and **sWhaluc** are taken from the Wave 'w' spouse's values for **rWlost**, **rWwander**, **rWalone**, and **rWhaluc**, respectively. In addition to the special missing codes used in the respondent variables, if the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. Also, if the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

Cross Wave Differences in SHARE

These questions were asked starting in Wave 8.

Cross-Study Differences with the HRS

The RAND HRS has comparable variables for **rWlost**, **rWwander**, **rWalone**, and **rWhaluc**.

How Constructed

The following variables pertain to a series of questions that asked the proxy whether the respondent has improved, stayed the same, or gotten worse in various situations that require memory or intelligence. The interviewer emphasized the importance of comparing present performance with past performance and asked the proxy to compare the respondent's current ability with the respondent's ability 2 years ago or the date of last interview.

In **rWciqscore1s**, the proxy compared the respondent's current ability to remember things about family and friends, like occupations, birthdays, and addresses, with their ability two years ago.

In **rWciqscore2s**, the proxy compared the respondent's current ability to remember things that have happened recently with their ability two years ago.

In **rWciqscore3s**, the proxy compared the respondent's current ability to recall conversations a few days later with their ability two years ago.

In **rWciqscore5s**, the proxy compared the respondent's current ability to remember what day and month it is with their ability two years ago.

In **rWciqscore10s**, the proxy compared the respondent's current ability to learn new things in general with their ability two years ago.

In **rWciqscore13s**, the proxy compared the respondent's current ability to handle money for shopping with their ability two years ago.

In **rWciqscore14s**, the proxy compared the respondent's current ability to handle financial matters with their ability two years ago. Examples include pension-related decisions or dealing with the bank.

rWciqscore#s are coded as follows: 1.better, 2.same, and 3.worse. Special missing code (.p) is assigned to non-proxy interviews. Not applicable responses are coded as special missing code (.n). Don't know, refused, or other missing responses are assigned as special missing (.d), (.r), and (.m), respectively. These variables are set to plain missing (.) if the respondent did not participate in the current wave.

sWciqscore#s indicate the current wave's spouse's responses to **rWciqscore#s** and are coded as follows: 1.better, 2.same, and 3.worse. In addition to the special missing codes used in **rWciqscore#s**, **sWciqscore#s** employ two other

missing codes: (.u) and (.v). The special missing value (.u) is used when the respondent does not report being coupled in the current wave. The special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

These questions are asked starting in SHARE Wave 8.

Cross-Study Differences with the HRS

While the HRS asks all the JORM IQCODE questions, the SHARE asks only 7 of the JORM IQCODE questions using a simplified scale. Thus, "s" is added to the end of the variable name to show they aren't immediately comparable to the Harmonized HRS variables.

Cognition Testing Conditions

Variable	Waves	Label	Type
rWcogimp	1-2, 4-9	rWcogimp:WW r whether factors impaired cognition tests	Categ
sWcogimp	1-2, 4-9	sWcogimp:WW s whether factors impaired cognition tests	Categ
rWcogothp	1-2, 4-9	rWcogothp:WW r whether other people present during cog tests	Categ
sWcogothp	1-2, 4-9	sWcogothp:WW s whether other people present during cog tests	Categ

How Constructed

Cognition testing can be affected by the conditions of the test. SHARE provides two indicators of possible negative conditions during the cognition testing.

rWcogimp indicates whether the interviewer reported that any factors impaired the respondent's performance during the cognition tests. A code of 1 indicates that the interviewer reported that some factor impaired the respondent's performance during the cognition tests. A code of 0 indicates that the interviewer reported that no factors impaired the respondent's performance during the cognition tests. Don't know, refused, or other missing responses of **rWcogimp** are assigned special missing codes (.d), (.r), (.m), respectively. **rWcogimp** is assigned special missing (.p) if the questions were skipped because the interview was completed partially or completely by proxy. **rWcogimp** is set to plain missing (.) for respondents who did not respond to the current wave.

sWcogimp indicates whether the interviewer reported that any factors impaired the respondent's current wave's spouse's performance during the cognition tests. The values are taken from the spouse's values to **rWcogimp**. In addition to the special missing codes used in **rWcogimp**, **sWcogimp** employs two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWcogothp indicates whether the interviewer reported that there were other people in the room during the respondent's cognition tests. SHARE instructs interviewers that the cognition tests should be performed in private, i.e. only the interviewer and the respondent should be in the room at the time of the tests. A code of 0 indicates that the interviewer reported that there was no one else in the room during the cognition tests. A code of 1 indicates that the interviewer reported that the partner, child(ren), or other(s) were in the room during the cognition tests. Don't know, refused, or other missing responses of **rWcogothp** are assigned special missing codes (.d), (.r), (.m), respectively. **rWcogothp** is assigned special missing (.p) if the questions were skipped because the interview was completed partially or completely by proxy. **rWcogothp** is set to plain missing (.) for respondents who did not respond to the current wave.

sWcogothp indicates whether the interviewer reported that there were other people in the room during the respondent's current wave's spouse's cognition tests. The values are taken from the spouse's values to **rWcogothp**. In addition to the special missing codes used in **rWcogothp**, **sWcogothp** employs two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

rWcogimp and **rWcogothp** are assigned special missing (.p) if the questions were skipped because the interview was completed partially or completely by proxy. Starting in Wave 7, **rWcogimp** and **rWcogothp** have values regardless of it being a proxy interview, the majority are assigned 0.no or don't know values.

In Wave 7 there are no values for **rWcogimp** and **rWcogothp** for the respondents who took the condensed version of the regular questionnaire.

Cross-Study Differences with the HRS

The RAND HRS does not currently include indicators of the testing conditions during the HRS cognition tests.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

cYYYYcpindex is the annual consumer price index for the year of the survey. **cYYYYcpindex** uses 2010 as its base year so the consumer price index for a survey conducted in 2010 would be 100. This consumer price index can be used as an inflation multiplier when comparing financial values between different survey years.

cYYYYcpindex values were provided by the World Bank as part of the World Development Indicators (WDI) dataset. The index measures monthly changes in the general level of prices of goods and services that households acquire for consumption. For more information on the calculation of the consumer price index see <http://databank.worldbank.org>.

Cross Wave Differences in SHARE

Consumer price index values are not based on any SHARE survey questions.

Cross-Study Differences with the HRS

Consumer price index values are not included in the RAND HRS.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

The housing (HO) module is answered by the household respondent on behalf of the household. Given this, couple-level values can only be derived for couples without any additional household members participating in the survey. On the other hand, household-level values can be derived for all respondents. The HO module elicits the value of other real estate besides the primary residence in two steps. First it asks the respondent whether the household owns any secondary homes, holiday homes, other real estate, land or forestry, excluding time-sharing arrangement and own business. If the answer to this question is yes, the respondent is then asked how much, in their own opinion, the property/properties would be worth if sold now.

hWarles is the value of other real estate at the couple-level economic unit (the respondent and spouse, if any). **hWarles** is based on SHARE derived variables which include imputations for missing values. If the household included additional survey participants beyond the respondent and their spouse/partner at the time of the interview, then **hWarles** is assigned special missing (.e). Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and **hWarles** is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWafroles** is the imputation flag indicating whether the value of **hWarles** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having the asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the household respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWarles is the value of other real estate at the household-level (all respondents in the household). **hhWarles** is based on SHARE derived variables which include imputations for missing values. Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and **hhWarles** is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hhWafroles** is the imputation flag indicating whether the value of **hhWarles** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed

without any bracket information. A code of 6 indicates that the respondent reported not having the asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the household respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

The question wording changed slightly between Waves 1 and 2 and Wave 4 and onward. In Wave 1 and Wave 2 the survey asked, "Not including special time-sharing arrangements, do you own secondary homes, holiday homes, other real estate, land or forestry?" Starting in Wave 4, the survey asked, "Do you own secondary homes, holiday homes, other real estate, land or forestry? Please do not include: time-sharing arrangement, own business."

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire, they were not asked this question. For those respondents who were asked this question in Wave 7, SHARE did not include unfolding bracket questions if the respondent was not able to provide a value. For all other waves, SHARE included unfolding bracket questions if the respondent was not able to provide a value.

Cross-Study Differences with the HRS

The RAND HRS variable for Other Real Estate does not include the value of any secondary residence. In the HRS, this is asked separately and recorded in a different variable. Also, while the HRS variable records the value of other real estate net of any debt, the SHARE variable measures its gross value.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

The asset (AS) module is answered by the financial respondent on behalf of themselves and their spouse/partner, if any. Imputed asset values are provided at the couple-level, therefore household-level values can be derived for all respondents.

The AS module elicits the value of cars by asking the respondent how many cars they own, excluding company cars, and how much would be left if they sold them. Hence, the question asks respondents to provide the value of the cars net of depreciation and pending debt.

hWatran is the net value of vehicles at the couple-level economic unit (the respondent and spouse, if any). **hWatran** is based on SHARE derived variables which include imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWaftran** is the imputation flag indicating whether the value of **hWatran** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having the asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -4 indicates that the financial respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Missing flag values are set to special missing value (.m). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWatran is the net value of vehicles at the household-level (all respondents in the household). **hhWatran** is based on SHARE derived variables which include imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hhWaftran** is the imputation flag indicating whether the value of **hhWatran** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having the asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -4 indicates that the financial respondent of the household did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In Wave 1, couples were asked whether they kept finances together or separate. If they kept finances separate, both individuals reported their own assets. If they kept finances together, the one most knowledgeable about the couple's finances was selected as the financial respondent and answered the AS module on behalf of the couple. From Wave 2 onward, couples are not given the option to report separately and a financial respondent always answers the AS module on behalf of the couple.

The question wording changed slightly between Wave 1, Wave 2, and Wave 4. In Wave 1, the survey asked, "If you sold [this/these] [car/cars] and paid off any debts that you may have on [it/them], about how much would be left?" In Wave 2, the survey asked, "If you sold [this/these] [car/cars] about how much would be left?" Starting in Wave 4 the survey asked, "If you sold [this/these] [car/cars] about how much would you get?"

In Wave 7, if the financial respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire, they were not asked this question.

Cross-Study Differences with the HRS

The corresponding variable in the RAND HRS includes the net value of cars as well as the value of vehicles other than cars (e.g., motorcycles, boats, airplanes).

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

The asset (AS) module is answered by the financial respondent on behalf of themselves and their spouse/partner, if any. Imputed asset values are provided at the couple-level, therefore household-level values can be derived for all respondents.

The AS module elicits the net value of businesses by asking the respondent whether they currently own a firm, company, or business and how much would be left if the properties were sold and any outstanding debts paid off. The respondent is also asked what percentage or share of the business they own.

hWabsns is the net value of businesses at the couple-level economic unit (the respondent and spouse, if any). **hWabsns** is based on a SHARE derived variable which is the value of the share of business they own and includes imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWafbsns** is the imputation flag indicating whether the value of **hWabsns** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having the asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -4 indicates that the financial respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Missing flag values are set to special missing value (.m). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWabsns is the net value of businesses at the household-level (all respondents in the household). **hhWabsns** is based on a SHARE derived variable which is the value of the share of business they own and includes imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hhWafbsns** is the imputation flag indicating whether the value of **hhWabsns** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -4 indicates that the financial respondent of the household did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In Wave 1, couples were asked whether they kept finances together or separate. If they kept finances separate, both individuals reported their own assets. If they kept finances together, the one most knowledgeable about the couple's finances was selected as the financial respondent and answered the AS module on behalf of the couple. From Wave 2 onward, couples are not given the option to report separately and a financial respondent always answers the AS module on behalf of the couple.

The question wording changed slightly between Wave 1 and Wave 2. In Wave 1, the survey asked, "Do you own a firm, company, or business? If you sold this firm, company or business and then paid off any debts on it, about how much money would be left?" Starting in Wave 2, the survey asked, "Do you currently own a firm, company, or business? If you sold this firm, company or business and then paid off any debts on it, about how much money would be left?"

Starting in Wave 6, the wording of the question was changed to ask how much money would be left for the respondent or their husband/wife/partner?

In Wave 7, if the financial respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire, they were not asked this question.

Cross-Study Differences with the HRS

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

The asset (AS) module is answered by the financial respondent on behalf of themselves and their spouse/partner, if any. Imputed asset values are provided at the couple-level, therefore household-level values can be derived for all respondents.

The value of IRA and other long-term savings is a summary value based on three different components: the value of individual retirement accounts, the value of contractual savings for housing, and the value of whole life insurance policy holdings. The AS module elicits the value of Individual Retirement Accounts (IRAs) held personally by the respondent and their spouse. The financial respondent answers separately about the value of their own account and the one of their spouse. The AS section elicits the value of contractual savings for housing by first asking the respondent whether they have contractual savings for housing and, if the answer is yes, how much money they have in contractual savings. The AS module elicits the value of whole life insurance policy holdings by asking the respondent whether they have any life insurance policies and, if yes, whether their policies are term policies, whole life policies, or both. If the respondent reports having a whole life insurance policy, then the face value of such policy is elicited too.

hWairothr is the net value of IRA and other long-term savings at the couple-level economic unit (the respondent and spouse, if any). **hWairothr** is based on SHARE derived variables which include imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWafirothr** is the imputation flag indicating whether the value of **hWairothr** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -4 indicates that the financial respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Missing flag values are assigned special missing value (.m). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWairothr is the net value of IRA and other long-term savings at the household-level (all respondents in the household). **hhWairothr** is based on SHARE derived variables which include imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hhWafirothr** is the imputation flag indicating whether the value of **hhWairothr** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -4 indicates that the financial

respondent(s) of the household did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In Wave 1, couples were asked whether they kept finances together or separate. If they kept finances separate, both individuals reported their own assets. If they kept finances together, the one most knowledgeable about the couple's finances was selected as the financial respondent and answered the AS module on behalf of the couple. From Wave 2 onward, couples are not given the option to report separately and a financial respondent always answers the AS module on behalf of the couple.

The asset question wording changed slightly between Wave 1, Wave 2, and Wave 4. In Wave 1, ownership of most financial assets was asked in one "check all that apply" question using a show card. The show card read: "Looking at this card, which, if any, of these savings and investments do you have? 1. Bank accounts, transaction accounts or saving accounts, 2. Government or corporate bonds, 3. Stocks or shares (listed or unlisted on stock market), 4. Mutual funds or managed investment accounts, 5. Individual retirements accounts, 6. Contractual saving for housing, 7. Life insurance, 96. None of these". In Wave 2 and forward, ownership of IRAs was asked through a separate question: "Do you currently have any money in individual retirements accounts?" Wave 2 also included an interviewer note, "An individual retirement account is a retirement account that lets the person put some money away each year, to be (partially) taken out at retirement time", whereas since Wave 4, this explanation was included as part of the question, not as a separate interviewer note. In Wave 2 and forward, ownership of contractual savings was asked through a separate question: "Do you currently have any money in contractual saving for housing?" Wave 2 also included an interviewer note: "Contractual savings for housing: An account at a financial institution that accumulates cash to be used towards the purchase of a house", whereas since Wave 4, this explanation was included as part of the question, not as a separate interviewer note. In Wave 1, if the respondent reported they had life insurance from the check all that apply list, then they were asked, "Are your life insurance policies term policies, whole life insurance policies, or both of these." In Wave 2 and forward, ownership of whole life insurance was asked through a separate question: "Do you currently own any life insurance policies?" If the respondent answered yes, they were asked the question: "Are your life insurance policies term policies, whole life policies, or both of these?" Wave 2 also included an interviewer note: "Term life insurance provides coverage for a fixed period of time and pays a predetermined amount only if the policyholder dies within this period. On the other hand, whole life insurance has a savings component that increases in value over time and can be paid back in many installments over time or all at once". Since Wave 4, this explanation was included as part of the question, not as a separate interviewer note.

In Wave 1, respondents were first asked whether they owned financial assets at the time of the interview and then to report the value of such assets as of the end of the previous year (e.g. the value of the asset at the end of 2003 if the interview took place in 2004). Since Wave 2, respondents were asked to report both ownership and value as of the time of the interview. In Wave 1, the amount question starts with "Apart from anything you have already told me". In Wave 2 and forward, this phrase has been dropped.

IRAs are absent in Austria and the Netherlands, and thus the values are always 0 for respondents residing in these countries. It should be noted that Austria has an additional category "private pension precautions", which is similar to IRAs. However, while the survey asks about ownership of this asset, the corresponding value is not elicited. In France, the IRA category was combined with "Life insurance in case of survival", i.e. annuities paid as long as the beneficiary remains alive.

Contractual savings are not asked about in Belgium and Israel, and thus the values are always zero in these countries.

In Wave 7, if the financial respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire, they were not asked this question.

Cross-Study Differences with the HRS

This variable is a summary variable which is specific to SHARE and is not available in the RAND HRS. HRS respondents are asked to exclude the cash value of any life insurance policies when reporting the value of their financial assets.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

The asset (AS) section is answered by the financial respondent on behalf of themselves and their spouse/partner, if any. Imputed asset values are provided at the couple-level, therefore household-level values can be derived for all respondents.

The AS module elicits the value of bank accounts by asking the respondent whether they have a bank account, transaction account, savings account, or postal account. If the respondent answers yes, then they are asked how much they have in such accounts.

hWachck is the value of bank accounts at the couple-level economic unit (the respondent and spouse, if any). **hWachck** is based on SHARE derived variables which included imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWafchck** is the imputation flag indicating whether the value of **hWachck** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates the value was imputed based on a complete bracket. A code of 3 indicates the value was imputed based on an incomplete bracket. A code of 5 indicates the value was imputed without any bracket information. A code of 6 indicates the respondent reported not having this asset and the value is 0. A code of 7 indicates it was unknown whether the respondent has this asset so both ownership and the subsequent value were imputed. A code of -4 indicates that the financial respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Missing flag values are assigned special missing value (.m). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWachck is the value of bank accounts defined at the full household-level (all respondents in the household). **hhWachck** is based on SHARE derived variables which included imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hhWafchck** is the imputation flag indicating whether the value of **hhWachck** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates the value was imputed based on a complete bracket. A code of 3 indicates the value was imputed based on an incomplete bracket. A code of 5 indicates the value was imputed without any bracket information. A code of 6 indicates the respondent reported not having this asset and the value is 0. A code of 7 indicates it was unknown whether the respondent has this asset so both ownership and the subsequent value were imputed. A code of -4 indicates that the financial(s) respondent of the household did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In Wave 1, couples were asked whether they kept finances together or separate. If they kept finances separate, both individuals reported their own assets. If they kept finances together, the one most knowledgeable about the couple's finances was selected as the financial respondent and this individual reported the joint assets of the couple. In Wave 2 and forward, couples were not given the option to report separately and a financial respondent was always chosen.

The question wording changed slightly between Wave 1 and Wave 2. In Wave 1, ownership of most wealth components was asked in one "check all that apply" question using a show card. The show card read: "Looking at this card, which, if any, of these savings and investments do you have? 1. Bank accounts, transaction accounts or saving accounts, 2. Government or corporate bonds, 3. Stocks or shares (listed or unlisted on stock market), 4. Mutual funds or managed investment accounts, 5. Individual retirements accounts, 6. Contractual saving for housing, 7. Life insurance, 96. None of these". In Wave 2 and forward, ownership of these components was asked through separate questions: "currently have any money in bank accounts, transaction accounts, saving accounts or postal accounts?" As is clear, the wording changed slightly: in Wave 1, respondents were asked whether they had a bank account, not whether they had any money in it, whereas in Wave 2 and forward, they were asked whether they had any money in a bank account. Furthermore, in Wave 2 and forward, "postal account" was added.

In Wave 1, the value of the assets at the end of the previous year was asked, so for an interview in 2004, the value at the end of 2003 was asked. However, the "check all that apply" question above seems to ask for current ownership. In Wave 2 and forward, both ownership and value were asked for the current date.

In Wave 7, if the financial respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire, they were not asked this question.

Cross-Study Differences with the HRS

SHARE uses the label "bank accounts, transaction accounts, saving accounts or postal accounts", while the HRS label is "checking or savings accounts or money market funds". Note that SHARE also elicits the value of contractual savings for housing. This saving instrument is included in "IRAs and other long-term savings" (**hWairothr**).

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

The asset (AS) module is answered by the financial respondent on behalf of themselves and their spouse/partner, if any. Imputed asset values are provided at the couple-level, therefore household-level values can be derived for all respondents.

The AS module elicits the value of bonds by asking the respondent whether they have government or corporate bonds. If the respondent answers yes, they are then asked how much money they have in those bonds. The AS module elicits the value of stocks by asking the respondent whether they have stocks or shares. If the respondent answers yes, they are then asked how much money they have in those stocks and shares. The AS module elicits the value of mutual funds by asking the respondent whether they have mutual funds or managed investment accounts. If the respondent answers yes, they are then asked how much money they have in those funds.

hWabdstk is the net value of bonds, stocks, and mutual funds at the couple-level economic unit (the respondent and spouse, if any). **hWabdstk** is based on SHARE derived variables which include imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWafbdstk** is the imputation flag indicating whether the value of **hWabdstk** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having the asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -4 indicates that the financial respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Missing flag values are assigned special missing value (.m). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWabdstk is the net value of bonds, stocks, and mutual funds at the household-level (all respondents in the household). **hhWabdstk** is based on SHARE derived variables which include imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hhWafbdstk** is the imputation flag indicating whether the value of **hhWabdstk** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having the asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -4 indicates that the financial respondent(s) of the household did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In Wave 1, couples were asked whether they kept finances together or separate. If they kept finances separate, both individuals reported their own assets. If they kept finances together, the one most knowledgeable about the couple's finances was selected as the financial respondent and answered the AS module on behalf of the couple. From Wave 2 onward, couples are not given the option to report separately and a financial respondent always answers the AS module on behalf of the couple.

The asset question wording changed slightly between Wave 1, Wave 2, and Wave 4. In Wave 1, ownership of most wealth components was asked in one "check all that apply" question using a show card. The show card read: "Looking at this card, which, if any, of these savings and investments do you have? 1. Bank accounts, transaction accounts or saving accounts, 2. Government or corporate bonds, 3. Stocks or shares (listed or unlisted on stock market), 4. Mutual funds or managed investment accounts, 5. Individual retirements accounts, 6. Contractual saving for housing, 7. Life insurance, 96. None of these". From Wave 2 onward, ownership of bonds was asked through a separate question: "Do you currently have any money in government or corporate bonds?" Wave 2 also included an interviewer note: "Bonds are a debt instrument issued by the government or a corporation in order to generate capital by borrowing", whereas since Wave 4, this explanation was included as part of the question, not as a separate interviewer note. From Wave 2 onward, ownership of stocks was asked through a separate question: "Do you currently have any money in stocks or shares (listed or unlisted on stock market)?" and "Do you currently have any money in mutual funds or managed investment accounts?" Wave 2 also included an interviewer note: "Stocks are pieces of paper that show that the person owns part of a corporation and has the right to receive dividends from it", whereas since Wave 4, this explanation was included as part of the question, not as a separate interviewer note. From Wave 2 onward, ownership of mutual funds was asked through a separate question: "Do you currently have any money in mutual funds or managed investment accounts?" Wave 2 also included an interviewer note: "Mutual funds are a pool of money belonging to many investors who trust a manager to invest it in stocks and/or bonds", whereas since Wave 4, this explanation was included as part of the question, not as a separate interviewer note.

In Wave 1, the value of the assets at the end of the previous year was asked, so for an interview in 2004, the value at the end of 2003 was asked. However, the "check all that apply" question above seems to ask for current ownership. In Wave 2, both ownership and value were asked for the current date. In Wave 1, the amount question starts with: "Apart from anything you have already told me". From Wave 2 onward, this phrase has been dropped.

In Wave 7, if the financial respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire, they were not asked this question.

Cross-Study Differences with the HRS

This variable is a summary variable which is specific to SHARE and is not available in the RAND HRS.

The HRS questionnaire features separate items for bonds and Treasury Bills. Specifically, one question asks about the value of corporate, municipal, government, and foreign bonds, as well as bond funds. A second question asks about the value of CDs, Government Savings Bonds, and Treasury Bills. The SHARE question is less detailed and includes in one category government and corporate bonds.

SHARE uses the phrase "managed investment accounts", which the HRS does not mention. SHARE asks separate questions about stocks and mutual funds, whereas these are included in a single asset category in the HRS.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

The asset (AS) module is answered by the financial respondent on behalf of themselves and their spouse/partner, if any. Imputed asset values are provided at the couple-level, therefore household-level values can be derived for all respondents.

The AS module elicits the value of debt by asking the respondent to identify the types of debt they have from a list, including debt on cars and other vehicles, debt on credit and store cards, loans from financial institutions, debts to relatives and friends, student loans, and overdue bills. Respondents are explicitly requested to exclude mortgages and money owed on land, property or firms. If the respondent reports having any of these debts, then they are asked how much they owe in total.

hWadebt is the value of debt at the couple-level economic unit (the respondent and spouse, if any). **hWadebt** is based on SHARE derived variables which include imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWafdebt** is the imputation flag indicating whether the value of **hWadebt** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having the asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -4 indicates that the financial respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Missing flag values are set to special missing value (.m). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWadebt is the value of debt at the household-level (all respondents in the household). **hhWadebt** is based on SHARE derived variables which include imputations for missing values. Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hhWafdebt** is the imputation flag indicating whether the value of **hhWadebt** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having the asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -4 indicates that the household respondent(s) did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In Wave 1, couples were asked whether they kept finances together or separate. If they kept finances separate, both individuals reported their own assets. If they kept finances together, the one most knowledgeable about the couple's finances was selected as the financial respondent and answered the AS module on behalf of the couple. From Wave 2 onward, couples are not given the option to report separately and a financial respondent always answers the AS module on behalf of the couple.

The question wording changed slightly between Wave 1, Wave 2, and Wave 4. In Wave 1, the respondents were given the introduction text: "The next questions refer to money that you may owe. Do not include mortgages or money owed on land, property or firms." Debt categories were then asked in one "check all that apply" question using a show card. The show card read: "Which of these types of debts do you currently have, if any? 1. Debt on cars and other vehicles (vans/motorcycles/boats, etc.), 2. Overdue bills (phone, electricity, heating), 3. Overdue credit cards / store card bills, 4. Loans (from bank, building society or other financial institution), 5. Debts to relatives or friends, 6. Student loans, 96. None of these". In Wave 2, the survey used the same introduction text but the show card differed slightly. The show card read: "which of these types of debts do you currently have, if any? 1. Debt on cars and other vehicles (vans/motorcycles/boats, etc.), 2. Debt on credit cards / store cards, 3. Loans (from bank, building society or other financial institution), 4. Debts to relatives or friends, 5. Student loans, 6. Overdue bills (phone, electricity, heating, rent), 96. None of these, 97. Other". Starting in Wave 4, respondents were given the introduction text: "The next question refers to money that you may owe, excluding mortgages (if any)." Debt categories were then asked in one "check all that apply" question using a show card. The show card read: "which of these types of debts do you currently have, if any? 1. Debt on cars and other vehicles (vans/motorcycles/boats, etc.), 2. Debt on credit cards / store cards, 3. Loans (from bank, building society or other financial institution), 4. Debts to relatives or friends, 5. Student loans, 6. Overdue bills (phone, electricity, heating, rent), 96. None of these, 97. Other". As is clear, the wording of the introduction text changed after Waves 1 and 2 and no longer explicitly excluded "money owed on land, property or firms". Furthermore, the order or phrasing of the debt categories on the show card changed after Wave 1.

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire, they were not asked this question.

Cross-Study Differences with the HRS

The SHARE variable explicitly includes car debts. It should be noted that car debts may be implicitly reported in the "net value of cars" (**hWatran**) even though the questionnaire does not explicitly instruct the respondent to report car values net of outstanding debts. The HRS questionnaire specifically mentions "any debts that we haven't asked about." Since respondents are explicitly instructed to report the value of vehicles net of any outstanding debts, the variable recording other debts in the RAND HRS does not include car debts/loans.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

hWatotf is the net value of non-housing financial wealth at the couple-level economic unit (the respondent and spouse, if any). The net value of non-housing financial wealth is calculated as the sum of savings/checking and bond/stock wealth minus debt:

$$\mathbf{hWatotf} = (\mathbf{hWachck} + \mathbf{hWabdstk}) - \mathbf{hWadebt}$$

Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question.

hWaftotf is the imputation flag indicating whether any of the components of **hWatotf** were imputed or not. A code of 1 indicates that the respondent only reported continuous values and no imputation was necessary. A code of 2 indicates that at least one value was imputed based on a complete bracket. A code of 3 indicates that at least one value was imputed based on an incomplete bracket. A code of 5 indicates that at least one value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having at least one of the assets and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed for at least one component. A code of -4 indicates that the financial respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Missing flag values are assigned special missing value (.m). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWatotf is the net value of non-housing financial wealth at the household-level (all respondents in the household). The net value of non-housing financial wealth is calculated as the sum of the appropriate wealth components minus debt:

$$\mathbf{hhWatotf} = (\mathbf{hhWachck} + \mathbf{hhWabdstk}) - \mathbf{hhWadebt}$$

Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question.

hhWaftotf is the imputation flag indicating whether any of the components of **hhWatotf** were imputed or not. A code of 1 indicates that the respondent only reported continuous values and no imputation was necessary. A code of 2 indicates that at least one value was imputed based on a complete bracket. A code of 3 indicates that at least one value was imputed based on an incomplete bracket. A code of 5 indicates that at least one value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having at least one of the assets and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed for at least one component. A code of -4 indicates that the financial respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort

and did not complete the regular SHARE Wave 7 questionnaire. Missing flag values are assigned special missing value (.m). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Note: This total does NOT include the value of IRAs, nor does it include the value of any real estate, vehicles, or businesses.

Cross Wave Differences in SHARE

Since Wave 4, the imputed value of contractual savings for housing is not provided by itself but is instead included in the imputed value of savings for long term investment alongside with individual retirement accounts and whole life insurance holdings. Thus, it is not possible to construct the net value of non-housing financial wealth in the same way since Wave 4 since it would have to necessarily include the value of IRAs (as well as whole life insurance holdings).

For other differences, see the single components of **hWatotf**.

Cross-Study Differences with the HRS

The RAND HRS variable also includes the variable **hwacd**, measuring the value of certificates of deposit (CDs), government savings bonds, and treasury bills (T-bills). The value of these financial assets is not separately elicited by SHARE. For other differences, see the single components of **hWatotf**.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

Home Ownership

Variable	Waves	Label	Type
rWhownrnt	1-2, 4-9	rWhownrnt: wW r whether owns or rents home	Categ

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

rWhownrnt indicates whether the respondent reports owning or renting their home. A value of 1 indicates that the respondent reports owning a home, including ownership through membership in a cooperative. A value of 2 indicates that the respondent reports renting a home, including rent through a sublease agreement. A value of 3 indicates that the respondent reports other living arrangements, such as residing in a home rent free or as beneficiaries of an usufruct agreement (only in France). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. Starting in Wave 2, longitudinal respondents who report no change in residence since the previous wave are not asked this question in the current wave, and the value from the previous wave is carried forward. Don't know, refuse, and other missing responses are set to special missing values (.d), (.r), and (.m), respectively. **rWhownrnt** is assigned plain missing (.) if the respondent did not participate in the current wave.

The housing (HO) module is generally answered by the household respondent on behalf of the household. However, this question is asked only to the household respondent about themselves, not including their spouse. Therefore, the variable **sWhownrnt** is not available for this question. A special missing (.h) is assigned to **rWhownrnt** if the respondent is not designated as the household respondent and so is not asked this question.

Cross Wave Differences in SHARE

The question wording is slightly different across countries. The ownership/rent question does not include "member of a cooperative" in Austria, Germany, Spain, and the Netherlands. In France, the ownership question includes an additional category "Usufruitier total" ("full usufructuary"), which we code as other living arrangements.

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire, they were not asked this question.

Cross-Study Differences with the HRS

This variable is not currently available in the RAND HRS or Harmonized HRS. The RAND HRS Detailed Imputations Files includes **hWaoHous** indicating whether the couple owns their home in the current wave.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

The housing (HO) module is answered by the household respondent on behalf of the household. Given this, couple-level values can only be derived for couples without any additional household members participating in the survey. On the other hand, household-level values can be derived for all respondents.

The HO module elicits the value of the primary residence by asking the respondent whether they live as an owner, member of a cooperative, main tenant, subtenant, or living rent free. If the respondent answers they are the owner or member of the cooperative, then they are asked how much, in their own opinion, the property would be worth if sold now.

hWahous is the value of the primary residence at the couple-level economic unit (the respondent and spouse, if any). **hWahous** is based on SHARE derived variables which include imputations for missing values. **hWahous** is set to special missing value (.e) if the household included additional survey participants beyond the respondent and their spouse/partner at the time of the interview. Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and **hWahous** is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWafhous** is the imputation flag indicating whether the value of **hWahous** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the household respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWahous is the value of the primary residence at the household-level (all respondents in the household). **hhWahous** is based on SHARE derived variables which include imputations for missing values. Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and **hhWahous** is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hhWafhous** is the imputation flag indicating whether the value of **hhWahous** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed

without any bracket information. A code of 6 indicates that the respondent reported not having this asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the household respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

The question wording is slightly different across countries. The ownership question does not include “member of a cooperative” in Austria, Germany, Spain, and the Netherlands. In France, the ownership question includes an additional category “Usufruitier total” (“full usufructuary”).

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire, they were not asked this question. For those respondents who were asked this question in Wave 7, SHARE did not include unfolding bracket questions if the respondent was not able to provide a value. For all other waves, SHARE included unfolding bracket questions if the respondent was not able to provide a value.

Cross-Study Differences with the HRS

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

The housing (HO) module is answered by the household respondent on behalf of the household. Given this, couple-level values can only be derived for couples without any additional household members participating in the survey. On the other hand, household-level values can be derived for all respondents. The HO module asks the respondent whether they live as an owner, member of a cooperative main tenant, subtenant, or living rent free. If the respondent answers they are the owner or member of the cooperative, then they are asked if they have mortgages or loans on the property and, if they do, the amount they still owe excluding interest.

hWamort is the value of mortgages or loans on the primary residence at the couple-level economic unit (the respondent and spouse, if any). **hWamort** is based on SHARE derived variables which include imputations for missing values. **hWamort** is assigned special missing value (.e) if the household included additional survey participants beyond the respondent and their spouse/partner at the time of the interview. Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and hWamort is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWafmort** is the imputation flag indicating whether the value of **hWamort** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having the asset and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the household respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWamort is the value of mortgages or loans on the primary residence at the household-level (all respondents in the household). **hhWamort** is based on SHARE derived variables which include imputations for missing values. Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and hWamort is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hhWafmort** is the imputation flag indicating whether the value of **hhWamort** was imputed or not. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having the asset

and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the household respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

The question wording is slightly different between countries, the ownership question does not include “member of a cooperative” in Austria, Germany, Spain, and the Netherlands. In France, the ownership question includes an additional category “Usufruitier total” (“full usufructuary”).

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire, they were not asked this question. For those respondents who were asked this question in Wave 7, SHARE did not include unfolding bracket questions if the respondent was not able to provide a value. For all other waves, SHARE included unfolding bracket questions if the respondent was not able to provide a value.

Cross-Study Differences with the HRS

For the primary residence, the HRS asks separately about the first mortgage, the second mortgage, other home loans, and home equity lines of credit. In the RAND HRS, mortgages are included in **hWamort**, whereas other home loans and debt on home equity lines of credit are included in **hWahmln**. In contrast, SHARE only asks about the combined total value of all mortgages and other loans on the primary residence. Thus, the Gateway Harmonized SHARE variable **hWamort** measures the concept measured by the sum of **hWamort** and **hWahmln** in the RAND HRS.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

hWatoth is the net value of the primary residence at the couple-level economic unit (the respondent and spouse, if any). The net value of housing is calculated as house value minus mortgages and home loans:

$$\mathbf{hWatoth} = \mathbf{hWahous} - \mathbf{hWamort}$$

hWatoth is assigned special missing value (.e) if the household included additional survey participants beyond the respondent and their spouse/partner at the time of the interview. Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and **hWatoth** is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWaftoth** is the imputation flag indicating the highest level of imputation required in the calculation of **hWatoth**. A code of 1 indicates that the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that the value is constructed with imputed values based on a complete bracket. A code of 3 indicates that the value is constructed with imputed values based on an incomplete bracket. A code of 5 indicates that the value is constructed with imputed values without any bracket information. A code of 6 indicates that the respondent reported not having any of the included assets and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed for at least one of the component assets. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the household respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWatoth is the net value of the primary residence at the household-level (all respondents in the household). The net value of housing is calculated as house value minus mortgages and home loans:

$$\mathbf{hhWatoth} = \mathbf{hhWahous} - \mathbf{hhWamort}$$

Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and **hWatoth** is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question.

hhWaftoth is the imputation flag indicating the highest level of imputation required in the calculation of **hhWatoth**. A code of 1 indicates that the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that the value is constructed with imputed values based on a complete bracket. A code of 3 indicates that the value is constructed with imputed values based on an incomplete bracket. A code of 5 indicates that the value is

constructed with imputed values without any bracket information. A code of 6 indicates that the respondent reported not having any of the included assets and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed for at least one of the component assets. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the household respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

See components.

Cross-Study Differences with the HRS

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

hWatotb is the net value of total wealth at the couple-level economic unit (the respondent and spouse, if any). The net value of total wealth is calculated as the sum of all wealth components minus the value of all debts:

$$\mathbf{hWatotb} = (\mathbf{hWahous} + \mathbf{hWarles} + \mathbf{hWatran} + \mathbf{hWabsns} + \mathbf{hWairothr} + \mathbf{hWabdstk} + \mathbf{hWachck}) - (\mathbf{hWamort} + \mathbf{hWadebt})$$

hWatotb is set to special missing value (.e) if the household included additional survey participants beyond the respondent and their spouse/partner at the time of the interview. Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and **hWatotb** is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWaftotb** is the imputation flag indicating the highest level of imputation required in the calculation of **hWatotb**. A code of 1 indicates that the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that the value is constructed with imputed values based on a complete bracket. A code of 3 indicates that the value is constructed with imputed values based on an incomplete bracket. A code of 5 indicates that the value is constructed with imputed values without any bracket information. A code of 6 indicates that the respondent reported not having any of the included assets and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed for at least one of the component assets. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the financial/household respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWatotb is the net value of total wealth at the household-level (all respondents in the household). The net value of total wealth is calculated as the sum of all wealth components minus the value of all debts:

$$\mathbf{hhWatotb} = (\mathbf{hhWahous} + \mathbf{hhWarles} + \mathbf{hhWatran} + \mathbf{hhWabsns} + \mathbf{hhWairothr} + \mathbf{hhWabdstk} + \mathbf{hhWachck}) - (\mathbf{hhWamort} + \mathbf{hhWadebt})$$

Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and **hWatotb** is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question.

hhWaftotb is the imputation flag indicating the highest level of imputation required in the calculation of **hhWatotb**. A code of 1 indicates that the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that the value is constructed with imputed values based on a complete bracket. A code of 3 indicates that the

value is constructed with imputed values based on an incomplete bracket. A code of 5 indicates that the value is constructed with imputed values without any bracket information. A code of 6 indicates that the respondent reported not having any of the included assets and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed for at least one of the component assets. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the financial/household respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

See components.

Cross-Study Differences with the HRS

The RAND HRS variable also includes the variable **hwacd**, measuring the value of certificates of deposit (CDs), government savings bonds, and treasury bills (T-bills). The value of these financial assets is not separately elicited by SHARE. Furthermore, the RAND HRS variable also includes **hwahoub** and **hwamrtb** (value of the second home and its mortgage, respectively), which are included in **hwarles** in Gateway Harmonized SHARE. From Wave 4 onward, both total financial and housing wealth also include the value of whole life insurance. HRS respondents are explicitly asked to exclude the cash value of any life insurance policies when reporting the value of their assets. See the single components of **hwatotb** for other differences.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Asset measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All wealth measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When a wealth component is missing it is imputed. We refer to the section 'Missing Values, Nonresponse, and Imputations' earlier in this document for more details.

How Constructed

hWatotn is the total non-housing wealth at the couple-level economic unit (the respondent and spouse, if any). The net value of all non-housing wealth is calculated as the sum of the appropriate wealth components minus debt:

$$\mathbf{hWatotn} = (\mathbf{hWarles} + \mathbf{hWatran} + \mathbf{hWabsns} + \mathbf{hWairothr} + \mathbf{hWabdstk} + \mathbf{hWachck}) - \mathbf{hWdebt}$$

Note that the value of the primary residence, mortgages, and home loans are NOT included.

hWatotn is assigned special missing value (.e) if the household included additional survey participants beyond the respondent and their spouse/partner at the time of the interview. Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and **hWatotn** is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question. **hWaftotn** is the imputation flag indicating the highest level of imputation required in the calculation of **hWatotn**. A code of 1 indicates that the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that the value is constructed with imputed values based on a complete bracket. A code of 3 indicates that the value is constructed with imputed values based on an incomplete bracket. A code of 5 indicates that the value is constructed with imputed values without any bracket information. A code of 6 indicates that the respondent reported not having any of the included assets and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed for at least one of the component assets. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the financial respondent did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWatotn is the total non-housing wealth at the household-level (all respondents in the household). The net value of all non-housing wealth is calculated as the sum of the appropriate wealth components minus debt:

$$\mathbf{hhWatotn} = (\mathbf{hhWarles} + \mathbf{hhWatran} + \mathbf{hhWabsns} + \mathbf{hhWairothr} + \mathbf{hhWabdstk} + \mathbf{hhWachck}) - \mathbf{hhWdebt}$$

Note that the value of the primary residence, mortgages, and home loans are NOT included.

Starting in Wave 2, if the respondent was in an institution at the time of the interview, SHARE does not provide imputations and **hWatotn** is assigned special missing (.i). Special missing (.f) is assigned if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather took part in the SHARELIFE questionnaire and was hence not asked this question.

hhWafotn is the imputation flag indicating the highest level of imputation required in the calculation of **hhWatotn**. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the respondent reported continuous values for all components and no imputation was necessary. A code of 3 indicates that the value is constructed with imputed values based on a complete bracket. A code of 4 indicates that the value is constructed with imputed values based on an incomplete bracket. A code of 5 indicates that the value is constructed with imputed values without any bracket information. A code of 6 indicates that the respondent reported not having any of the included assets and, therefore, its value was set to 0. A code of 7 indicates that both asset ownership and asset value were imputed for at least one of the component assets. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). A code of -4 indicates that the financial(s) respondent of the household did not answer the question as they were part of the SHARELIFE Wave 7 cohort and did not complete the regular SHARE Wave 7 questionnaire. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

See components.

Cross-Study Differences with the HRS

The RAND HRS variable also includes the variable **hwacd**, measuring the value of certificates of deposit (CDs), government savings bonds, and treasury bills (T-bills). The value of these financial assets is not separately elicited by SHARE. Furthermore, the RAND HRS variable also includes **hwahoub** and **hwamrtb** (value of the second home and its mortgage, respectively), which are included in **hwarles** in Gateway Harmonized SHARE. From Wave 4 onward, both total financial and housing wealth also include the value of whole life insurance. HRS respondents are explicitly asked to exclude the cash value of any life insurance policies when reporting the value of their assets. See the single components of **hhWatotn** for other differences.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Income measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All income measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When an income component is missing it is imputed. We refer to the section “Missing Values, Nonresponse, and Imputations” earlier in this document for more details.

How Constructed

Earnings from employment is asked in the employment and pensions (EP) module for all respondents. For all waves, imputed earnings are provided at the individual-level. The EP module elicits the value of earnings by asking the respondent whether they had any earnings from employment in the previous year. If the respondent answers yes, then they are asked what the approximate income from employment was in the previous year.

rWiearn is the value of the respondent's earnings from employment in the previous year, before any tax and contributions. **rWiearn** is based on SHARE derived variables which include imputations for missing values. **rWifearn** is the imputation flag indicating whether the value of **rWiearn** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWiearn is the value of the respondent's spouse's earnings from employment in the previous year, before any tax and contributions and is taken directly from the spouse's value for **rWiearn**. **sWifearn** indicates whether the value of **sWiearn** was imputed or not and is based on the respondent's spouse's value for **rWifearn**. **sWiearn** and **sWifearn** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWitearn is the value of the respondent's earnings from employment in the previous year, after any taxes and contributions. **rWitearn** is based on SHARE derived variables which include imputations for missing values. **rWitfearn** is the imputation flag indicating whether the value of **rWitearn** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWitearn is the value of the respondent's spouse's earnings from employment in the previous year, after any taxes and contributions, and is taken directly from the spouse's value for **rWitearn**. **sWitfeearn** indicates whether the value of **sWitearn** was imputed or not and is based on the respondent's spouse's value for **rWitfeearn**. **sWitearn** and **sWitfeearn** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 1, income is asked before taxes and contributions, whereas from Wave 2 onward, it is asked after taxes and contributions. (In Austria, "and Contributions" was omitted.) This is indicated by different variable names. Specifically, for before tax measures we use the structure **rWi***, **sWi***, and **hWi***, while, for after tax measures, we use the structure **rWit***, **sWit***, and **hWit*** with the letter 't' denoting "after tax".

The wording of the question eliciting earnings from employment changed slightly between Wave 1, Wave 2, and Wave 4. In Wave 1, the survey asked, "Have you had any earnings at all from employment in 2003?" followed by the question, "Before any tax and contributions, what was your approximate income from employment in the year 2003?" From Wave 2 onward, the survey asked, "Have you had any wages, salaries or other earnings from dependent employment in [previous year]?" In Wave 2, the follow-up question was, "After any taxes and contributions, what was your approximate income from employment in the year [previous year]?" Starting in Wave 4, the follow-up question was, "After any taxes and contributions, what was your approximate annual income from employment in the year [previous year]? Please include any additional or extra or lump sum payment, such as bonuses, 13 month, Christmas or Summer pays." Hence, in Wave 1 the survey elicits pre-tax earnings from employment, while it elicits post-tax earnings from employment from Wave 2 onward. Since Wave 4, the question explicitly instructs the respondent to report additional pay besides their regular wage.

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not answer this question.

Cross-Study Differences with the HRS

In the RAND HRS, labor earnings include bonuses, commissions, tips, and income from professional practice. The SHARE questionnaire explicitly mentions these income components since Wave 4, but not in previous waves.

Unlike SHARE, the HRS consistently elicits before-tax income. The HRS, however, provides tax liability data for 2000 and 2002 (Rohwedder et al., 2005). The method used to generate those data can also be used to generate tax liability data for other years. However, this only gives total tax liability, from which total after tax income can be computed, but not after tax income per income component.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Income measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All income measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When an income component is missing it is imputed. We refer to the section “Missing Values, Nonresponse, and Imputations” earlier in this document for more details.

How Constructed

Household capital income includes many types of income: earnings from self-employment, income from real estate, income from bank accounts, income from bonds, income from stocks, and income from mutual funds.

Earnings from self-employment are asked in the employment and pensions (EP) module to all respondents. For all waves, imputed earnings are provided at the individual-level. The EP module elicits the value of self-employment earnings by asking the respondent whether they had any earnings from self-employment or worked for a family business in the previous year. If the respondent answers yes, then they are asked what the approximate income from self-employment was in the previous year, after paying for any materials, equipment or goods used in the work.

rWisemp is the value of the respondent's earnings from self-employment, before any tax and contributions. **rWisemp** is based on SHARE derived variables which include imputations for missing values. **rWifsemp** is the imputation flag indicating whether the value of **rWisemp** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWisemp is the value of the respondent's spouse's earnings from self-employment, before any tax and contributions and is taken directly from the spouse's value for **rWisemp**. **sWifsemp** indicates whether the value of **sWisemp** was imputed or not and is based on the respondent's spouse's value for **rWifsemp**. **sWisemp** and **sWifsemp** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWitsemp is the value of the respondent's earnings from self-employment, after any taxes and contributions. **rWitsemp** is based on SHARE derived variables which include imputations for missing values. **rWitfsemp** is the imputation flag indicating whether the value of **rWitsemp** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWitsemp is the value of the respondent's spouse's earnings from self-employment, after any taxes and contributions, and is taken directly from the spouse's value for **rWitsemp**. **sWitfsemp** indicates whether the value of **sWitsemp** was imputed or not and is based on the respondent's spouse's value for **rWitfsemp**. **sWitsemp** and **sWitfsemp** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Income from real estate is asked in the housing (HO) module to the household respondent on behalf of the whole household. Imputed values are provided at the household-level and couple-level values can only be derived for couples without any additional household members participating in the survey. The HO module elicits the value of income or rent from real estate by asking the respondent whether they own other real estate besides the primary residence and whether they received any income or rent from it in the last year. If the respondent answers yes, they are then asked how much income or rent they received from these properties in the last year.

hWirent is the value of rental income in the previous year, before any tax and contributions, at the couple-level economic unit (the respondent and spouse, if any). **hWirent** is based on SHARE derived variables which include imputations for missing values. Since **hWirent** records couple-level values that can only be derived for couples without any additional household members participating in the survey, a special missing value (.n) is assigned for respondents whose household is composed of other members in addition to the respondent and their spouse. **hWifrent** is the imputation flag indicating whether the value of **hWirent** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWirent is the value of rental income in the previous year, before any tax and contributions, at the household-level (all respondents in the household). **hhWirent** is based on SHARE derived variables which include imputations for missing values. **hhWifrent** is the imputation flag indicating whether the value of **hhWirent** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hWitrent is the value of rental income in the previous year, after any taxes and contributions, at the couple-level economic unit (the respondent and spouse, if any). **hWitrent** is based on SHARE derived variables which include imputations for missing values. Since **hWirent** records couple-level values that can only be derived for couples without any additional household members participating in the survey, a special missing value (.n) is assigned for respondents whose household is composed of other members in addition to the respondent and their spouse. A special missing value (.i) indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). **hWitfrent** is the imputation flag indicating whether the value of **hWitrent** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -3 indicates that the value is missing because the

respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWitrent is the value of rental income in the previous year, after any taxes and contributions, at the household-level (all respondents in the household). A special missing value (.i) indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). **hhWitrent** is based on SHARE derived variables which include imputations for missing values. **hhWitfrent** is the imputation flag indicating whether the value of **hhWitrent** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Incomes from bank accounts, bonds, stocks, and mutual funds are all asked in the asset (AS) module to the financial respondent on behalf of themselves and their spouse/partner, if any. Imputed values are provided at the couple-level therefore household-level values can be derived for all respondents.

In Waves 1 and 2, the AS module elicits the value of income from bank accounts by asking the respondent whether they have bank accounts, transaction accounts, savings accounts, or postal accounts and how much interest income they received from those accounts in the last year. In Wave 4, the AS module elicits the value of income from bank accounts by asking the respondent whether they have bank accounts, transaction accounts, savings accounts, or postal accounts and the total balance of these accounts. Interest income from these accounts is computed by SHARE by multiplying the reported balance by a 1% fixed interest rate. Starting in Wave 5, SHARE elicits the value of income from bank accounts together with the value of income from bonds, stocks, and mutual funds as a single question.

In Waves 1 and 2, the AS module elicits the value of income from bonds by asking the respondent whether they have government or corporate bonds and how much interest income they received from these bonds in the last year. In Wave 4, the AS module elicits the value of income from bonds by asking the respondent whether they have government or corporate bonds and the value of these bonds. Interest income from these assets is computed by SHARE by multiplying the value of these assets by a 5% fixed interest rate. Starting in Wave 5, SHARE elicits the value of income from bonds together with the value of income from bank accounts, stocks, and mutual funds as a single question.

In Waves 1 and 2, the AS module elicits the value of income from stocks by asking the respondent whether they have stocks or shares and how much dividend income they received from these stocks in the last year. In Wave 4, the AS module elicits the value of income from stocks or shares by asking the respondent whether they have stocks or shares and the value of these stocks and shares. Interest income from these assets is computed by SHARE by multiplying the value of these assets by a 5% fixed interest rate. Starting in Wave 5, SHARE elicits the value of income from stocks together with the value of income from bank accounts, bonds, and mutual funds as a single question.

In Waves 1 and 2, the AS module elicits the value from mutual funds by asking the respondent whether they have mutual funds or managed investment accounts and how much interest or dividend income they received from these mutual funds or managed investment accounts in the last year. In Wave 4, the AS module elicits the value of income from mutual funds by asking the respondent whether they have mutual funds or managed investment accounts and the value of these mutual funds and managed investment accounts. Interest income from these assets is computed by SHARE by multiplying the value of these assets by a 5% fixed interest rate. Starting in Wave 5, SHARE elicits the value of income from mutual funds together with the value of income from bank accounts, bonds, and stocks as a single question.

hWitrest is the value of interest income from financial assets in the previous year, before any tax and contributions, at the couple-level economic unit (the respondent and spouse, if any). **hWitrest** is based on SHARE derived variables which include imputations for missing values. **hWiftrrest** is the imputation flag indicating whether the value of **hWitrest** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed

based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWitrest is the value of interest income from financial assets in the previous year, before any tax and contributions, at the household-level (all respondents in the household). **hhWitrest** is based on SHARE derived variables which include imputations for missing values. **hhWitftrest** is the imputation flag indicating whether the value of **hhWitrest** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hWittrest is the value of interest income from financial assets in the previous year, after any taxes and contributions, at the couple-level economic unit (the respondent and spouse, if any). **hWittrest** is based on SHARE derived variables which include imputations for missing values. **hWitftrest** is the imputation flag indicating whether the value of **hWittrest** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Please note, that due to the presence of some extremely high values in the SHARE imputed variable for France, values greater than 1,000,000 have been set equal to (.m) missing for **hWittrest** in Wave 5. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWittrest is the value of interest income from financial assets in the previous year, after any taxes and contributions, at the household-level (all respondents in the household). **hhWittrest** is based on SHARE derived variables which include imputations for missing values. **hhWitftrest** is the imputation flag indicating whether the value of **hhWittrest** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. A special missing code (.m) is used for **hWitftrest** if the imputation flag indicates “not designed respondent”. Please note, that due to the presence of some extremely high values in the SHARE imputed variable for France, values greater than 1,000,000 have been set equal to (.m) missing for **hhWittrest** in Wave 5. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hWicap is the sum of all capital income in the previous year, before any tax and contributions, at the couple-level economic unit (the respondent and spouse, if any). That is, the sum of **rWisemp** (for both the respondent and the spouse, if any), **hWirent**, and **hWitrest**. A value for **hWicap** is only calculated if there are values for all component variables. A special missing value (.n) indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A special missing value (.s) indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide imputations for non-responding spouses. **hWifcap** is a flag indicating whether any components of **hWicap** were imputed. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3 indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -2 indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide imputations for non-responding spouses. A code of -3 indicates that the value

is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWicap is the sum of all capital income in the previous year, before any tax and contributions, at the household-level (all respondents in the household). That is, the sum of **rWisemp** (for all household respondents), **hhWirent**, and **hhWitrest**. A value for **hhWicap** is only calculated if there are values for all component variables. A special missing value (.s) indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide imputations for non-responding spouses. **hhWifcap** is a flag indicating whether any components of **hhWicap** were imputed. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3 indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. A code of -2 indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide imputations for non-responding spouses. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hWicap is the sum of all capital income in the previous year, after any tax and contributions, at the couple-level economic unit (the respondent and spouse, if any). That is, the sum of **rWitsem** (for both the respondent and the spouse, if any), **hWitrent**, and **hWittrest**. A value for **hWicap** is only calculated if there are values for all component variables. A special missing value (.n) indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A special missing value (.s) indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide imputations for non-responding spouses. A special missing value (.i) indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). **hWicap** is assigned special missing value (.m) if any of its components have a special missing value (.m). **hWifcap** is a flag indicating whether any components of **hWicap** were imputed. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3 indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -2 indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide imputations for non-responding spouses. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWitcap is the sum of all capital income in the previous year, after any tax and contributions, at the household-level (all respondents in the household). That is, the sum of **rWitsem** (for all household respondents), **hhWitrent**, and **hhWittrest**. A value for **hhWitcap** is only calculated if there are values for all component variables. A special missing value (.s) indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide imputations for non-responding spouses. A special missing value (.i) indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). **hhWitcap** is assigned special missing value (.m) if any of its components have a special missing value (.m). **hhWitfcap** is a flag indicating whether any components of **hhWitcap** were imputed. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3 indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. A code of -2 indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide

imputations for non-responding spouses. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In Wave 1, income is asked before taxes and contributions, whereas from Wave 2 onward it is asked after taxes and contributions. (In Austria, "and Contributions" was omitted.) This is indicated by different variable names. Specifically, for before tax measures we use the structure **rWi***, **sWi***, and **hWi***, while, for after tax measures, we use the structure **rWit***, **sWit***, and **hWit*** with the letter 't' denoting "after tax".

In Wave 1 and Wave 2, only one household respondent is allowed to answer the HO module. In Wave 4 and forward, multiple household respondents can complete the HO module but the imputations are only based on one of those respondents' answers.

In Wave 1, couples were asked whether they kept finances together or separate. If they kept finances separate, both individuals answered the AS module. If they kept finances together, the one most knowledgeable about the couple's finances was selected as the financial respondent and this individual answered the AS module on behalf of the couple. From Wave 2 onward, couples were not given the option to report separately and one financial respondent was always chosen.

The wording of the question eliciting earnings from self-employment differs slightly between Wave 1 and Wave 2 onward. In Wave 1, the survey asked, "Have you had any income at all from self-employment or work for a family business in 2003?" followed by the question, "Before any tax and contributions, but after paying for any materials, equipment or goods that you use in your work, what was your approximate income from self-employment in the year 2003?" From Wave 2 onward, the survey asked, "Have you had any income at all from self-employment or work for a family business in [previous year]?", followed by the question, "After any taxes and contributions and after paying for any materials, equipment or goods that you use in your work, what was your approximate income from self-employment in the year [previous year]?" Hence, in Wave 1 the survey elicits pre-tax income, while it elicits post-tax income from Wave 2 onward.

The wording of the question eliciting income from real estate changed slightly between Wave 1, Wave 2, and Wave 4. In Wave 1, the survey asked, "Not including special time-sharing arrangements, do you own secondary homes, holiday homes, other real estate, land or forestry?" followed by the question, "Did you receive any income or rent from these properties in 2003?" and, "How much income or rent did you receive from these properties during 2003, before taxes?" In Wave 2, the survey asked, "Not including special time-sharing arrangements, do you own secondary homes, holiday homes, other real estate, land or forestry?" followed by the question, "Did you receive any income or rent from these properties in [previous year]?" and "How much income or rent did you receive from these properties during [previous year], after taxes?" In Waves 4 and onward, the survey asked, "Do you own secondary homes, holiday homes, other real estate, land or forestry? Please do not include: time-sharing arrangement, own business" followed by the question, "Did you receive any income or rent from these properties in [previous year]?" and "How much income or rent did you receive from these properties during [previous year], after taxes?" Hence, in Wave 1 the survey elicits pre-tax income or rent from real estate, while it elicits post-tax income or rent from real estate from Wave 2 onward. In Wave 4 and forward, the question explicitly instructs respondents to exclude not only time-sharing arrangements, but also own business. From Wave 5 onward, real estate income includes the income received by respondents living in nursing homes. In Wave 7, SHARE did not include unfolding bracket questions if the respondent was not able to provide a value for rental income.

The wording of the questions eliciting income from bank accounts, bonds, stocks, and mutual funds changed slightly between Wave 1 and Wave 2, significantly at Wave 4, and significantly at Wave 5. In Wave 1, ownership of most financial assets was asked in one "check all that apply" question using a show card. The show card read: "Looking at this card, which, if any, of these savings and investments do you have? 1. Bank accounts, transaction accounts or saving accounts, 2. Government or corporate bonds, 3. Stocks or shares (listed or unlisted on stock market), 4. Mutual funds or managed investment accounts, 5. Individual retirements accounts, 6. Contractual saving for housing, 7. Life insurance, 96. None of these." For each owned asset, the respondent was asked, "About how much interest income did you receive in [previous year] before taxes?" In Wave 2, ownership of financial assets was asked through separate questions: "Do you currently have any money in bank accounts, transaction accounts, saving accounts or postal accounts?", "Do you currently have any money in government or corporate bonds?", "Do you currently have any money in stocks or shares (listed or unlisted on stock market)?", "Do you currently have any money in mutual funds or managed investment accounts?" In Wave 2, interviewer notes were also included, namely:

"Bonds are a debt instrument issued by the government or a corporation in order to generate capital by borrowing", "Stocks are pieces of paper that show that the person owns part of a corporation and has the right to receive dividends from it", and "Mutual funds are a pool of money belonging to many investors who trust a manager to invest it in stocks and/or bonds." For each owned asset, the respondent was asked "After taxes, about how much interest income did you receive in [previous year]?"

In Wave 4, ownership of financial assets was asked through separate questions: "Do you currently have any money in bank accounts, transaction accounts, saving accounts or postal accounts?", "Do you currently have any money in government or corporate bonds? Bonds are a debt instrument issued by the government or a corporation in order to generate capital by borrowing", "Do you currently have any money in stocks or shares (listed or unlisted on stock market)? Stocks are a form of investment that allows a person to own a part of a corporation and gives him/her the right to receive dividends from it", "Do you currently have any money in mutual funds or managed investment accounts? A mutual fund is a form of investment which is set up by a financial institution that collects money from many investors and gives it to a manager to invest it in stocks, bonds, and other financial products." For each owned asset, the respondent was asked, "About how much do you currently have in these accounts?" Interest income from these assets is computed by SHARE by multiplying the value of these assets by a fixed interest rate. SHARE uses a rate of 1% for interest income for bank accounts and a rate of 5% for bonds, stocks, and mutual funds. Starting in Wave 5, income from bank accounts, bonds, stocks, and mutual funds was asked in one single question: "Overall, about how much interest or dividend income did you receive from your savings in bank accounts, bonds, stocks or mutual funds?" This question was asked to all respondents who reported ownership of any one of the four financial assets.

Hence, in Wave 1, the survey elicits pre-tax asset income, while it elicits post-tax asset income from Wave 2 onward. As is clear, the wording changed slightly: in Wave 1, respondents were asked whether they had a bank account, not whether they had any money in it, whereas from Wave 2 onward, they were asked whether they had any money in a bank account. Furthermore, from Wave 2 onward, "postal account" was added. While the question wording about ownership of financial assets did not change significantly from Wave 2 onward, SHARE did not include questions about income from financial assets in Wave 4. Instead in Wave 4, the income from financial assets is computed by SHARE by multiplying the values of assets by fixed interest rates. Starting in Wave 5, SHARE again included questions about income from financial assets, but instead of asking income for each type of financial asset (as in Wave 1 and 2), SHARE asks one question about income from all types of financial assets. Therefore, income from bank accounts, bonds, stocks, and mutual funds are constructed values in Wave 4, not survey values as in Waves 1 and 2 and since Wave 5.

In Wave 1, the value of the assets at the end of the previous year was asked, so for an interview in 2004, the value at the end of 2003 was asked. However, the "check all that apply" question above seems to ask for current ownership. In Wave 2, both ownership and value were asked for the current date.

Please note, that due to the presence of some extremely high values in the SHARE imputed variable for interest income for France in Wave 5, values greater than 1,000,000 have been set equal to special missing value (.m) for **hWittrest** and **hhWittrest**. This also impacts the sums in **hWitcap**, **hhWitcap**, and **hWittot**.

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not answer any of the above income questions.

Cross-Study Differences with the HRS

Unlike SHARE, the HRS consistently elicits before-tax income. The HRS however, provides tax liability data for 2000 and 2002 (Rohwedder et al., 2005). The method used to generate those data can also be used to generate tax liability data for other years. However, this only gives total tax liability, from which total after tax income can be computed, but not after tax income per income component.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Income measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All income measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When an income component is missing it is imputed. We refer to the section “Missing Values, Nonresponse, and Imputations” earlier in this document for more details.

How Constructed

Income from an employer pension or annuity is elicited in the employment and pensions (EP) module for all respondents. The EP module asks the respondent whether they received any income from private (occupational) old age pension, private (occupational) old age pension from a second job, private (occupational) old age pension from a third job, private (occupational) early retirement pension, private (occupational) disability or invalidity insurance, or private (occupational) survivor pension from your spouse or partner's job, life insurance payment received, private annuity or private personal pension, or private health insurance payments received in the previous year. Note however that there are cross-country differences in how the pension or annuity questions are asked. For example, in Sweden, the list of occupational pensions includes ones for blue-collar, white-collar, government, and municipal and local government workers. Though for all countries, if the respondent reports receiving any specific type of pension, annuity, or payment, then they are either asked: 1) how large the average or typical payment in the previous year was and what period of time the payment covered: one week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, or other; or 2) just the approximate annual amount of payments in the previous year. If a payment time period is chosen, the respondent is finally asked how many total months the payment was received in the previous year.

rWipena is the value of the respondent's income from employer pension or annuity in the previous year, before any tax and contributions. **rWipena** is based on SHARE derived variables which compute annual pension income by multiplying the respondent's reported per-period (e.g., monthly) payment by the reported number of periods (months) during which it was received. SHARE derived variables include imputations for missing values. **rWifpena** is the imputation flag indicating whether the value of **rWipena** was imputed or not. The SHARE imputations file provides imputation flags for the annual amount, but it does not include the periodicity or its imputation status as separate variables from the pay-period amount. We treat the imputation flags for annual amounts as if they were imputation flags for pay-period amounts, implicitly assuming that the periodicity was not imputed. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWipena is the value of the respondent's spouse's income from employer pension or annuity in the previous year, before any tax and contributions and is taken directly from the spouse's value for **rWipena**. **sWifpena** indicates whether the value

of **sWipena** was imputed or not and is based on the respondent's spouse's value for **rWifpena**. **sWipena** and **sWifpena** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWitpena is the value of the respondent's income from employer pension or annuity in the previous year, after any tax and contributions. **rWitpena** is based on SHARE derived variables which compute annual pension income by multiplying the respondent's reported per-period (e.g., monthly) payment by the reported number of periods (months) during which it was received. SHARE derived variables include imputations for missing values. **rWitfpena** is the imputation flag indicating whether the value of **rWitpena** was imputed or not. The SHARE imputations file provides imputation flags for the annual amount, but it does not include the periodicity or its imputation status as separate variables from the pay-period amount. We treat the imputation flags for annual amounts as if they were imputation flags for pay-period amounts, implicitly assuming that the periodicity was not imputed. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWitpena is the value of the respondent's spouse's income from employer pension or annuity in the previous year, after any tax and contributions and is taken directly from the spouse's value for **rWitpena**. **sWitfpena** indicates whether the value of **sWitpena** was imputed or not and is based on the respondent's spouse's value for **rWitfpena**. **sWitpena** and **sWitfpena** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 1, income is asked before taxes and contributions, whereas from Wave 2 onward, it is asked after taxes and contributions. (In Austria, "and Contributions" was omitted.) This is indicated by different variable names. Specifically, for before tax measures we use the structure **rWi***, **sWi***, and **hWi***, while, for after tax measures, we use the structure **rWit***, **sWit***, and **hWit*** with the letter 't' denoting "after tax".

Pension systems, government transfer programs, etc., differ considerably across SHARE countries. Despite the effort of the SHARE teams to harmonize questionnaires, there appear to be many differences across countries justified by specific institutional frameworks. The SHARE website provides a list of known differences here for Waves 1 and 2: <https://share-eric.eu/data/data-documentation/questionnaires/country-specific-deviations>.

The occupational early retirement category is not present in Germany. Sweden has a very different list of public and occupational pensions (as discussed in the above "How Constructed" section).

In addition to significant cross-country differences, the public and occupational pension question wording changed significantly between Wave 1 and Wave 2, and again in Wave 6. In Wave 1, the survey asked, "Have you received income from any of these sources in the year 2003?" and presented the respondent with the following show card: "1.Public old age pension, 2.Public early retirement or pre-retirement pension, 3.Public disability insurance, 4.Public unemployment benefit or insurance, 5.Public survivor pension from your spouse or partner, 6.Public invalidity or incapacity pension, 7.War pension, 8.Private (occupational) old age pension, 9.Private (occupational) early retirement pension, 10.Private (occupational) disability or invalidity insurance, 11.Private (occupational) survivor pension from your spouse or partner's job, 96.None of these." For each received pension type, the respondent was then asked, "Before taxes, about how large was the average payment in 2003?" The respondent was then asked "What period did that payment cover?" with the following answer options: One week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, other(specify). Next, the respondent was asked, "For how many months altogether did you receive [income source] in 2003?"

Starting in Wave 2, the survey asked, "Have you received income from any of these sources in [previous year]?" and presented the respondent with the following show card: "1.Public old age pension, 2.Public old age supplementary pension or public old age second pension, 3.Public early retirement or pre-retirement pension, 4.Main public disability insurance pension,

or sickness benefits, 5.Secondary public disability insurance pension, or sickness benefits, 6.Public unemployment benefit or insurance, 7.Main public survivor pension from your spouse or partner, 8.Secondary public survivor pension from your spouse or partner, 9.Public war pension, 10.Public long-term care insurance, 96. None of these." For each received pension type, the respondent was then asked, "After taxes, about how large was a typical payment in [previous year]?" and, "What period did that payment cover?" with the following answer options: One week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, other(specify). Next, the respondent was asked, "For how many months altogether did you receive [income source] in [previous year]?" After public pensions, the survey asked, "Have you received income from any of these sources in [previous year]?" and presented the respondent with the following show card: "1.Occupational old age pension from your last job, 2.Occupational old age pension from a second job, 3.Occupational old age pension from a third job, 4.Occupational early retirement pension, 5.Occupational disability or invalidity insurance, 6.Occupational survivor pension from your spouse or partner's job, 96.None of these." For each received pension type, the respondent was then asked, "After taxes, about how large was a typical payment in [previous year]?" and, "What period did that payment cover?" with the following answer options: One week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, other(specify). Next, the respondent was asked, "For how many months altogether did you receive [income source] in [previous year]?" Starting in Wave 6, the survey asks about public types of pensions in the same way, followed by, "In addition to public pension benefits, pensions can also be provided through your employer. Have you received income from any occupational pension in the year [previous year]?" If the respondent reported receiving an occupational pension, the survey then asked, "After taxes, what was the approximate annual amount received from all your occupational pensions in [previous year]?"

Hence, ownership of all types of pensions were asked together in Wave 1, while in Wave 2 and forward, ownership of public types of pensions were asked separately from ownership of occupational pensions. Also note that public and occupational pension categories changed between Wave 1 and Wave 2. After asking about the period over which benefits were received (e.g., whether weekly or monthly), respondents in Wave 1 were asked the "average payment", whereas in Waves 2, 4, and 5, they were asked the "typical payment". Also in Waves 2 through 5, individual occupational pensions were asked about, whereas starting in Wave 6, occupational pensions were combined into a single question.

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not answer this question.

Cross-Study Differences with the HRS

Unlike SHARE, the HRS consistently elicits before-tax income. The HRS however, provides tax liability data for 2000 and 2002 (Rohwedder et al., 2005). The method used to generate those data can also be used to generate tax liability data for other years. However, this only gives total tax liability, from which total after tax income can be computed, but not after tax income per income component.

Unlike **rWipena** in the RAND HRS, **rWipena** in the Gateway Harmonized SHARE includes life insurance payments.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Income measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All income measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When an income component is missing it is imputed. We refer to the section “Missing Values, Nonresponse, and Imputations” earlier in this document for more details.

How Constructed

Public pension income includes two types of pension income: public disability pension income and public old age + early retirement pension income.

Income from public disability pensions is elicited in the employment and pensions (EP) module for all respondents. In all countries except Sweden, the EP module asks the respondent whether they received any income from public disability pensions insurance, public invalidity or incapacity pension, or secondary public disability insurance pension in the previous year. For Sweden, the list includes invalidity and public disability pensions or secondary public disability insurance pension in the previous year. For all countries, if the respondent reports receiving any specific type of pension, then they are asked how large the average payment in the previous year was and what period of time the payment covered: one week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, or other. The respondent is finally asked how many months altogether was the payment received in the previous year.

rWisssi is the value of the respondent's income from public disability pensions in the previous year, before any tax and contributions. **rWisssi** is based on SHARE derived variables which compute annual pension income by multiplying the respondent's reported per-period (e.g., monthly) payment by the reported number of periods (months) during which it was received. SHARE derived variables include imputations for missing values. **rWifssdi** is the imputation flag indicating whether the value of **rWisssi** was imputed or not. The SHARE imputations file provides imputation flags for the annual amount, but it does not include the periodicity or its imputation status as separate variables from the pay-period amount. We treat the imputation flags for annual amounts as if they were imputation flags for pay-period amounts, implicitly assuming that the periodicity was not imputed. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWisssi is the value of the respondent's spouse's income from public disability pensions in the previous year, before any tax and contributions and is taken directly from the spouse's value for **rWisssi**. **sWifssdi** indicates whether the value of **sWisssi** was imputed or not and is based on the respondent's spouse's value for **rWifssdi**. **sWisssi** and **sWifssdi** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWitssdi is the value of the respondent's income from public disability pensions in the previous year, after any tax and contributions. **rWitssdi** is based on SHARE derived variables which compute annual pension income by multiplying the respondent's reported per-period (e.g., monthly) payment by the reported number of periods (months) during which it was received. SHARE derived variables include imputations for missing values. **rWitfssdi** is the imputation flag indicating whether the value of **rWitssdi** was imputed or not. The SHARE imputations file provides imputation flags for the annual amount, but it does not include the periodicity or its imputation status as separate variables from the pay-period amount. We treat the imputation flags for annual amounts as if they were imputation flags for pay-period amounts, implicitly assuming that the periodicity was not imputed. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWitssdi is the value of the respondent's spouse's income from public disability pensions in the previous year, after any tax and contributions and is taken directly from the spouse's value for **rWitssdi**. **sWitfssdi** indicates whether the value of **sWitssdi** was imputed or not and is based on the respondent's spouse's value for **rWitfssdi**. **sWitssdi** and **sWitfssdi** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Income from public old age + early retirement pensions is elicited in the employment and pensions (EP) module for all re-

spondents. In all countries except Sweden, the EP module asks the respondent whether they received any income from public old age pension, public early or pre-retirement pension, public survivor pension from partner, public old age supplementary/2nd pension, secondary public survivor pension from spouse/partner, or war pensions. For Sweden, the list includes public old age pension, survivor pension, public old age supplementary/2nd pension, or secondary public survivor pension from spouse/partner in the previous year. For all countries, if the respondent reports receiving any specific type of pension, then they are asked how large the average payment in the previous year was and what period of time the payment covered: one week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, or other. The respondent is finally asked how many months altogether was the payment received in the previous year.

rWisret is the value of the respondent's income from public old age + early retirement pensions in the previous year, before any tax and contributions. **rWisret** is based on SHARE derived variables which compute annual pension income by multiplying the respondent's reported per-period (e.g., monthly) payment by the reported number of periods (months) during which it was received. SHARE derived variables include imputations for missing values. **rWifsret** is the imputation flag indicating whether the value of **rWisret** was imputed or not. The SHARE imputations file provides imputation flags for the annual amount, but it does not include the periodicity or its imputation status as separate variables from the pay-period amount. We treat the imputation flags for annual amounts as if they were imputation flags for pay-period amounts, implicitly assuming that the periodicity was not imputed. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWisret is the value of the respondent's spouse's income from public old age + early retirement pensions in the previous year, before any tax and contributions and is taken directly from the spouse's value for **rWisret**. **sWifsret** indicates whether the value of **sWisret** was imputed or not and is based on the respondent's spouse's value for **rWifsret**. **sWisret** and **sWifsret** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWitsret is the value of the respondent's income from public old age + early retirement pensions in the previous year, after any tax and contributions. **rWitsret** is based on SHARE derived variables which compute annual pension income by multiplying the respondent's reported per-period (e.g., monthly) payment by the reported number of periods (months) during which it was received. SHARE derived variables include imputations for missing values. **rWitsret** is the imputation flag indicating whether the value of **rWitsret** was imputed or not. The SHARE imputations file provides imputation flags for the annual amount, but it does not include the periodicity or its imputation status as separate variables from the pay-period amount. We treat the imputation flags for annual amounts as if they were imputation flags for pay-period amounts, implicitly assuming that the periodicity was not imputed. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWitsret is the value of the respondent's spouse's income from public old age + early retirement pensions in the previous year, after any tax and contributions and is taken directly from the spouse's value for **rWitsret**. **sWitsret** indicates whether the value of **sWitsret** was imputed or not and is based on the respondent's spouse's value for **rWitsret**. **sWitsret** and **sWitsret** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWipubpen is the sum of all public pension income in the previous year, before any tax and contributions, at the respondent-level. That is, the sum of **rWisdi** and **rWisret**. **rWipubpen** is a flag indicating whether any components of **rWipubpen** were imputed. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3

indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWipubpen is the value of the respondent's spouse's income from public pensions in the previous year, before any tax and contributions and is taken directly from the spouse's value for **rWipubpen**. **sWifpubpen** indicates whether any components of **sWipubpen** were imputed and is based on the respondent's spouse's value for **rWifpubpen**. **sWipubpen** and **sWifpubpen** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWitpubpen is the sum of all public pension income in the previous year, after any tax and contributions, at the respondent-level. That is, the sum of **rWitssdi** and **rWitsret**. **rWitfpubpen** is a flag indicating whether any components of **rWitpubpen** were imputed. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3 indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWitpubpen is the value of the respondent's spouse's income from public pensions in the previous year, after any tax and contributions and is taken directly from the spouse's value for **rWitpubpen**. **sWitfpubpen** indicates whether any components of **sWitpubpen** were imputed and is based on the respondent's spouse's value for **rWitfpubpen**. **sWitpubpen** and **sWitfpubpen** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 1, respondents of Euro countries were allowed to choose whether to report financial amounts in Euros or in their local pre-Euro currency. From Wave 2 onward, amounts were reported in Euros for all Euro countries. In Waves 1 and 2, SHARE provides asset values in the currency in which they were elicited. For these two first waves we convert these values into nominal Euros using the nominal exchange rate as provided by SHARE for the year in which the survey was conducted. Since Wave 4, SHARE provides asset measures in nominal Euros for all respondents regardless of the currency used in the survey so no further conversion is necessary.

In Wave 1, income is asked before taxes and contributions, whereas from Wave 2 onward it is asked after taxes and contributions. (In Austria, "and Contributions" was omitted.) This is indicated by different variable names. Specifically, for before tax measures we use the structure **rWi***, **sWi***, and **hWi***, while, for after tax measures, we use the structure **rWit***, **sWit***, and **hWit*** with the letter 't' denoting "after tax".

Pension systems, government transfer programs, etc., differ considerably across SHARE countries. Despite the effort of the SHARE teams to harmonize questionnaires, there appear to be many differences across countries justified by specific institutional frameworks. The SHARE website provides a list of known differences here: <https://share-eric.eu/data/data-documentation/questionnaires/country-specific-deviations>.

In France, the category "public disability insurance" is not present. In Germany, the category "public invalidity or incapacity pension" is not present. For some countries (e.g., the Netherlands), welfare transfers are likely included in the "public invalidity or incapacity pension" category, and, therefore, in this harmonized variable. Sweden has a different list of public disability pensions (as discussed in the above "How Constructed" section).

In Austria, Spain, and Greece, SHARE uses 14 months of pay when calculating annual income from public disability pensions whenever respondents report receiving a payment for 12 months. In Italy, SHARE uses 13 months of pay when calculating annual income from public disability pensions whenever respondents report receiving a payment for 12 months.

The war pension category is not present in Switzerland and the Netherlands. For Sweden, the questionnaire does not include a question about war pensions.

In Austria, Spain, and Greece, SHARE uses 14 months of pay when calculating annual income from war pensions whenever respondents report receiving a payment for 12 months. In Italy, SHARE uses 13 months of pay when calculating annual income from war pensions whenever respondents report receiving a payment for 12 months.

In addition to significant cross-country differences, the question wording changed significantly between Wave 1 and Wave 2, and again in Wave 6. In Wave 1, the survey asked, "Have you received income from any of these sources in the year 2003?" and presented the respondent with the following show card: "1.Public old age pension, 2.Public early retirement or pre-retirement pension, 3.Public disability insurance, 4.Public unemployment benefit or insurance, 5.Public survivor pension from your spouse or partner, 6.Public invalidity or incapacity pension, 7.War pension, 8.Private (occupational) old age pension, 9.Private (occupational) early retirement pension, 10.Private (occupational) disability or invalidity insurance, 11.Private (occupational) survivor pension from your spouse or partner's job, 96.None of these." For each received pension type, the respondent was then asked, "Before taxes, about how large was the average payment in 2003?" The respondent was then asked "What period did that payment cover?" with the following answer options: One week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, other(specify). Next, the respondent was asked, "For how many months altogether did you receive [income source] in 2003?" Starting in Wave 2, the survey first asked, "Have you received income from any of these sources in [previous year]?" and presented the respondent with the following show card: "1.Public old age pension, 2.Public old age supplementary pension or public old age second pension, 3.Public early retirement or pre-retirement pension, 4.Main public disability insurance pension, or sickness benefits, 5.Secondary public disability insurance pension, or sickness benefits, 6.Public unemployment benefit or insurance, 7.Main public survivor pension from your spouse or partner, 8.Secondary public survivor pension from your spouse or partner, 9.Public war pension, 10.Public long-term care insurance, 96. None of these." For each received pension type, the respondent was then asked, "After taxes, about how large was a typical payment in [previous year]?" and "What period did that payment cover?" with the following answer options: One week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, other(specify). Next, the respondent was asked, "For how many months altogether did you receive [income source] in [previous year]?"

Starting in Wave 6, the survey asked, "Have you received income from any of these sources in [previous year]?" and presented the respondent with the following show card: "1.Public old age pension, 2.Public old age supplementary pension or public old age second pension, 3.Public early retirement or pre-retirement pension, 4.Main public sickness benefits, 5.Main public disability insurance pension, 6.Secondary public disability insurance pension, 7.Secondary public sickness benefits, 8.Public unemployment benefit or insurance, 9.Main public survivor pension from your spouse or partner, 10.Secondary public survivor pension from your spouse or partner, 11.Public war pension, 12.Public long-term care insurance, 13.Social assistance, 96.None of these." For each received pension type, the respondent was then asked, "After taxes, about how large was a typical payment in [previous year]?" and "What period did that payment cover?" with the following answer options: One week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, other(specify). As is clear, ownership of all types of pensions were asked together in Wave 1, while in Wave 2 and forward, ownership of public types of pensions were asked separately from ownership of occupational pensions. Also note that the categories changed between Wave 1 and Wave 2, and between Wave 2 and Wave 6. After asking about the period over which benefits were received (e.g., whether weekly or monthly), respondents in Wave 1 were asked the "average payment", whereas in Wave 2 and forward, they were asked the "typical payment".

For `rWitssdi` and `sWitssdi` in Waves 2 to 5, the respondent's income from disability pensions/benefits included main and secondary public disability pensions and main and secondary sickness benefits. Starting in Wave 6, the respondent's income from disability pensions/benefits includes main and secondary public disability pensions, but no longer includes main and secondary sickness benefits because of how the underlying imputed variables were changed.

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not answer questions about public pensions.

Cross-Study Differences with the HRS

Unlike SHARE, the HRS consistently elicits before-tax income. The HRS however, provides tax liability data for 2000 and 2002 (Rohwedder et al., 2005). The method used to generate those data can also be used to generate tax liability data for

other years. However, this only gives total tax liability, from which total after tax income can be computed, but not after tax income per income component.

The RAND HRS includes welfare in **rWigxfr** and not in **rWissdi**.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

Continuous Variable Distributions

General Comments:

Income measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All income measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When an income component is missing it is imputed. We refer to the section “Missing Values, Nonresponse, and Imputations” earlier in this document for more details.

How Constructed

Income from other government transfers is elicited in the employment and pensions (EP) module for all respondents. In many countries, the EP module elicits the value of income from other government transfers by asking the respondent whether they received any income from public unemployment benefit or insurance, public social assistance, or public sickness benefits or pensions in the previous year. If the respondent reports receiving any specific type of benefit, then they are asked how large the average payment in the previous year was and what period of time the payment covered: one week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, or other. The respondent is finally asked how many months altogether was the payment received in the previous year.

rWigxfr is the value of the respondent's income from other government transfers in the previous year, before any tax and contributions. **rWigxfr** is based on SHARE derived variables which compute annual transfer income by multiplying the respondent's reported per-period (e.g., monthly) payment by the reported number of periods (months) during which it was received. SHARE derived variables include imputations for missing values. **rWifgxfr** is the imputation flag indicating whether the value of **rWigxfr** was imputed or not. The SHARE imputations file provides imputation flags for the annual amount, but it does not include the periodicity or its imputation status as separate variables from the pay-period amount. We treat the imputation flags for annual amounts as if they were imputation flags for pay-period amounts, implicitly assuming that the periodicity was not imputed. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWigxfr is the value of the respondent's spouse's income from other government transfers in the previous year, before any tax and contributions and is taken directly from the spouse's value for **rWigxfr**. **sWifgxfr** indicates whether the value of **sWigxfr** was imputed or not and is based on the respondent's spouse's value for **rWifgxfr**. **sWigxfr** and **sWifgxfr** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not

report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWitgxfr is the value of the respondent's income from other government transfers in the previous year, after any tax and contributions. **rWitgxfr** is based on SHARE derived variables which compute annual transfer income by multiplying the respondent's reported per-period (e.g., monthly) payment by the reported number of periods (months) during which it was received. SHARE derived variables include imputations for missing values. **rWitfgxfr** is the imputation flag indicating whether the value of **rWitgxfr** was imputed or not. The SHARE imputations file provides imputation flags for the annual amount, but it does not include the periodicity or its imputation status as separate variables from the pay-period amount. We treat the imputation flags for annual amounts as if they were imputation flags for pay-period amounts, implicitly assuming that the periodicity was not imputed. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWitgxfr is the value of the respondent's spouse's income from other government transfers in the previous year, after any tax and contributions and is taken directly from the spouse's value for **rWitgxfr**. **sWitfgxfr** indicates whether the value of **sWitgxfr** was imputed or not and is based on the respondent's spouse's value for **rWitfgxfr**. **sWitgxfr** and **sWitfgxfr** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 1, income is asked before taxes and contributions, whereas from Wave 2 onward, it is asked after taxes and contributions. (In Austria, "and Contributions" was omitted.) This is indicated by different variable names. Specifically, for before tax measures we use the structure **rWi***, **sWi***, and **hWi***, while, for after tax measures, we use the structure **rWit***, **sWit***, and **hWit*** with the letter 't' denoting "after tax".

Pension systems, government transfer programs, etc., differ considerably across SHARE countries. Despite the effort of the SHARE teams to harmonize questionnaires, there appear to be many differences across countries justified by specific institutional frameworks. The SHARE website provides a list of known differences here: <https://share-eric.eu/data/data-documentation/questionnaires/country-specific-deviations>.

In Austria, Spain, and Greece, SHARE uses 14 months of pay when calculating annual income from unemployment and workers compensation whenever respondents report receiving a payment for 12 months. In Italy, SHARE uses 13 months of pay when calculating annual income from unemployment and workers compensation whenever respondents report receiving a payment for 12 months.

In addition to significant cross-country differences, the question wording changed significantly between Wave 1 and Wave 2, and again in Wave 6. In Wave 1, the survey asked, "Have you received income from any of these sources in the year 2003?" and presented the respondent with the following show card: "1.Public old age pension, 2.Public early retirement or pre-retirement pension, 3.Public disability insurance, 4.Public unemployment benefit or insurance, 5.Public survivor pension from your spouse or partner, 6.Public invalidity or incapacity pension, 7.War pension, 8.Private (occupational) old age pension, 9.Private (occupational) early retirement pension, 10.Private (occupational) disability or invalidity insurance, 11.Private (occupational) survivor pension from your spouse or partner's job, 96.None of these." For each received pension type, the respondent was then asked, "Before taxes, about how large was the average payment in 2003?" The respondent was then asked "What period did that payment cover?" with the following answer options: One week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, other(specify). Next, the respondent was asked, "For how many months altogether did you receive [income source] in 2003?" Starting in Wave 2, the survey asked, "Have you received income from any of these sources in [previous year]?" and presented the respondent with the following show card: "1.Public old age pension, 2.Public old age supplementary pension or public old age second pension, 3.Public early retirement or pre-retirement pension, 4.Main public disability insurance pension, or sickness benefits, 5.Secondary public

disability insurance pension, or sickness benefits, 6.Public unemployment benefit or insurance, 7.Main public survivor pension from your spouse or partner, 8.Secondary public survivor pension from your spouse or partner, 9.Public war pension, 10.Public long-term care insurance, 96. None of these." For each received pension type, the respondent was then asked, "After taxes, about how large was a typical payment in [previous year]?" and "What period did that payment cover?" with the filling answer options: One week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, other(specify). Next, the respondent was asked, "For how many months altogether did you receive [income source] in [previous year]?"

Starting in Wave 6, the survey asked, "Have you received income from any of these sources in [previous year]?" and presented the respondent with the following show card: "1.Public old age pension, 2.Public old age supplementary pension or public old age second pension, 3.Public early retirement or pre-retirement pension, 4.Main public sickness benefits, 5.Main public disability insurance pension, 6.Secondary public disability insurance pension, 7.Secondary public sickness benefits, 8.Public unemployment benefit or insurance, 9.Main public survivor pension from your spouse or partner, 10.Secondary public survivor pension from your spouse or partner, 11.Public war pension, 12.Public long-term care insurance, 13.Social assistance, 96.None of these." For each received pension type, the respondent was then asked, "After taxes, about how large was a typical payment in [previous year]?" and "What period did that payment cover?" with the filling answer options: One week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, other(specify). Next, the respondent was asked, "For how many months altogether did you receive [income source] in [previous year]?" As is clear, ownership of all types of pensions were asked together in Wave 1, while in Wave 2 and forward, ownership of public types of pensions were asked separately from ownership of occupational pensions. Also note that the categories changed between Wave 1 and Wave 2, and between Wave 2 and Wave 6. After asking about the period over which benefits were received (e.g., whether weekly or monthly), respondents in Wave 1 were asked the "average payment", whereas in Wave 2 and forward, they were asked the "typical payment".

For **rWitgxfr** and **sWitgxfr** in Waves 2 and onward, income from government transfers includes payments for public unemployment benefits or insurance and for public long-term care insurance. Starting in Wave 6, **rWitgxfr** and **sWitgxfr** also include social assistance. In the survey, social assistance is defined as "cash or voucher programmes meant to provide a general 'safety net', guaranteeing minimum resources to those otherwise lacking resources from either employment or contributory based social security benefits/pensions".

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not answer this question.

Cross-Study Differences with the HRS

Unlike SHARE, the HRS consistently elicits before-tax income. The HRS however, provides tax liability data for 2000 and 2002 (Rohwedder et al., 2005). The method used to generate those data can also be used to generate tax liability data for other years. However, this only gives total tax liability, from which total after tax income can be computed, but not after tax income per income component.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Income measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All income measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When an income component is missing it is imputed. We refer to the section “Missing Values, Nonresponse, and Imputations” earlier in this document for more details.

How Constructed

Other income is elicited in the employment and pensions (EP) module for all respondents. In all countries the EP module asks the respondent whether they received any income from alimony and regular payments from charities. If the respondent reports receiving any specific type of payment, then they are asked how large the average payment in the previous year was and what period of time the payment covered: one week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, or other. The respondent is finally asked how many months altogether was the payment received in the previous year.

rWiothr is the value of the respondent's other income in the previous year, before any tax and contributions. **rWiothr** is based on SHARE derived variables which compute annual payment income by multiplying the respondent's reported per-period (e.g., monthly) payment by the reported number of periods (months) during which it was received. SHARE derived variables include imputations for missing values. **rWifothr** is the imputation flag indicating whether the value of **rWiothr** was imputed or not. The SHARE imputations file provides imputation flags for the annual amount, but it does not include the periodicity or its imputation status as separate variables from the pay-period amount. We treat the imputation flags for annual amounts as if they were imputation flags for pay-period amounts, implicitly assuming that the periodicity was not imputed. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWiothr is the value of the respondent's spouse's other income in the previous year, before any tax and contributions and is taken directly from the spouse's value for **rWiothr**. **sWifothr** indicates whether the value of **sWiothr** was imputed or not and is based on the respondent's spouse's value for **rWifothr**. **sWiothr** and **sWifothr** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWitothr is the value of the respondent's other income in the previous year, after any tax and contributions. **rWitothr** is based on SHARE derived variables which compute annual payment income by multiplying the respondent's reported per-period (e.g., monthly) payment by the reported number of periods (months) during which it was received. SHARE de-

rived variables include imputations for missing values. **rWitfothr** is the imputation flag indicating whether the value of **rWitothr** was imputed or not. The SHARE imputations file provides imputation flags for the annual amount, but it does not include the periodicity or its imputation status as separate variables from the pay-period amount. We treat the imputation flags for annual amounts as if they were imputation flags for pay-period amounts, implicitly assuming that the periodicity was not imputed. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWitothr is the value of the respondent's spouse's other income in the previous year, after any tax and contributions and is taken directly from the spouse's value for **rWitothr**. **sWitfothr** indicates whether the value of **sWitothr** was imputed or not and is based on the respondent's spouse's value for **rWitfothr**. **sWitothr** and **sWitfothr** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 1, income is asked before taxes and contributions, whereas from Wave 2 onward it is asked after taxes and contributions. (In Austria, "and Contributions" was omitted.) This is indicated by different variable names. Specifically, for before tax measures we use the structure **rWi***, **sWi***, and **hWi***, while, for after tax measures, we use the structure **rWit***, **sWit***, and **hWit*** with the letter 't' denoting "after tax".

Pension systems, government transfer programs, etc., differ considerably across SHARE countries. Despite the effort of the SHARE teams to harmonize questionnaires, there appear to be many differences across countries justified by specific institutional frameworks. The SHARE website provides a list of known differences here: <https://share-eric.eu/data/data-documentation/questionnaires/country-specific-deviations>.

In addition to significant cross-country differences, the regular payments question wording changed significantly between Wave 1 and Wave 2. In Wave 1, the survey asked the respondent, "Did you receive any of the following regular payments or transfers during the year 2003?" and presented the respondent with the following show card: "1.Life insurance payment, 2.Private annuity/private personal pension, 3.Private health insurance payment, 4.Alimony, 5.Regular payments from charities, 96.None of these." For each regular payment the respondent answered that they received, the respondent was then asked, "Before any taxes and contributions, about how large was the average payment in 2003?" The respondent was then asked, "What period did that payment cover?" with the following answer options: One week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, other(specify). Next, the respondent was asked, "For how many months altogether did you receive [income source] in 2003?" Starting in Wave 2, the survey asked, "Did you receive any of the following regular payments or transfers during [previous year]?" and presented the respondent with the following show card: "1.Regular life insurance payments, 2.Regular private annuity or private personal pension payments, 3.Alimony, 4.Regular payments from charities, 5.Long-term care insurance payments from a private insurance company, 96.None of these." For each regular payment the respondent answered that they received, the respondent was then asked, "After any taxes and contributions, about how large was the average payment in [previous year]?" The respondent was then asked, "What period did that payment cover?" with the following answer options: One week, two weeks, calendar month/4 weeks, three months/13 weeks, six months/26 weeks, full year/12 months/52 weeks, other(specify). Next, the respondent was asked, "For how many months altogether did you receive [income source] in [previous year]?" It is clear that other regular payments categories changed between Wave 1 and Wave 2. Also note that private long-term care insurance payments were not included in the Wave 1 regular payment question, whereas they were included with the Wave 2 and forward.

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not answer this question.

Cross-Study Differences with the HRS

Section F. Income and Consumption

Unlike SHARE, the HRS consistently elicits before-tax income. The HRS however, provides tax liability data for 2000 and 2002 (Rohwedder et al., 2005). The method used to generate those data can also be used to generate tax liability data for other years. However, this only gives total tax liability, from which total after tax income can be computed, but not after tax income per income component.

The corresponding RAND HRS variable includes lump sum income from insurance, pension, or inheritance. Even though lump sums from health/long-term insurance, alimony, and charities are asked in the SHARE questionnaire, they are not included in the Wave 1 and Wave 2 imputations files. Thus, these lump sums are excluded from the Gateway Harmonized SHARE variables **rWiothr**, **sWiothr**, **rWitotr**, and **sWitotr**.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Income measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All income measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When an income component is missing it is imputed. We refer to the section “Missing Values, Nonresponse, and Imputations” earlier in this document for more details.

How Constructed

In the housing (HO) module, the household respondent reports income of other household members on behalf of the whole household. The HO module asks the respondent whether there was any household member who contributed to household income but was not part of the interview. If this was the case, then the respondent was asked to report the amount of income contributed by other household members. Next, the respondent is asked whether anyone in the household received income from other sources, like housing allowances, child benefits, poverty relief etc. and, if yes, how much these benefits amounted to. All imputed values of HO module variables are provided at the household-level.

hhWiothhh is the value of all other household members' income in the previous year, before any tax and contributions. **hhWiothhh** is based on SHARE derived variables which include imputations for missing values. **hhWifothhh** is the imputation flag indicating whether the value of **hhWiothhh** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWitothhh is the value of all other household members' income in the previous year, after any tax and contributions. **hhWitothhh** is based on SHARE derived variables which include imputations for missing values. **hhWitfothhh** is the imputation flag indicating whether the value of **hhWitothhh** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this income and, therefore, the corresponding value was set to 0. A code of 7 indicates that both income ownership and amount were imputed. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In Wave 1, income is asked before taxes and contributions, whereas from Wave 2 onward it is asked after taxes and contributions. (In Austria, "and Contributions" was omitted.) This is indicated by different variable names. Specifically, for before tax measures we use the structure **rWi***, **sWi***, and **hWi***, while, for after tax measures, we use the structure **rWit***, **sWit***, and **hWit*** with the letter 't' denoting "after tax".

In Wave 1 and Wave 2, only one household respondent is allowed to answer the HO module. In Wave 4 and forward, multiple household respondents can complete the HO module but the imputations are only based on one of those respondents' answers.

The wording of the question eliciting income of other household members changed slightly between Wave 1 and Wave 2, and again in Wave 6. In Wave 1, the survey asked, "Although we may have asked you [or other members of your household] some of the details earlier, it is important for us to understand your household's situation correctly. In the last year, that is in 2003, was there any household member who contributed to your household income and who is not part of this interview?" followed by the question, "Can you give us the approximate total amount of income received in 2003 by other household members before any taxes or contributions?" Next, the survey asked, "Some households receive payments such as housing allowances, child benefits, poverty relief etc. Has your household or anyone in your household received any such payments in 2003?" followed by the question, "Please give us the approximate total amount of income from these benefits that you received as a household in 2003, before any taxes and contributions." From Wave 2 through 5, the survey asked, "Although we may have asked you [or other members of your household/empty] some of the details earlier, it is important for us to understand your household's situation correctly. In the last year, that is in [previous year], was there any household member who contributed to your household income and who is not part of this interview?" followed by the question, "Can you give us the approximate total amount of income received in [previous year] by other household members after any taxes or contributions?" Next, the survey asked, "Some households receive payments such as housing allowances, child benefits, poverty relief etc. Has your household or anyone in your household received any such payments in [previous year]?" followed by the question, "Please give us the approximate total amount of income from these benefits that you received as a household in [previous year], after any taxes and contributions."

In Wave 6 and onward, the survey asked, "Although we may have asked you [or other members of your household/empty] some of the details earlier, it is important for us to understand your household's situation correctly. In the last year, that is in [previous year], was there any household member who contributed to your household income and who is not part of this interview?", unlike in previous waves, though, SHARE did not ask for the approximate total amount of income earned by other household members. This question was still followed by, "Some households receive payments such as housing allowances, child benefits, poverty relief etc. Has your household or anyone in your household received any such payments in [previous year]?" followed by the question, "Please give us the approximate total amount of income from these benefits that you received as a household in [previous year], after any taxes and contributions." Hence, in Wave 1 the survey elicits pre-tax income, while it elicits post-tax income from Wave 2 onward. Also, while the survey collects the approximate amount of income earned by other household members in Waves 1 to 5, it does not do so starting in Wave 6. Because this information is not collected starting in Wave 6, **hhWitothhh** and **hhWitfothhh** are not available in these waves because it is not compatible with previous waves.

Cross-Study Differences with the HRS

Unlike SHARE, the HRS consistently elicits before-tax income. The HRS however, provides tax liability data for 2000 and 2002 (Rohwedder et al., 2005). The method used to generate those data can also be used to generate tax liability data for other years. However, this only gives total tax liability, from which total after tax income can be computed, but not after tax income per income component.

Other household member's income is not included as part of the RAND HRS.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Income measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All income measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When an income component is missing it is imputed. We refer to the section “Missing Values, Nonresponse, and Imputations” earlier in this document for more details.

How Constructed

hWitot is the sum of all income, before any taxes and contributions, at the couple-level economic unit (the respondent and spouse, if any). That is, the sum of **rWlearn**, **rWipena**, **rWipubpen**, **rWigxfr**, **rWiothr** for both the respondent and spouse, if any, plus **hWicap**. A special missing value (.n) indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A special missing value (.s) indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide imputations for non-responding spouses. A special missing value (.i) indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). **hWiftot** is a flag indicating the highest level of imputation of the components of **hWitot**. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3 indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -2 indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide imputations for non-responding spouses. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWitot is the sum of all income, before any taxes and contributions, at the household-level (all respondents in the household). Instead of being the sum of all previous income components, **hhWitot** is taken directly from the single SHARE imputed variable **thinc**, as this variable includes SHARE's only imputations for non-responding spouses. As SHARE does not provide imputations for non-responding spouses in the individual income component variables, using this one value is preferable to adding all existing income components variables. **hhWiftot** is a flag indicating whether any components of **hhWitot**

were imputed. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3 indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -2 indicates that household income was created by imputing income for a non-responding spouse. A code of -3 indicates that household income was created by imputing income components from the HO module for an institutionalized respondent. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hWittot is the sum of all income, after any taxes and contributions, at the couple-level economic unit (the respondent and spouse, if any). That is, the sum of **rWitearn**, **rWitpena**, **rWitpubpen**, **rWitgxfr**, **rWitothr** for both the respondent and spouse, if any, plus **hWitcap**. A special missing value (.n) indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A special missing value (.s) indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide imputations for non-responding spouses. **hWitot** is assigned special missing value (.m) if any of its components have a special missing value (.m). **hWitftot** is a flag indicating the highest level of imputation of the components of **hWittot**. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3 indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -2 indicates that the value is missing because the respondent's spouse was non-responding and SHARE does not provide imputations for non-responding spouses. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWittot is the sum of all income, after any taxes and contributions, at the household-level (all respondents in the household). Instead of being the sum of all previous income components, **hhWittot** is taken directly from the single SHARE imputed variable **thinc**, as this variable includes SHARE's only imputations for non-responding spouses. As SHARE does not provide imputations for non-responding spouses in the individual income component variables, using this one value is preferable to adding all existing income components variables. **hhWitftot** is a flag indicating whether any components of **hhWittot** were imputed. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3 indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. A code of -1 indicates that the value is missing because, at the time of the interview, the household included additional survey participants beyond the respondent and their spouse/partner. A code of -2 indicates that household income was created by imputing income for a non-responding spouse. A code of -3 indicates that household income was created by imputing income components from the HO module for an institutionalized respondent. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

hhWitothhinc is the value of the total household income, excluding taxes and contributions, as reported through a single direct question in the household income module (HH). This question is asked starting in Wave 2. The answers to this direct question may be different from the aggregated total household income value captured in **hhWittot**. **hhWitothhinc** is based on a SHARE derived variable which includes imputations for missing values. **hhWiftothhinc** is the imputation flag indicating whether the value of **hhWitothhinc** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized

respondents). Responses are set to blank missing (.) when the respondent does not participate in the current wave.

Cross Wave Differences in SHARE

See components.

Because **hhWitot** is not available starting in Wave 6, **hhWittot** and **hhWitftot** cannot be calculated and so are not available in these waves. Please see the 'Income from Other Household Members' section for additional information.

hhWitot is available starting in Wave 2.

Cross-Study Differences with the HRS

Unlike SHARE, the HRS consistently elicits before-tax income. The HRS however, provides tax liability data for 2000 and 2002 (Rohwedder et al., 2005). The method used to generate those data can also be used to generate tax liability data for other years. However, this only gives total tax liability, from which total after tax income can be computed, but not after tax income per income component.

We refer to the definition of the single components for component-specific differences between Gateway Harmonized SHARE and RAND HRS.

hhWitot is not available in the RAND HRS.

All financial values in RAND HRS are given in nominal dollars, while those in Gateway Harmonized SHARE are given in nominal Euro. Conversion to a common currency will be necessary before comparison of this data.

General Comments:

Income measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All income measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When an income component is missing it is imputed. We refer to the section “Missing Values, Nonresponse, and Imputations” earlier in this document for more details.

How Constructed

For all waves, imputed consumption is provided at the household-level.

hhWcfoodi1m represents the typical monthly amount spent by the household on food consumed at home in Euros. The household respondent is asked, "Thinking about the last 12 months: about how much did your household spend in a typical month on food to be consumed at home?" Starting in Wave 2, the household respondent is asked, "Do you [and other members of your household] consume vegetables, fruit or meat that you have grown, produced, caught or gathered yourselves?" If the household respondent says yes, then they are asked, "What is the value of the home produced food that you consumed in a typical month during the last year? In other words, how much would you have paid for this food if you had to buy it?" As such, starting in Wave 2, if the household respondent reports eating food produced at home, the value of that food is added to the value of purchased food consumed at home. **hhWcfoodi1m** is based on SHARE derived variables which include imputations for missing values. **hhWcffoodi1m** is the imputation flag indicating whether the value of **hhWcfoodi1m** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code of 6 indicates that the respondent reported not having this consumption and, therefore, the corresponding value was set to 0. A code of 7 indicates that both whether consumed and amount were imputed. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent does not participate in the current wave.

hhWcfoodo1m represents the typical monthly amount spent by the household on food consumed outside of the home in Euros. The respondent is asked, "Still thinking about the last 12 months: about how much did your household spend in a typical month on food to be consumed outside home?" **hhWcfoodo1m** is based on SHARE derived variables which include imputations for missing values. **hhWcffoodo1m** is the imputation flag indicating whether the value of **hhWcfoodo1m** was imputed or not. A code of 1 indicates the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. A code

of 6 indicates that the respondent reported not having this consumption and, therefore, the corresponding value was set to 0. A code of 7 indicates that both whether consumed and amount were imputed. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent does not participate in the current wave.

hhWcfood1m is a summary variable representing the total typical monthly amount spent by the household on food consumption in Euros. **hhWcfood1m** is defined as: **hhWcfoodi1m** + **hhWcfoodo1m**. **hhWcfood1m** is a flag indicating whether the values of **hhWcfoodi1m** or **hhWcfoodo1m** were imputed. A code of 1 indicates the respondent reported continuous values for all components and no imputation was necessary. A code of 2 indicates that at least one component was imputed based on a complete bracket. A code of 3 indicates that at least one component was imputed based on an incomplete bracket. A code of 5 indicates that at least one component was imputed without any bracket information. A code of 6 indicates the respondent reported not having any of the components and the value is 0. A code of 7 indicates that, at least for one component, both income ownership and amounts were imputed. A code of -3 indicates that the value is missing because the respondent was in an institution at the time of the interview (SHARE does not provide imputations of HO module variables for institutionalized respondents). Responses are set to blank missing (.) when the respondent does not participate in the current wave.

Cross Wave Differences in SHARE

Amount spent on purchased food consumed within the home is asked at each wave. The value of food produced and consumed at home is asked starting in Wave 2. Therefore, in Wave 1 **hhWcfoodi1m** is equal to the amount spent on purchased food consumed within the home. Starting in Wave 2, **hhWcfoodi1m** is equal to the sum of the amount spent on purchased food consumed within the home and the value of food produced and consumed at home. Starting in Wave 4, if the respondent refuses or does not know the value, a series of unfolding bracket questions are asked.

Amount spent on food consumed out of the house or on takeaways is asked at each wave. Starting in Wave 4, if the respondent refuses or does not know the value, a series of unfolding bracket questions are asked.

Cross-Study Differences with the HRS

The HRS asks the amount spent on food used at home, the amount spent on food delivered to the door, and the amount spent eating out in an average week. Comparable variables have not yet been created in the RAND HRS or Harmonized HRS but could be created using the HRS data.

Total Consumption

Variable	Waves	Label	Type
hhWctot1m	1	hhWctot1m:ww hhold monthly total consumption	Cont

General Comments:

Income measures are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, and Hungary where local currencies are used and in Estonia until 2011 when it switched to the Euro. All income measures are denominated in nominal Euros and have been converted by the SHARE team when necessary.

When an income component is missing it is imputed. We refer to the section “Missing Values, Nonresponse, and Imputations” earlier in this document for more details.

How Constructed

hhWctot1m represents the total typical monthly amount spent by the household in Euros. The household respondent is asked, "Thinking about the last 12 months: about how much did your household spend in a typical month on all goods and services, including groceries, eating out, telephone and everything else?" Don't know, refuse, and other missing responses of **hhWctot1m** are assigned special missing codes (.d), (.r), (.m), respectively. **hhWctot1m** is set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

hhWctot is only available for Wave 1. This question is not asked starting in Wave 2.

Cross-Study Differences with the HRS

The HRS does not have an equivalent variable.

Continuous Variable Distributions

Variable	N	Mean	Std.Dev	Minimum	Maximum	Total missing
hh1ctot1m	16,461	1,690.80	36,808.59	0.00	4,384,555.50	13,955

G. Family Structure

Number of People Living in Household

Variable	Waves	Label	Type
hhWhhres	1-2, 4-9	hhWhhres:ww Number of people in HH	Cont

How Constructed

hhWhhres counts the number of people living in the household, including the respondent(s).

The number of residents living in a household is obtained using the Coverscreen Module, which includes all members reported to live in the household, as identified by the household respondent, whether or not they are eligible in SHARE. The household respondent can be identified using the variable **rWhhr**.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

No differences known.

Number of Children

Variable	Waves	Label	Type
hWson	1-2, 4-9	hWson:ww Number of living sons R/P	Cont
hWdau	1-2, 4-9	hWdau:ww Number of living daughters R/P	Cont
hWchild	1-2, 4-9	hWchild:ww Number of living children R/P	Cont
hWfchild	1-2, 4-9	hWfchild:ww Impute Flag Num of living children	Categ

How Constructed

The SHARE asks the family respondent to count all living children who are either natural, foster, adopted, or stepchildren of theirs and/or their partner. The SHARE provides a derived version of this variable with imputed values for those respondents for whom the number of living children is missing.

hWson and **hWdau** provides the number of livings sons and daughters, respectively, of the respondent and their spouse or partner. **hWchild** provides the number of living children of the respondent and their spouse or partner. **hWchild** includes imputed values. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked this question and are assigned special missing value (.c). Don't know, refuse, and other missing responses for **hWson**, **hWdau**, and **hWchild** are coded as (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) for respondents who did not participate in the current wave.

hWfchild indicates whether the number of living children was imputed. A code of 1 indicates the value of **hWchild** was imputed. A code of 0 indicates the value was not imputed. Missing responses for **hWfchild** are coded as special missing (.m). Responses are set to blank missing (.) for respondents who did not participate in the current wave.

Cross Wave Differences in SHARE

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked about their children.

Cross-Study Differences with the HRS

Unlike the HRS, the SHARE explicitly asks respondents to include foster children in their count of living children. The RAND HRS also does not impute the number of living children when missing.

Number of Grandchildren

Variable	Waves	Label	Type
hWgrchild	1-2, 4-9	hWgrchild:ww Number of grandchildren R/P	Cont
hWfgrchild	1-2, 4-9	hWfgrchild:ww Impute Flag Num of grandchildren	Categ

How Constructed

hWgrchild provides the number of grandchildren of the respondent and their spouse or partner. The SHARE provides a derived version of this variable with imputed values for those respondents for whom the number of living grandchildren is missing.

In Waves 1 and 2, if the family respondent reported that they and their partner had more than one living child, then the SHARE asks the respondent how many grandchildren they and their spouse/partner have altogether. SHARE includes an interviewer note telling respondents to include grandchildren of the spouse/partner from previous relationships. Starting in Wave 4, the family respondent is asked about the number of grandchildren regardless of whether they have a living child. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked this question and are assigned special missing value (.c). Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

hWfgrchild indicates whether the number of grandchildren was imputed. A code of 1 indicates the value of **hWgrchild** was imputed. A code of 0 indicates the value was not imputed. Missing responses to **hWfgrchild** are set to special missing (.m). Responses are set to blank missing (.) when the respondent does not participate in the current wave.

Cross Wave Differences in SHARE

In Waves 1 and 2, respondents must have a living child in order to respond to the number of grandchildren. Starting in Wave 4, respondents do not need to have a living child in order to respond to the number of grandchildren.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview) were asked about their grandchildren.

Cross-Study Differences with the HRS

Number of grandchildren is provided in the Harmonized HRS, and the RAND HRS Family Data also includes the variable **kwgkids**, which records the number of grandchildren for each child.

sWlivsib	1-2, 4-9	sWlivsib:WW s Number of living siblings	Cont

How Constructed

rWlivbro and **rWlivsis** count the number of the respondent's living brothers and sisters, respectively. **rWlivsib** is the number of the respondent's living siblings, that is, the sum of **rWlivbro** and **rWlivsis**. At each wave, all SHARE participants are asked to report the number of their living brothers and sisters. Don't know, refuse and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWlivbro, **sWlivsis**, and **sWlivsib** are the number of the spouse's brothers, sisters, and siblings, respectively. They are taken from the spouse's **rWlivbro**, **rWlivsis**, and **rWlivsib**, respectively. In addition to the special missing values used by **rWlivbro**, **rWlivsis**, and **rWlivsib**, **sWlivbro**, **sWlivsis**, and **sWlivsib** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

In Waves 1, 2H, 3H, 4, and 5, of the HRS, this information is provided by the Family Respondent. In all other HRS Waves, each respondent reports the number of their living siblings. This is also the way this information is collected by the SHARE in all of its waves.

Parental Mortality: Mother Alive

Variable	Waves	Label	Type
rWmomliv	1-2, 4-9	rWmomliv:WW r mother alive	Categ
sWmomliv	1-2, 4-9	sWmomliv:WW s mother alive	Categ

How Constructed

rWmomliv indicates whether the respondent's mother is alive at the current wave. A code of 0 indicates that the respondent's mother is not alive at the current wave; a code of 1 indicates that the respondent's mother is alive at the current wave. If the respondent reports that their mother is deceased, then that answer is carried forward to subsequent waves. In Wave 4, baseline respondents are not asked whether their mother is alive or deceased, so these respondents are assigned a special missing (.b). When respondents don't know, refuse to answer, or are otherwise missing, **rWmomliv** is assigned special missing values (.d), (.r), or (.m), respectively. **rWmomliv** is set to plain missing (.) for respondents who did not respond to the current wave.

sWmomliv indicates whether the current wave's spouse's mother is alive at the current wave. It is taken from the spouse's **rWmomliv**. In addition to the special missing codes used by **rWmomliv**, **sWmomliv** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

After the baseline interview, SHARE only asks respondents about their mother if the respondent has not already reported that their mother died in an earlier wave. Previous reports of a deceased mother are fed-forward in **rWmomliv**.

Coverscreen data was not released for Israel in Wave 2, resulting in a high number of special missing (.m) values in this wave.

In Wave 4, SHARE only asks respondents whether their mother is still alive if the mother was not already identified in the household roster or was already mentioned in the Social Network module. Wave 4 baseline respondents whose mother was not living in the household and who did not identify their mother in the Social Network module were not asked whether their mother is still alive. These respondents have been assigned special missing value (.b) in **r4momliv**.

In Waves 5 and 7, SHARE did not have a Social Network module. The only respondents who were not asked whether their mother was alive were respondents who previously reported their mother had died or whose mother was already identified in the household roster.

Cross-Study Differences with the HRS

No differences known.

Parental Mortality: Father Alive

Variable	Waves	Label	Type
rWdadliv	1-2, 4-9	rWdadliv:WW r father alive	Categ
sWdadliv	1-2, 4-9	sWdadliv:WW s father alive	Categ

How Constructed

rWdadliv indicates whether the respondent's father is alive at the current wave. A code of 0 indicates that the respondent's father is not alive at the current wave; a code of 1 indicates that the respondent's father is alive at the current wave. If the respondent reports that their father is deceased, then that answer is carried forward to subsequent waves. In Wave 4, baseline respondents are not asked whether their father is alive or deceased, so these respondents are assigned a special missing (.b). When respondents don't know, refuse to answer, or are otherwise missing, **rWdadliv** is assigned special missing values (.d), (.r), or (.m), respectively. **rWdadliv** is set to plain missing (.) for respondents who did not respond to the current wave.

sWdadliv indicates whether the current wave's spouse's father is alive at the current wave. It is taken from the spouse's **rWdadliv**. In addition to the special missing codes used by **rWdadliv**, **sWdadliv** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

After the baseline interview SHARE only asks respondents about their father if the respondent has not already reported that their father died in an earlier wave. Previous reports of a deceased father are fed-forward in **rWdadliv**.

Coverscreen data was not released for Israel in Wave 2, resulting in a high number of special missing (.m) values in this wave.

In Wave 4, SHARE only asks respondents whether their father is still alive if the father was not already identified in the household roster or was already mentioned in the Social Network module. Wave 4 baseline respondents whose father was not living in the household and who did not identify their father in the Social Network module were not asked whether their father is still alive. These respondents have been assigned special missing value (.b) in **r4dadliv**.

In Waves 5 and 7, SHARE did not have a Social Network module. The only respondents who were not asked whether their father was alive were respondents who previously reported their father had died or whose father was already identified in the household roster.

Parental Mortality: Mother's Current Age or Age at Death

Variable	Waves	Label	Type
rWmomage	1-2, 4-9	rWmomage:wW r mother age current/at death	Cont
sWmomage	1-2, 4-9	sWmomage:wW s mother age current/at death	Cont

How Constructed

rWmomage is the respondent's mother's current age in years, if she is still alive, or the respondent's mother's age at death, if she has died. In Wave 2 and forward, if the respondent's mother's current age is missing but the respondent reports their mother being alive in the previous and current waves and there is a value for the mother's current age in a previous wave, then 2 years are added for each wave between the present wave and the wave with the latest report of mother's current age, to the mother's most recently reported current age. In Wave 4, baseline respondents were not asked about their mother's current age or age at death, so these respondents are assigned special missing (.b). Don't know, refuse, and missing responses to **rWmomage** are set to special missing (.d), (.r), and (.m), respectively. **rWmomage** is set to plain missing (.) for respondents who did not respond to the current wave.

sWmomage is the current wave's spouse's mother's current age or age at death. It is taken from the spouse's **rWmomage**. In addition to the special missing codes used by **rWmomage**, **sWmomage** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

After the baseline interview, SHARE only asks respondents about their mother if the respondent has not already reported that their mother died in an earlier wave. Previous reports of the age of death are fed-forward in **rWmomage**.

Coverscreen data was not released for Israel in Wave 2, resulting in a high number of special missing (.m) values in this wave.

In Wave 4, SHARE only asks respondents about their mother's age or age at death if the mother was not already identified in the household roster or was not already mentioned in the Social Network module. Wave 4 baseline respondents whose mother was not living in the household and who did not identify their mother in the Social Network module were not asked about their mother's age or age at death. These respondents have been assigned special missing value (.b) in **r4momage**.

In Waves 5 and 7, SHARE did not have a Social Network module. The only respondents who were not asked about their mother's age or age at death were respondents who previously reported their mother had died or whose mother was already identified in the household roster.

Parental Mortality: Father's Current Age or Age at Death

Variable	Waves	Label	Type
rWdadage	1-2, 4-9	rWdadage:wW r father age current/at death	Cont
sWdadage	1-2, 4-9	sWdadage:wW s father age current/at death	Cont

How Constructed

rWdadage is the respondent's father's current age in years, if he is still alive, or the respondent's father's age at death, if he has died. In Wave 2 and forward, if the respondent's father's current age is missing but the respondent reports their father being alive in the previous and current waves and there is a value for the father's current age in a previous wave, then 2 years are added for each wave between the present wave and the wave with the latest report of father's current age, to the father's most recently reported current age. In Wave 4, baseline respondents were not asked about their father's current age or age at death, so these respondents are assigned special missing (.b). Don't know, refuse, and missing responses to **rWdadage** are set to special missing (.d), (.r), and (.m), respectively. **rWdadage** is set to plain missing (.) for respondents who did not respond to the current wave.

sWdadage is the current wave's spouse's father's current age or age at death. It is taken from the spouse's **rWdadage**. In addition to the special missing codes used by **rWdadage**, **sWdadage** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

After the baseline interview, SHARE only asks respondents about their father if the respondent has not already reported that their father died in an earlier wave. Previous reports of the age of death are fed-forward in **rWdadage**.

Coverscreen data was not released for Israel in Wave 2, resulting in a high number of special missing (.m) values in this wave.

In Wave 4, SHARE only asks respondents about their father's age or age at death if the father was not already identified in the household roster or was not already mentioned in the Social Network module. Wave 4 baseline respondents whose father was not living in the household and who did not identify their father in the Social Network module were not asked about their father's age or age at death. These respondents have been assigned special missing value (.b) in **r4dadage**.

In Waves 5 and 7, SHARE did not have a Social Network module. The only respondents who were not asked about their father's age or age at death were respondents who previously reported their father had died or whose father was already identified in the household roster.

Cross-Study Differences with the HRS

No differences known.

Number of Living Parents

Variable	Waves	Label	Type
rWlivpar	1-2, 4-9	rWlivpar:wW r Number of living parents	Cont
sWlivpar	1-2, 4-9	sWlivpar:wW s Number of living parents	Cont

How Constructed

rWlivpar records the number of the respondent's living parents. It is derived by summing the variables **rWmomliv** and **rWdadliv**. If either **rWmomliv** or **rWdadliv** is missing, then **rWlivpar** is missing. In Wave 4, baseline respondents who did not report their mother or father in the household roster or Social Network module were not asked whether their mother and father were living, and so these respondents are assigned special missing (.b). Don't know, refuse, and other missing values of **rWlivpar** are assigned (.d), (.r), and (.m), respectively. **rWlivpar** is set to blank missing (.) when respondents did not participate in the current wave.

sWlivpar records the number of living parents of the respondent's spouse in the current wave. It is taken from the spouse's **rWlivpar**. In addition to the special missing codes used by **rWlivpar**, **sWlivpar** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Refer to the "Cross Wave Differences in SHARE" section of each component to identify differences between waves.

Any Child Co-Resides, Lives Near Respondent

Variable	Waves	Label	Type
hWcoresd	1-2, 4-9	hWcoresd:WW any child coresides with R/P	Categ
hWlvnear	1-2, 4-9	hWlvnear:WW any child lives within 30 min	Categ

How Constructed

The SHARE asks the family respondent to count all living children who are either natural, foster, adopted, or stepchildren of theirs and/or their partner.

hWcoresd indicates whether any child is co-residing with the respondent and their spouse or partner. **hWcoresd** is coded as 1 if the respondent reported that any child co-resides with the respondent or spouse. Otherwise, **hWcoresd** is coded as 0. Special missing code (.k) is assigned if the respondent reports not having any living children. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked this question and are assigned special missing value (.c). Don't know, refuse, and other missing responses for **hWcoresd** are coded as (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) for respondents who did not participate in the current wave.

hWlvnear indicates whether any child lives within approximately 30 minutes of the respondent and their spouse or partner. **hWlvnear** is coded as 1 if the respondent reports one or more children living in the same household, in the same building, less than 1 kilometer away, between 1 and 5 kilometers away, or between 5 and 25 kilometers away. Otherwise, **hWlvnear** is coded as 0. Special missing code (.k) is assigned if the respondent reports not having any living children. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked this question and are assigned special missing value (.c). Don't know, refuse, and other missing responses for **hWlvnear** are coded as (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) for respondents who did not participate in the current wave.

Cross Wave Differences in SHARE

In Waves 1, 2, 5, and 7, the information used to derive these variables is only from information about children provided by the family respondent. However, in Waves 4, 6, 8, and 9, these variables are constructed from information about children provided by the family respondent, as well as information from the Social Network module.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked about their children.

Cross-Study Differences with the HRS

This variable is not available in RAND HRS but is available in RAND Family data.

Contact with Children in Person, by Phone or Mail

Variable	Waves	Label	Type
hWkcnt	1-2, 4-9	hWkcnt:ww any weekly contact with children in person/phone/mail	Categ
hWkcnt1m	1-2, 4-9	hWkcnt1m:ww any monthly contact with children in person/phone/mail	Categ
hWkcntfr	1-2, 4-9	hWkcntfr:ww frequency contact with children in person/phone/mail	Categ

How Constructed

The family respondent is asked about the frequency of contact with each of their children either in person, by phone, mail, e-mail, sms or mms. Respondents can report contact using the following categories: daily, several times a week, about once a week, about every two weeks, about once a month, less than once a month, never. Weekly contact is defined as the respondent contacting their children at least once a week. Monthly contact is defined as the respondent contacting their children at least once a month.

hWkcnt indicates whether the family respondent and their spouse have any frequent (i.e., at least weekly) contact with any of their children in person, by phone, mail, e-mail, sms or mms. A code of 1 is used if the respondent reports any contact either daily, several times a week, or about once a week. A code of 1 is also used if the family respondent reported co-residing with any child. A code of 0 is used if the respondent did not report any weekly in-person contact. **hWkcnt1m** indicates whether the family respondent and their spouse have at least monthly contact with any of their children in person, by phone, mail, e-mail, sms or mms. A code of 1 is used if the respondent reports any contact either daily, several times a week, about once a week, about every two weeks, or about once a month. A code of 1 is also used if the family respondent reported co-residing with any child. A code of 0 is used if the respondent did not report any monthly in-person contact. If the respondent and spouse don't have any living children, a special missing value (.k) is assigned. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked these questions and are assigned special missing value (.c). Don't know, refused, or other missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) for respondents who did not participate in the current wave.

hWkcntfr indicates the frequency with which the family respondent and their spouse have contact with any of their children in person, by phone, mail, e-mail, sms or mms. If a couple or respondent has more than one child, the highest frequency of contact with any child is reported. **hWkcntfr** is coded as follows: 1.Daily, 2.Several times a week, 3.About once a week, 4.About every two weeks, 5.About once a month, 6.Less than once a month, and 7.Never. If the respondent and spouse don't have any living children, a special missing value (.k) is assigned. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked these questions and are assigned special missing value (.c). Don't know, refused, or other missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) for respondents who did not participate in the current wave.

Cross Wave Differences in SHARE

In Waves 1, 2, 5, and 7, the information used to derive these variables is only from information about children provided by the family respondent. However, in Waves 4, 6, 8, and 9, these variables are constructed from information about children provided by the family respondent, as well as information from the Social Network module.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked about their children.

Cross-Study Differences with the HRS

The Harmonized HRS includes **hWkcnt**, indicating whether the respondent and/or their spouse have weekly contact with children at the couple level, as well as **rWkcnt**, indicating whether the respondent has weekly contact with children at the respondent level. It does not have a variable comparable to **hWkcntfr**. The Gateway Harmonized SHARE includes **hWkcnt**,

indicating whether the respondent and/or their spouse have weekly contact with children at the couple level and **rWkcnt1m**, indicating monthly contact with children at the couple level.

rWpcntfr	1-2, 4-9	rWpcntfr:ww r frequency contact with parents in person/phone/mail	Categ
sWpcntfr	1-2, 4-9	sWpcntfr:ww s frequency contact with parents in person/phone/mail	Categ

How Constructed

The respondent is asked about the frequency of contact with each of their parents either in person, by phone, mail, e-mail, sms, or mms. Respondents can report contact using the following categories: daily, several times a week, about once a week, about every two weeks, about once a month, less than once a month, never. Weekly contact is defined as the respondent contacting their parents at least once a week. Monthly contact is defined as the respondent contacting their parents at least once a month.

rWpcnt indicates whether the respondent has any frequent (i.e., at least weekly) contact with any of their parents in person, by phone, mail, e-mail, sms, or mms. A code of 1 is used if the respondent reports any contact either daily, several times a week, or about once a week. A code of 0 is used if the respondent did not report any weekly contact. **rWpcnt1m** indicates whether the family respondent has at least monthly contact with any of their parents in person, by phone, mail, e-mail, sms or mms. A code of 1 is used if the respondent reports any contact either daily, several times a week, about once a week, about every two weeks, or about once a month. A code of 0 is used if the respondent did not report any monthly in-person contact. If the respondent doesn't have any living parents, a special missing value (.n) is assigned. If the respondent was not asked about their parents because they received a baseline questionnaire in Wave 4, a special missing value (.b) is assigned. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) for respondents who did not participate in the current wave.

rWpcntfr indicates the frequency with which the respondent has contact with any of their parents in person, by phone, mail, e-mail, sms, or mms. If a respondent has more than one living parent, the highest frequency of contact with any parent is reported. **rWpcntfr** is coded as follows: 1.Daily, 2.Several times a week, 3.About once a week, 4.About every two weeks, 5.About once a month, 6.Less than once a month, and 7.Never. If the respondent doesn't have any living parents, a special missing value (.n) is assigned. If the respondent was not asked about their parents because they received a baseline questionnaire in Wave 4, a special missing value (.b) is assigned. Don't know, refused, or other missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) for respondents who did not participate in the current wave.

sWpcnt, **sWpcnt1m**, and **sWpcntfr** indicate the frequency of the respondent's spouse's contact with their parents and are taken directly from the respondent's spouse's values to **rWpcnt**, **rWpcnt1m**, and **rWpcntfr**. In addition to the special missing codes used in **rWpcnt**, **rWpcnt1m**, and **rWpcntfr**, **sWpcnt**, **sWpcnt1m**, and **sWpcntfr** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Waves 1, 2, 5, and 7, the information used to derive these variables is only from information about parents provided by the respondent. However, in Waves 4, 6, 8, and 9, these variables are constructed from information about parents provided by the respondent, as well as information from the Social Network module.

Coverscreen data was not released for Israel in Wave 2, resulting in a high number of special missing (.m) values in this wave.

Additionally, new respondents in Wave 4 who received the baseline questionnaire and whose parents were not identified in the household roster or Social Network module, were not asked about parents. As such, we do not have this information for these respondents and they are coded as special missing (.b).

Cross-Study Differences with the HRS

The Harmonized HRS includes **hwpcnt**, which indicates whether the respondent and/or their spouse have weekly contact with any of their parents at the couple level. It does not have a variable comparable to **rwpcntfr**. The Gateway Harmonized SHARE includes **rwpcnt**, which indicates whether the respondent has weekly contact with their parents at the respondent level, and **rwpcnt1m**, indicating monthly contact with parents at the respondent level.

Transfers to Children or Grandchildren

Variable	Waves	Label	Type
hWtcany	1-2, 4-9	hWtcany:WW any transfer to children/grandchildren	Categ
hWtcamt	1-2	hWtcamt:WW amount transfer to children/grandchildren	Cont

How Constructed

hWtcany indicates whether the financial respondent reports that the respondent and spouse gave any financial gift worth 250 Euro or more, not including shared housing or shared food, to their children and/or grandchildren in the past year. A code of 0 indicates that the respondent and spouse report having no living children or grandchildren or did not give any financial support to their children and/or grandchildren. A code of 1 indicates that the respondent and spouse did give some financial support to their children and/or grandchildren. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked this question and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWtcamt is the amount of financial transfers altogether that the respondent and spouse made to their children or grandchildren in the past year. The financial respondent can report up to three transfers and **hWtcamt** sums these values if the recipient is a child or grandchild. **hWtcamt** is set to 0 if **hWtcany** is set to 0. **hWtcamt** is not calculated if any of the 3 transfer values is missing. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In all waves, the financial respondent is asked to identify who they provided a financial transfer to out of a list of possible relationships, if they reported providing any financial transfer. In Wave 4, the financial respondent can also identify someone from the Social Network module. In Waves 4, 6, 7, 8, and 9, respondents have the option of choosing "none of these" from the list of relationships.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked about financial transfers to their children.

hWtcamt is only available in Waves 1 and 2, when the amount of transfers is asked.

Cross-Study Differences with the HRS

The amount of financial transfers that the respondent and spouse gave to their children and grandchildren in the past year in SHARE is measured in Euro, whereas the equivalent measure in RAND HRS is measured in U.S. dollars. Therefore, conversion into a common currency is necessary before comparison of these data.

These variables are not available in the RAND HRS, but are available in the RAND Family data. HRS only asked for one total financial transfer amount. Unlike HRS, SHARE asked about financial transfers for up to 3 people.

hWtcany in the RAND Family data takes the value of (.k) if the respondent and spouse report not having any children. **hWtcany** in the Gateway Harmonized SHARE takes the value of 0 if the respondent and spouse report not having any children.

Transfers from Children or Grandchildren

Variable	Waves	Label	Type
hWfcany	1-2, 4-9	hWfcany:WW any transfers from children/grandchildren	Categ
hWfcamt	1-2	hWfcamt:WW amount transfer from children/grandchildren	Cont

How Constructed

hWfcany indicates whether the financial respondent reports that the respondent and spouse received any financial gift worth 250 Euro or more, not including shared housing or shared food, from their children and/or grandchildren in the past year. A code of 0 indicates that the respondent and spouse do not have any children and/or grandchildren or did not receive any financial support from their children and/or grandchildren. A code of 1 indicates that the respondent and spouse did receive some financial support from their children and/or grandchildren. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked this question and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWfcamt is the amount of financial transfers altogether that the respondent and spouse received from their children or grandchildren in the past year. The financial respondent can report up to three transfers and **hWfcamt** sums these values if the giver is a child or grandchild. **hWfcamt** is set to 0 if **hWfcany** is set to 0. **hWfcamt** is not calculated if any of the 3 transfer values is missing. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In Waves 1, 2, 5, 6, 7, 8, and 9, the financial respondent is asked to identify who they received a financial transfer from out of a list of possible relationships, if they reported receiving any financial transfer. While this is also true in Wave 4, in this wave the financial respondent can also identify someone from the Social Network module. In Waves 4, 6, 7, 8, and 9, respondents have the option of choosing "none of these" from the list of relationships.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked about financial transfers from their children.

hWfcamt is only available in Waves 1 and 2, when the amount of transfers is asked.

Cross-Study Differences with the HRS

The amount of financial transfers that the respondent and spouse received from their children and grandchildren in the past year in SHARE is measured in Euro, whereas the equivalent measure in RAND HRS is measured in U.S. dollars. Therefore, conversion into a common currency is necessary before comparison of these data.

These variables are not available in the RAND HRS, but are available in the RAND Family data. HRS only asked for one total financial transfer amount. Unlike HRS, SHARE asked about financial transfers for up to 3 people.

hWfcany in the RAND Family data takes the value of (.k) if the respondent and spouse report not having any children. **hWfcany** in the Gateway Harmonized SHARE takes the value of 0 if the respondent and spouse report not having any children.

Transfers to Parents

Variable	Waves	Label	Type
hWtpany	1-2, 4-9	hWtpany:WW any transfer to parents	Categ
hWtpamt	1-2	hWtpamt:WW amount transfer to parents	Cont

How Constructed

hWtpany indicates whether the financial respondent reports that the respondent and spouse gave any financial gift worth 250 Euro or more, not including shared housing or shared food, to their mother, father, mother-in-law, father-in-law, step-mother, or stepfather in the past year. A code of 0 indicates that the respondent and spouse report having no living parents or did not give any financial support to their parents. A code of 1 indicates that the respondent and spouse did give some financial support to their parents. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked this question and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWtpamt is the amount of financial transfers altogether that the respondent and spouse made to their parents in the past year. The financial respondent can report up to three transfers and **hWtpamt** sums these values if the recipient is a parent. **hWtpamt** is set to 0 if **hWtpany** is set to 0. **hWtpamt** is not calculated if any of the 3 transfer values is missing. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In all waves, the financial respondent is asked to identify who they provided a financial transfer to out of a list of possible relationships, if they reported providing any financial transfer. In Wave 4, the financial respondent can also identify someone from the Social Network module. In Waves 4, 6, 7, 8, and 9, respondents have the option of choosing "none of these" from the list of relationships.

In Wave 7, respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, responded about financial transfers to their parents.

hWtpamt is only available in Waves 1 and 2, when the amount of transfers is asked.

Cross-Study Differences with the HRS

The amount of financial transfers that the respondent and spouse gave to their parents in the past year in SHARE is measured in Euro, whereas the equivalent measure in RAND HRS is measured in U.S. dollars. Therefore, conversion into a common currency is necessary before comparison of these data.

These variables are not available in the RAND HRS, but are available in the RAND Family data. HRS only asked for one total financial transfer amount. Unlike HRS, SHARE asked about financial transfers for up to 3 people.

Transfers from Parents

Variable	Waves	Label	Type
hWfpany	1-2, 4-9	hWfpany:WW any transfers from parents	Categ
hWfpamt	1-2	hWfpamt:WW amount transfer from parents	Cont

How Constructed

hWfpany indicates whether the financial respondent reports that the respondent and spouse received any financial gift worth 250 Euro or more, not including shared housing or shared food, from their mother, father, mother-in-law, father-in-law, stepmother, or stepfather in the past year. A code of 0 indicates that the respondent and spouse report having no living parents or did not receive any financial support from their parents. A code of 1 indicates that the respondent and spouse did receive some financial support from their parents. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked this question and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWfpamt is the amount of financial transfers altogether that the respondent and spouse received from their parents in the past year. The financial respondent can report up to three transfers and **hWfpamt** sums these values if the giver is a parent. **hWfpamt** is set to 0 if **hWfpany** is set to 0. **hWfpamt** is not calculated if any of the 3 transfer values is missing. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In Waves 1, 2, 5, 6, 7, 8, and 9, the financial respondent is asked to identify who they received a financial transfer from out of a list of possible relationships, if they reported receiving any financial transfer. While this is also true in Wave 4, in this wave the financial respondent can also identify someone from the Social Network module. In Waves 4, 6, 7, 8, and 9, respondents have the option of choosing "none of these" from the list of relationships.

In Wave 7, respondents who were in Wave 3 (SHARELIFE Interview) responded about financial transfers from their parents.

hWfpamt is only available in Waves 1 and 2, when the amount of transfers is asked.

Cross-Study Differences with the HRS

The amount of financial transfers that the respondent and spouse received from their parents in the past year in SHARE is measured in Euro, whereas the equivalent measure in RAND HRS is measured in U.S. dollars. Therefore, conversion into a common currency is necessary before comparison of these data.

These variables are not available in the RAND HRS, but are available in the RAND Family data. HRS only asked for one total financial transfer amount. Unlike HRS, SHARE asked about financial transfers for up to 3 people.

Transfers to Other Relatives

Variable	Waves	Label	Type
hWtoany	1-2, 4-9	hWtoany:WW any transfer to other relatives	Categ
hWtoamt	1-2	hWtoamt:WW amount transfer to other relatives	Cont

How Constructed

hWtoany indicates whether the financial respondent reports that the respondent and spouse gave any financial gift worth 250 Euro or more, not including shared housing or shared food, to other relatives in the past year. These other relatives include: partner/spouse, brother, sister, grandparent, aunt, uncle, niece, nephew, or other relative. A code of 0 indicates that the respondent and spouse did not give any financial support to their other relatives. A code of 1 indicates that the respondent and spouse did give some financial support to their other relatives. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked this question and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWtoamt is the amount of financial transfers altogether that the respondent and spouse made to other relatives in the past year. The financial respondent can report up to three transfers and **hWtoamt** sums these values if the recipient is another type of relative. **hWtoamt** is set to 0 if **hWtoany** is set to 0. **hWtoamt** is not calculated if any of the 3 transfer values is missing. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In all waves, the financial respondent is asked to identify who they provided a financial transfer to out of a list of possible relationships, if they reported providing any financial transfer. In Wave 4, the financial respondent can also identify someone from the Social Network module. In Waves 4, 6, 7, 8, and 9, respondents have the option of choosing "none of these" from the list of relationships.

In Wave 7, respondents who were in Wave 3 (SHARELIFE Interview) responded about financial transfers to other relatives.

hWtoamt is only available in Waves 1 and 2, when the amount of transfers is asked.

Cross-Study Differences with the HRS

The amount of financial transfers that the respondent and spouse gave to other relatives in the past year in SHARE is measured in Euro, whereas the equivalent measure in RAND HRS is measured in U.S. dollars. Therefore, conversion into a common currency is necessary before comparison of these data.

These variables are not available in the RAND HRS, but are available in the RAND Family data. HRS only asked for one total financial transfer amount. Unlike HRS, SHARE asked about financial transfers for up to 3 people.

Transfers to Other Non-Relatives

Variable	Waves	Label	Type
hWtfany	1-2, 4-9	hWtfany:WW any transfer to other non-relatives	Categ
hWtfamt	1-2	hWtfamt:WW amount transfer to other non-relatives	Cont

How Constructed

hWtfany indicates whether the financial respondent reports that the respondent and spouse gave any financial gift worth 250 Euro or more, not including shared housing or shared food, to other non-relatives in the past year. In Waves 1, 2, and 5, these non-relatives include: friend, (ex-)colleague, neighbour, ex-spouse/partner, or other acquaintance. In Waves 4, 6, 7, 8, and 9, these non-relatives include: friend, (ex-)colleague/co-worker, neighbour, ex-spouse/partner, minister, priest, or other clergy, therapist or other professional helper, housekeeper/home health care provider, or other person not included in the list. A code of 0 indicates that the respondent and spouse did not give any financial support to other non-relatives. A code of 1 indicates that the respondent and spouse did give some financial support to other non-relatives. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked this question and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWtfamt is the amount of financial transfers altogether that the respondent and spouse made to other non-relatives in the past year. The financial respondent can report up to three transfers and **hWtfamt** sums these values if the recipient is a non-relative. **hWtfamt** is set to 0 if **hWtfany** is set to 0. **hWtfamt** is not calculated if any of the 3 transfer values is missing. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In all waves, the financial respondent is asked to identify who they provided a financial transfer to out of a list of possible relationships, if they reported providing any financial transfer. In Wave 4, the financial respondent can also identify someone from the Social Network module. In Waves 4, 6, 7, 8, and 9, respondents have the option of choosing "none of these" from the list of relationships.

In Waves 1, 2, and 5, non-relatives include friend, (ex-)colleague, neighbour, ex-spouse/partner, and other acquaintance. In Waves 4, 6, 7, 8, and 9, non-relatives include friend, (ex-)colleague/co-worker, neighbour, ex-spouse/partner, minister/priest/other clergy, therapist or professional helper, housekeeper/home health care provider, and none of these.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, responded about financial transfers to other non-relatives.

hWtfamt is only available in Waves 1 and 2, when the amount of transfers is asked.

Cross-Study Differences with the HRS

The amount of financial transfers that the respondent and spouse gave to other non-relatives in the past year in SHARE is measured in Euro, whereas the equivalent measure in RAND HRS is measured in U.S. dollars. Therefore, conversion into a common currency is necessary before comparison of these data.

These variables are not available in the RAND HRS, but are available in the RAND Family data. HRS only asked for one total financial transfer amount. Unlike HRS, SHARE asked about financial transfers for up to 3 people.

Transfers from Other Non-Relatives

Variable	Waves	Label	Type
hWffany	1-2, 4-9	hWffany:WW any transfers from other non-relatives	Categ
hWffamt	1-2	hWffamt:WW amount transfer from other non-relatives	Cont

How Constructed

hWffany indicates whether the financial respondent reports that the respondent and spouse received any financial gift worth 250 Euro or more, not including shared housing or shared food, from other non-relatives in the past year. In Waves 1, 2, and 5, these non-relatives include: friend, (ex-)colleague, neighbor, ex-spouse/partner, or other acquaintance. In Waves 4, 6, 7, 8, and 9, these non-relatives include: friend, (ex-)colleague/co-worker, neighbor, ex-spouse/partner, minister, priest, or other clergy, therapist or other professional helper, housekeeper/home health care provider, or other person not included in the list. A code of 0 indicates that the respondent and spouse did not receive any financial support from other non-relatives. A code of 1 indicates that the respondent and spouse did receive some financial support from other non-relatives. In Wave 7, respondents who were given the condensed interview along with the SHARELIFE interview were not asked this question and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWffamt is the amount of financial transfers altogether that the respondent and spouse received from other non-relatives in the past year. The financial respondent can report up to three transfers and **hWffamt** sums these values if the giver is a non-relative. **hWffamt** is set to 0 if **hWffany** is set to 0. **hWffamt** is not calculated if any of the 3 transfer values is missing. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

In Waves 1, 2, 5, 6, 7, 8, and 9, the financial respondent is asked to identify who they received a financial transfer from out of a list of possible relationships, if they reported receiving any financial transfer. While this is also true in Wave 4, in this wave the financial respondent can also identify someone from the Social Network module. In Waves 4, 6, 7, 8, and 9, respondents have the option of choosing "none of these" from the list of relationships.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, responded about financial transfers from other non-relatives.

hWffamt is only available in Waves 1 and 2, when the amount of transfers is asked.

Cross-Study Differences with the HRS

The amount of financial transfers that the respondent and spouse received from other non-relatives in the past year in SHARE is measured in Euro, whereas the equivalent measure in RAND HRS is measured in U.S. dollars. Therefore, conversion into a common currency is necessary before comparison of these data.

These variables are not available in the RAND HRS, but are available in the RAND Family data. HRS only asked for one total financial transfer amount. Unlike HRS, SHARE asked about financial transfers for up to 3 people.

Continuous Variable Distributions

Net Value of Financial Transfers			
Variable	Waves	Label	Type
hWfrec	1-2	hWfrec:ww total amount transfers received	Cont
hWtgiv	1-2	hWtgiv:ww total amount transfers given	Cont
hWftot	1-2	hWftot:ww total net transfers	Cont

How Constructed

hWfrec indicates the total amount of financial transfers that the respondent and spouse received in the past year. It is a summary variable which includes the following components:

1. amount of transfers from children or grandchildren (**hWfcamt**)
2. amount of transfers from parents or parents-in-law (**hWfpamt**)
3. amount of transfers from other relatives (**hWfoamt**)
4. amount of transfers from other non-relatives (**hWffamt**)

$$\mathbf{hWfrec} = \mathbf{hWfcamt} + \mathbf{hWfpamt} + \mathbf{hWfoamt} + \mathbf{hWffamt}.$$

hWtgiv indicates the total amount of financial transfers that the respondent and spouse gave in the past year. It is a summary variable which includes the following components:

1. amount of transfers to children or grandchildren (**hWtcamt**)
2. amount of transfers to parents or parents-in-law (**hWtpamt**)
3. amount of transfers to other relatives (**hWtoamt**)
4. amount of transfers to other non-relatives (**hWtfamt**)

$$\mathbf{hWtgiv} = \mathbf{hWtcamt} + \mathbf{hWtpamt} + \mathbf{hWtoamt} + \mathbf{hWtfamt}.$$

hWftot indicates the net value of financial transfers in the past year. $\mathbf{hWftot} = \mathbf{hWfrec} - \mathbf{hWtgiv}$.

A value will not be calculated for **hWfrec**, **hWtgiv**, and **hWftot** if one of the values is missing. Missing values for these variables are assigned (.m). **hWfrec**, **hWtgiv**, and **hWftot** are set to blank missing (.) when the respondent did not participate in the current wave.

Cross Wave Differences in SHARE

Refer to the "Cross Wave Differences in SHARE" section of each component to identify differences between waves.

hWfrec, **hWtgiv**, and **hWftot** are only available for Waves 1 and 2 when financial transfer amounts were asked.

Cross-Study Differences with the HRS

These values in SHARE are measured in Euro whereas the equivalent measure in RAND HRS is measured in U.S. dollars. Therefore, conversion into a common currency is necessary before comparison of these data.

Refer to "Cross-Study Differences with the HRS" section of each component to identify differences with the RAND HRS variable of the same name.

Continuous Variable Distributions

Variable	N	Mean	Std.Dev	Minimum	Maximum	Total missing

Frequency of Participation in Social Activities

Variable	Waves	Label	Type
rWsocwk	1-2	rWsocwk:ww r any weekly social activities	Categ
sWsocwk	1-2	sWsocwk:ww s any weekly social activities	Categ
rWsocyr	4-9	rWsocyr:ww r any yearly social activities	Categ
sWsocyr	4-9	sWsocyr:ww s any yearly social activities	Categ

How Constructed

rWsocwk indicates whether the respondent participates in any social activities on a weekly basis. Respondents are first asked whether they participate in any of a list of activities, and then respondents are asked how frequently they participate in those activities. A code of 0 indicates that the respondent does not participate in social groups or social activities, or does so less often than weekly. A code of 1 indicates that the respondent does participate in at least one of the following social activities, either "daily" or "almost every week":

1. Done voluntary or charity work
2. Cared for a sick or disabled adult
3. Provided help to family, friends or neighbors
4. Attended an educational or training course
5. Gone to a sport, social or other kind of club
6. Taken part in a religious organization (church, synagogue, mosque etc.)
7. Taken part in a political or community-related organization.

rWsocyr indicates whether the respondent has participated in any social activities in the past 12 months. A code of 0 indicates that the respondent does not participate in social groups or social activities. In Waves 4 and 5, a code of 1 indicates that the respondent has participated in at least one of the following social activities in the past 12 months:

1. Done voluntary or charity work
2. Attended an educational or training course
3. Gone to a sport, social or other kind of club
4. Taken part in activities of a religious organization (church, synagogue, mosque etc.)
5. Taken part in a political or community-related organization.

Starting in Wave 6, a code of 1 indicates that the respondent has participated in at least one of the following social activities in the past 12 months:

1. Done voluntary or charity work
2. Attended an educational or training course
3. Gone to a sport, social or other kind of club
4. Taken part in a political or community-related organization.

Starting in Wave 5, **rWsocy**r is assigned special missing (.n) if the respondent was not asked this question because they reside in a nursing home. Starting in Wave 6, **rWsocy**r is assigned special missing (.p) if the question was skipped because the interview was conducted partially or completely by proxy. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **rWsocwk** and **rWsocy**r are set to blank missing (.) for respondents who did not respond to the current wave.

sWsocwk and **sWsocy**r indicate whether the respondent's spouse participates in social groups. They are taken from the spouse's values to **rWsocwk** and **rWsocy**r. In addition to the special missing codes used in **rWsocwk** and **rWsocy**r, **sWsocwk** and **sWsocy**r employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

As a result of the way questions on social activities are asked, **rWsocwk** is available for Waves 1 and 2. **rWsocy**r is available beginning in Wave 4.

Whether or not the respondent participates in "a religious organization (church, synagogue, mosque etc.)" is only included in the list of social activities in Waves 4 and 5.

Starting in Wave 5, **rWsocy**r is assigned special missing (.n) if the respondent was not asked this question because they reside in a nursing home. Starting in Wave 6, **rWsocy**r is assigned special missing (.p) if the question was skipped because the interview was conducted partially or completely by proxy.

Cross-Study Differences with the HRS

The Harmonized HRS includes **rWsocwk**, indicating weekly participation, and **rWsocmn**, indicating monthly participation in social activities.

Frequency of Participation in Religious Activities

Variable	Waves	Label	Type
rWrelgwk	1-2	rWrelgwk:WW r any weekly religious groups	Categ
sWrelgwk	1-2	sWrelgwk:WW s any weekly religious groups	Categ
rWrelgyr	4-5	rWrelgyr:WW r any yearly religious groups	Categ
sWrelgyr	4-5	sWrelgyr:WW s any yearly religious groups	Categ
rWsocrelg_s	1-2	rWsocrelg_s:WW r freq participate religous groups	Categ
sWsocrelg_s	1-2	sWsocrelg_s:WW s freq participate religous groups	Categ

How Constructed

rWrelgwk indicates whether the respondent participates in any weekly activities of a religious organization. Respondents are first asked whether they have taken part in a religious organization in the past month, and if so, whether they participate almost daily, almost every week, or less often. A code of 0 indicates that the respondent does not participate in activities of a religious organization at all or does so less often than weekly. A code of 1 indicates that the respondent does participate in activities of a religious organization either almost daily or almost every week. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **rWrelgwk** is set to blank missing (.) for respondents who did not respond to the current wave.

rWrelgyr indicates whether the respondent has participated in any activities of a religious organization in the past 12 months. A code of 0 indicates that the respondent has not participated in activities of a religious organization in the past 12 months. In Wave 5, this question was only asked in certain countries and certain language questionnaires. A code of 1 indicates that the respondent has participated in activities of a religious organization in the past 12 months. Special missing (.s) is assigned when this question was not asked in Wave 5 for the country or language of the respondent. In Wave 5, **rWrelgyr** is assigned special missing (.n) if the respondent was not asked this question because they reside in a nursing home. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **rWrelgyr** is set to blank missing (.) for respondents who did not respond to the current wave.

rWsocrelg_s indicates how frequently the respondent participates in activities of a religious organization. **rWsocrelg_s** is coded as follows: 1.almost daily, 2.almost every week, 3.less often, 4.never. **rWsocrelg_s** is assigned a value of 4 if the respondent does not participate in activities of a religious organization at all. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **rWsocrelg_s** is set to blank missing (.) for respondents who did not respond to the current wave.

sWrelgwk, **sWrelgyr**, and **sWsocrelg_s** indicate whether or how frequently the respondent's spouse participates in religious activities. They are taken from the spouse's values to **rWrelgwk**, **rWrelgyr**, and **rWsocrelg_s**. In addition to the special missing codes used in **rWrelgwk**, **rWrelgyr**, and **rWsocrelg_s**, **sWrelgwk**, **sWrelgyr**, and **sWsocrelg_s** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Because of the way participation in religious activities are asked, **rWrelgwk** and **rWsocrelg_s** are available in Waves 1 and 2. **rWrelgyr** is available in Waves 4 and 5.

Taking part in activities of a religious organization was only asked in certain countries and in certain languages in Wave 5. In particular, it was only asked in Spain, France, Estonia, in the French version of the Belgium survey, and in the Arabic version of the Israeli survey. If the question was not asked for the country or language of the respondent, then special missing (.s) is assigned. In Wave 5, if the question is not asked because the respondent resides in a nursing home, then special missing (.n) is assigned.

Cross-Study Differences with the HRS

The Harmonized HRS includes **rWrelgwk**, indicating whether the respondent participates weekly in religious services, and **rWsocrelg_h**, indicating the frequency with which the respondent participates in religious services. However, **rWsocrelg_h** in the Harmonized HRS uses a different answer scale than **rWsocrelg_s** in the Gateway Harmonized SHARE, so the measures are not strictly comparable.

H. Employment History

Currently Working for Pay

Variable	Waves	Label	Type
rWwork	1-2, 4-9	rWwork:WW R working for pay	Categ
sWwork	1-2, 4-9	sWwork:WW S working for pay	Categ
rWwork2	1-2, 4-9	rWwork2:WW R Works at 2nd job	Categ
sWwork2	1-2, 4-9	sWwork2:WW S Works at 2nd job	Categ

How Constructed

For Wave 1 and for new respondents in subsequent waves, **rWwork** indicates whether the individual did any paid work in the last four weeks. Starting in Wave 2, **rWwork** indicates whether the individual did any paid work since the last interview for previously interviewed respondents. **rWwork** takes a value of 1 if the individual did work for pay and 0 otherwise. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

rWwork2 indicates whether the respondent is working more than one job. **rWwork2** takes a value of 1 if the individual works more than 1 job, and a 0 otherwise. **rWwork2** takes a value of 0 (the respondent does not work more than one job) whenever **rWwork** is 0. In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWwork records whether the respondent's spouse in the current wave is working for pay. Its value is taken from the spouse's **rWwork**. **sWwork2** records whether the respondent's spouse in the current wave is working more than one job. Its value is taken from the spouse's **rWwork2**. In addition to the special missing codes employed by **rWwork** and **rWwork2**, **sWwork** and **sWwork2** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Wave 1 respondents are asked whether they did any paid work in the last four weeks. Starting in Wave 2, new respondents are asked the same question as in Wave 1, while returning respondents are asked whether they did any paid work since the last interview.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about working more than one job.

Cross-Study Differences with the HRS

The HRS asks the following question: "are you doing any work for pay at the present time?" Unlike the HRS, the SHARE question refers specifically to activities done in the last four weeks (or since the last interview for returning respondents).

The HRS surveys respondents about a second job by asking, "are you doing any other work for pay now, such as (another) business of your own, a second job, or the military reserve." Unlike the HRS, the SHARE asks respondents, "Do you currently have more than one job?"

Whether Self-Employed

Variable	Waves	Label	Type
rWslfemp	1-2, 4-9	rWslfemp:WW r Whether Self-Employed	Categ
sWslfemp	1-2, 4-9	sWslfemp:WW s Whether Self-Employed	Categ

How Constructed

rWslfemp is taken from the SHARE question asking respondents to identify themselves as an employee, a civil servant, or self-employed in their main job. Starting in Wave 5, the respondent is asked to identify themselves as a private sector employee, a public sector employee, or self-employed in their main job. The question is only asked if the respondent reported being employed or self-employed or doing paid work. **rWslfemp** takes a value of 1 if the respondent reports being self-employed in their main jobs and 0 otherwise. In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWslfemp records whether the respondent's spouse in the current wave is self-employed. Its value is taken from the spouse's **rWslfemp**. In addition to the special missing codes employed by **rWslfemp**, **sWslfemp** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Waves 1, 2 and 4, respondents were asked to identify themselves as an employee, a civil servant, or self-employed in their main job. Starting in Wave 5, respondents were asked to identify themselves as a private sector employee, a public sector employee, or self-employed in their main job.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about being self-employed.

Cross-Study Differences with the HRS

Unlike the HRS which asks, "do you work for someone else, are you self-employed, or what?" the SHARE allows respondents to identify themselves as employees, civil servant, or self-employed. Starting in Wave 5, SHARE allows respondents to identify themselves as private sector employees, public sector employees, or self-employed.

Labor Force Status

Variable	Waves	Label	Type
rWlbrf_s	1-2, 4-9	rWlbrf_s:WW R labor force status	Categ
sWlbrf_s	1-2, 4-9	sWlbrf_s:WW S labor force status	Categ

How Constructed

Labor force status is elicited by means of the question, “in general, how would you describe your current situation?” after which the respondent is shown a card with the above set of labor force statuses to choose from. **rWlbrf_s** summarizes the labor force status for the respondent at each wave as: 1.employed or self-employed, 3.unemployed, 5.retired, 6.permanently sick or disabled, or 8.homemaker. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWlbrf_s summarizes the labor force status for the respondent's spouse or partner. It is taken from the spouse's **rWlbrf_s**. In addition to the special missing codes employed by **rWlbrf_s**, **sWlbrf_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

Unlike the HRS, the SHARE asks directly which labor status most generally describes the respondent's situation. In the RAND HRS, the derivation of **rWlbrf** uses different survey questions from which respondents can provide evidence of work, retirement and disability alone or in combination with other labor statuses (e.g. looking for part-time or full-time work).

Because of differences in surveys and variables' derivation, **rWlbrf_s** in the Gateway Harmonized SHARE uses a slightly different categorization than **rWlbrf** in the RAND HRS. Specifically, **rWlbrf_s** does not separate out full-time and part-time work, which are treated as distinct categories in **rWlbrf**. Also, unlike **rWlbrf** in the RAND HRS, **rWlbrf_s** does not feature the statuses of “partly retired” and “not in the labor force”. On the other hand, the category “homemaker” is present in **rWlbrf_s**, but not in **rWlbrf**.

In The Labor Force

Variable	Waves	Label	Type
rWinlbrf	1-2, 4-9	rWinlbrf:WW =1 if r is in the labor force	Categ
sWinlbrf	1-2, 4-9	sWinlbrf:WW =1 if s is in the labor force	Categ

How Constructed

rWinlbrf is an indicator for whether the respondent considered themselves as part of the labor force. This definition includes those who are working for pay and those who are not working for pay but actively seeking work as part of the labor force. This variable is derived using the question "in general, how would you describe your current situation." A value of 0 is assigned if the respondent describes their working status as retired, permanently sick or disabled, or a homemaker, to indicate not being in the labor force. A value of 1 is assigned if the respondent describes their working status as employed, self-employed, or unemployed, to indicate being in the labor force. If the respondent reports a labor force status outside of the categories of **rWinlbrf**, a special missing value (.o) indicates another labor force status. Don't know, refused, or other missing responses of **rWinlbrf** are assigned special missing codes (.d), (.r), (.m), respectively. **rWinlbrf** is set to plain missing (.) for respondents who did not respond to the current wave.

sWinlbrf summarizes the labor force status for the respondent's spouse or partner. It is taken from the spouse's values to **rWinlbrf**. In addition to the special missing codes employed by **rWinlbrf**, **sWinlbrf** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

Unlike the HRS, SHARE asks the respondent directly which labor force status most generally describes their situation.

Unemployed

Variable	Waves	Label	Type
rWunemp	1-2, 4-9	rWunemp:WW =1 if r is unemployed	Categ
sWunemp	1-2, 4-9	sWunemp:WW =1 if s is unemployed	Categ

How Constructed

rWunemp is an indicator for whether the respondent considered themselves as unemployed. This definition includes those who are not working but actively seeking work as unemployed. This variable is derived using the question "in general, how would you describe your current situation." If the respondent describes their working status as employed or self-employed, then **rWunemp** is set to be employed and a value of 0 is assigned. If the respondent describes their working status as unemployed, then a value of 1 is assigned. Special missing (.x) is assigned to respondents who are not working for pay or are not in the labor force, meaning those who report being retired, permanently sick or disabled, or a homemaker. If the respondent reports a labor force status outside of the categories of **rWunemp**, a special missing value (.o) indicates another labor force status. Don't know, refused, or other missing responses of **rWunemp** are assigned special missing codes (.d), (.r), (.m), respectively. **rWunemp** is set to plain missing (.) for respondents who did not respond to the current wave.

sWunemp indicates if the respondent's spouse or partner is considered unemployed. It is taken from the spouse's values to **rWunemp**. In addition to the special missing codes employed by **rWunemp**, **sWunemp** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

Unlike the HRS, SHARE asks the respondent directly which labor force status most generally describes their situation.

Hours of Work Per Week at Current Job

Variable	Waves	Label	Type
rWjhours	1-2, 4-9	rWjhours:WW r Hours worked/week main job	Cont
sWjhours	1-2, 4-9	sWjhours:WW s Hours worked/week main job	Cont
rWjhour2	1-2, 4-7	rWjhour2:WW r Hours worked/week 2nd job	Cont
sWjhour2	1-2, 4-7	sWjhour2:WW s Hours worked/week 2nd job	Cont

How Constructed

rWjhours is the usual number of hours per week the respondent works at their main jobs, excluding meal breaks and including paid or unpaid overtime.

All respondents reporting working for pay are asked about the number of hours per week worked at the main job. **rWjhours** is set to a (.w) missing code if the respondent is not working for pay. **rWjhours** is set to a (.p) missing code if the respondent has been interviewed previously but reports not working continuously since their previous interview. In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

rWjhour2 is the usual number of hours per week the respondent works at a secondary job. **rWjhour2** is set to a (.w) missing code if the respondent is not working a second job. In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). Starting in Wave 8, the question was no longer asked. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWjhours is the number of hours the respondent's spouse in the current wave works at their main job. Its value is taken from the spouse's **rWjhours**. **sWjhour2** is the number of hours the respondent's spouse in the current wave works at their secondary job. Its value is taken from the spouse's **rWjhour2**. In addition to the special missing codes employed by **rWjhours** and **rWjhour2**, **sWjhours** and **sWjhour2** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Starting in Wave 2, returning respondents who report not working continuously since their previous interview are not asked about the usual number of hours worked per week at their main job.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about the usual number of hours worked per week and those hours worked at a second job.

Starting in Wave 8, the usual number of hours per week the respondent works at a secondary job question was no longer asked.

Cross-Study Differences with the HRS

No differences known.

Weeks Worked Per Year at Job

Variable	Waves	Label	Type
rWjweeks_s	1-2, 4-5	rWjweeks_s:wW r Weeks worked/year main job	Cont
sWjweeks_s	1-2, 4-5	sWjweeks_s:wW s Weeks worked/year main job	Cont
rWjweek2_s	1-2, 4-7	rWjweek2_s:wW r Weeks worked/year 2nd job	Cont
sWjweek2_s	1-2, 4-7	sWjweek2_s:wW s Weeks worked/year 2nd job	Cont

How Constructed

rWjweeks_s is the number of weeks the respondents work per year at their main jobs, including paid holidays, and is available from Wave 1 to Wave 5. **rWjweek2_s** is the number of weeks the respondents work per year at their secondary jobs, including paid holidays.

Respondents working for pay are asked about the number of months per year worked at their main job. **rWjweeks_s** is the weekly equivalent of the number of months worked per year. It is obtained by multiplying the number of reported months by 4.3333. **rWjweeks_s** is set to a (.w) missing code if the respondent is not working for pay. **rWjweeks_s** is set to a (.c) missing code if the respondent has been interviewed previously but reports not working continuously since their previous interview. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

Respondents working more than one job are asked about the number of months per year worked at the secondary job. **rWjweek2_s** is the weekly equivalent of the number of months worked per year. It is obtained by multiplying the number of reported months by 4.3333. **rWjweek2_s** is set to a (.w) missing code if the respondent is not working a second job. In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked these questions and are assigned special missing value (.c). Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWjweeks_s and **sWjweek2_s** are the number of weeks the respondent's spouse works per year at their main and secondary job, respectively. Their values are taken from the spouse's **rWjweeks_s** and **rWjweek2_s**, respectively. In addition to the special missing codes employed by **rWjweeks_s** and **rWjweek2_s**, **sWjweeks_s** and **sWjweek2_s** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Starting in Wave 2, returning respondents who report not working continuously since their previous interview are not asked about the usual number of months worked per year at their main job.

Starting in Wave 6, respondents are not asked how many months a year are normally worked for the current main job, so **rWjweeks_s** is not available.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about the number of months the respondent works per year at their second job.

Starting in Wave 8, the question asking the number of months the respondent works per year at their second job was no longer asked.

Cross-Study Differences with the HRS

Unlike the HRS, the SHARE does not elicit the number of weeks worked per year but the number of months. **rWjweeks_s** and **rWjweek2_s** are derived by multiplying the reported number of months by 4.3333.

How Constructed

Earnings are denominated in nominal Euros. Earnings are elicited in Euros in all SHARE countries except in Denmark, Sweden, Switzerland, Poland, Czech Republic, Hungary, and Estonia, where local currencies are used.

The wage rate is calculated using the respondent's take home pay and contracted hours per week on their main job. Both variables are asked in the employment and pensions (EP) module to all respondents. The EP module first asks the respondent whether they are an employee, civil servant, or self-employed in their main job. Those who report being either an employee or civil servant are then asked to provide the total contracted hours each week in their main job. Next, the EP module elicits frequency and amount of payment. Respondents who report being an employee or civil servant are asked how often they get paid from their main job and how much the last payment was, before deductions and taxes. SHARE does not provide imputations for the amount of the last payment even though unfolding brackets are asked of respondents who report not knowing the amount. We provide imputations for respondents with missing wage rates. From Wave 4 onward, the SHARE questionnaire does not include questions about amount and frequency of payment from the main job. As such, this variable is not created for Wave 4 forward.

rWwgihr and **rWwgiwk** are the respondent's hourly and weekly wage rates, respectively. **rWwgihr** and **rWwgiwk** are only calculated for respondents who report being an employee or civil servant, having worked for pay in the last 4 weeks or being temporarily away from work. Therefore, **rWwgihr** and **rWwgiwk** are always missing for respondents who report being unemployed or self-employed.

If the respondent reports being an employee or civil servant at the time of the interview, they are asked how much the main job pays. The exact wording is: "Before any deductions for tax, national insurance or pension and health contributions, union dues and so on, about how much was the last payment?" The reported take-home pay can refer to different periods, e.g. pay per week, per two weeks, per calendar month, per three months, per six months, or per year. Contracted hours per week at the main job are asked using, "What are your total basic or contracted hours each week in this job, excluding meal breaks and any paid or unpaid overtime?". **rWwgiwk** is the weekly wage rate, obtained by appropriately adjusting the respondent's take-home pay on the main job for the periodicity of the reported amount. **rWwgihr** is calculated as the ratio of the weekly wage rate to the usual hours worked per week on the main job. If the respondent reports working 0 hours per week, **rWwgihr** is set to 0 regardless of the reported value for the take-home pay. Both variables are before taxes. Both variables are assigned special missing (.w) if the respondent is not currently working and special missing (.s) if the respondent is self-employed.

rWwgihr and **rWwgiwk** are both based on imputed values. Unlike the measures in the asset and income sections which employ imputations provided by SHARE, **rWwgihr** and **rWwgiwk** are imputed specifically for the Gateway Harmonized SHARE. Wages are imputed using a predictive mean matching imputation method (PMM) similar to the method used in other Harmonized datasets. For more information on the imputation method see section 1.5. Missing Values, Nonresponse, and Imputations.

There are a few cases where no donors are available and the respondent did not identify a minimum or a maximum bracket value. In these cases, the imputed wage rate has been calculated by adjusting the respondent's take-home pay for the

periodicity of that payment. Waiting to impute these cases using the calculated wage rate provides more donor values since the donor pool is no longer restricted by pay-period. These few cases are imputed using only country-specific samples. The calculation of **rWwgihr** also requires imputing the number of contracted hours worked per week. We impute the number of contracted hours for all respondents who reported being an employee or civil servant. We do not impute values for **rWwgihr** and **rWwgiwk** for respondents who are unemployed or self-employed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWwgihr is the respondent's spouse's hourly wage rate. It is taken from the spouse's **rWwgihr**. **sWwgiwk** is the respondent's spouse's weekly wage rate. It is taken from the spouse's **rWwgiwk**. In addition to the special missing codes employed by **rWwgihr** and **rWwgiwk**, **sWwgihr** and **sWwgiwk** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWffreq is the imputation flag indicating whether the frequency of payments was imputed for the calculation of **rWwgihr** and **rWwgiwk**. A code of 1 indicates that the respondent reported a payment frequency. A code of 5 indicates that the frequency of payments was imputed. **rWfpayment** is the imputation flag indicating whether the payment value was imputed for the calculation of **rWwgihr** and **rWwgiwk**. A code of 1 indicates that the respondent reported a continuous value and no imputation was necessary. A code of 2 indicates that the value was imputed based on a complete bracket. A code of 3 indicates that the value was imputed based on an incomplete bracket. A code of 5 indicates that the value was imputed without any bracket information. **rWfhours** is the imputation flag indicating whether the number of contracted hours was imputed for the calculation of **rWwgihr**. A code of 1 indicates that the respondent reported a number of contracted hours. A code of 1 indicates that the number of contracted hours was imputed. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWffreq indicates whether the frequency of payment was imputed for the calculation of **sWwgihr** and **sWwgiwk** and is based on the respondent's spouse's value for **rWffreq**. **sWfpayment** indicates whether the value of payment was imputed for the calculation of **sWwgihr** and **sWwgiwk** and is based on the respondent's spouse's value for **rWfpayment**. **sWfhours** indicates whether the number of contracted hours was imputed for the calculation of **sWwgihr** and is based on the respondent's spouse's value for **rWfhours**. In addition to the special missing codes employed by **rWffreq**, **rWfpayment**, and **rWfhours**, **sWffreq**, **sWfpayment**, and **sWfhours** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

SHARE does not include questions related to take-home pay from work after Wave 2, so this variable is not created for Waves 4 and forward.

In Wave 1, respondents of Euro countries were allowed to choose whether to report financial amounts in Euros or in their local pre-Euro currencies. In Wave 2 and forward, amounts had to be reported in Euros in the Euro countries.

Cross-Study Differences with the HRS

The RAND HRS includes imputations for the wage rate but the imputation procedure is significantly different from the one adopted here. The RAND HRS imputes the wage rate for unemployed respondents using the wage rate of the most recent job, if available. The RAND HRS does not impute missing wage rates for employed respondents. For the Gateway Harmonized SHARE, we do not impute the wage rate for unemployed respondents, but we do impute missing wage rates for employed respondents. The values in the RAND HRS are presented in nominal US dollars, whereas the values in the Gateway Harmonized SHARE are presented in Euros. Conversion to a common currency is necessary before comparison of these variables.

Years of Tenure on Current Job

Variable	Waves	Label	Type
rWjcten	1-2, 4-9	rWjcten:ww r Current Job Tenure	Cont
sWjcten	1-2, 4-9	sWjcten:ww s Current Job Tenure	Cont

How Constructed

rWjcten is the respondent's years of tenure on the current job at the current wave.

Job tenure at each interview is derived using information on current work status, reported job changes, current job start year and current interview year. Specifically, years of tenure on the current job are calculated as current interview date minus current job start date and rounded to the nearest tenth.

If the respondent reports a job for the first time, **rWjcten** is calculated by subtracting the reported date when the job started from the interview date. In subsequent waves, if the respondent reports that they have not changed job or employer since the previous interview, **rWjcten** is calculated by subtracting the originally reported start date from the current interview date. If the respondent is not working, **rWjcten** is set to a (.w) missing code. If the longitudinal respondent was working for pay and reported not working consistently since the last wave but did not report a job situation as "Employed or self-employed (including working for family business)", then **rWjcten** is set to an (.a) missing code, meaning they were not asked. If the respondent reports starting work at a date later than the current interview date, **rWjcten** is set to a (.n) special missing code. If the respondent reported that their job did not change since the last wave but they reported not currently working for pay in the last wave, and reported working for pay in this wave, **rWjcten** is set to a (.i) missing code. In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWjcten is the respondent's spouse's years of tenure on the current job. It is taken from the spouse's **rWjcten**. In addition to the special missing codes employed by **rWjcten**, **sWjcten** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about the date they started working at their current job.

Cross-Study Differences with the HRS

After the initial report of a job, **rWjcten** in the RAND HRS is calculated using the job start date from the interview when the job was first reported (unless the respondent reports being self-employed, in which case the given job start date is used). **rWjcten** in the Gateway Harmonized SHARE does not ever use the interview date when the job was first reported to determine tenure if the respondent continues to hold the same job. Instead, it always computes tenure using the originally reported start date of the job.

Also, unlike the HRS, the SHARE only surveys respondents as to the year they started their current job. As a result, the Gateway Harmonized SHARE measure **rWjcten** is less accurate than its RAND HRS counterpart.

ISCO Occupation Code for Current Job

Variable	Waves	Label	Type
rWjisco	1-2, 4-9	rWjisco:WW r ISCO code for current job	Categ
sWjisco	1-2, 4-9	sWjisco:WW s ISCO code for current job	Categ

How Constructed

rWjisco is the 1988 International Standard Classification of Occupations (ISCO-88) major group code for the respondent's current main job.

In Wave 1 respondents were asked the names or titles of their jobs. SHARE then organized these names/titles using the ISCO-88 for the purpose of international comparison. While SHARE provides the 4-digit ISCO-88 code where applicable, **rWjisco** categorizes the occupations with less granularity using the highest level or first digit ISCO-88 code. For more information about the ISCO-88 Codes used in Wave 1 see: <https://ilostat.ilo.org/methods/concepts-and-definitions/classification-occupation/>. In Wave 2 through Wave 5, baseline respondents and respondents who reported a job change since the last wave were asked to identify their jobs by selecting from a list of 10 ISCO titles. These 10 titles map to the 2-digit ISCO-88 categories used in Wave 1. Starting in Wave 6, respondents are asked an open-ended question to name their current main jobs. SHARE uses the current (2008) International Standard Classification of Occupations (ISCO-88) by the International Labour Organization (ILO) to classify and aggregate occupational information. The codes are as follows: 0.Armed forces occupations, 1.Managers, 2.Professionals, 3.Technicians and associate professionals, 4.Clerical support workers, 5.Service and sales workers, 6.Skilled agricultural, forestry, and fishery workers, 7.Craft and related trades workers, 8.Plant and machine operators and assemblers, 9. Elementary occupations. For more information, see SHARE cross-wave comparisons (<https://share-eric.eu/data/data-documentation/questionnaires/cross-wave-comparison>).

rWjisco also feeds forward the occupation reported in the previous wave for respondents who reported having the same job as they did in the last wave. In addition to the ISCO-88 codes, **rWjisco** also employs several special missing codes. If SHARE was not able to categorize the job title into any existing ISCO-88 code, a special missing code of (.o) is used. If the occupation reported by the respondent was not applicable, a special missing code of (.z) is used. If the respondents did not know their occupations, a special missing code of (.d) is used. If the respondents refused to identify their occupations, a special missing code of (.r) is used. If the occupation given by the respondent was invalid, a special missing code of (.i) is used. If the respondents did not give an answer when asked for their occupations, a special missing code of (.n) is used. If the respondent was not employed, a special missing code of (.e) is used. If the respondent reports being in school, a special missing code of (.s) is used. If the respondent reported being a housewife/houseman, a special missing code of (.h) is used. If the respondent reported not working, a special missing code of (.w) is used. If the longitudinal respondent was working for pay and reported not working consistently since the last wave but did not report a job situation as "Employed or self-employed (including working for family business)", then **rWjisco** is set to a (.q) missing code, meaning they were not asked. In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). If the response is missing for another reason, a special missing code of (.m) is used. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWjisco indicates the ISCO-88 Occupation code for the respondent's spouse's current job. It is taken from the spouse's **rWjisco**. In addition to the special missing codes employed by **rWjisco**, **sWjisco** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Occupation is surveyed in a free response format in Wave 1 and Wave 6 and forward. SHARE organized these responses into ISCO-88 major group codes and special missing categories. In Wave 2 through Wave 5, SHARE surveys occupation using showcards where the respondents identifies their occupations by selecting from a list of ISCO-88 titles.

The occupation question wording changed significantly between Wave 1 and Wave 2 forward. In Wave 1, for respondents who reported doing any paid work in the last 4 weeks, being only temporarily away from work, or being employed or self-employed the survey asked, "In your main job are you an employee, a civil servant, or a self-employed?" If the respondents

reply they are employees or civil servants, the survey then asked, "What is your main job called? Please give the exact name or title." In Wave 2 and forward, for respondents who reported doing any paid work in the last 4 weeks, being only temporarily away from work, or being employed or self-employed and who also were either new to the panel, had made a change to their job since the last interview, or had not worked continuously since the last sample, the survey asked to then specify their job. For Wave 2 through Wave 5, the respondent was asked "Please look at showcard [showcard #]. What best describes this job?" The showcard contained the following list of job names/titles: "1. Legislator, senior official or manager, 2. Professional, 3. Technician or associate professional, 4. Clerk, 5. Service worker and shop and market sales worker, 6. Skilled agricultural or fishery worker, 7. Craft and related trades worker, 8. Plant and machine operator or assembler, 9. Elementary occupation, 10. Armed forces." Starting in Wave 6, the respondent was asked an open-ended question "What is this job called? Please give the exact name or title." As is clear, there are significant differences between the waves. In Wave 1 and Wave 6 and forward, SHARE derives the ISCO-88 codes from the free response answers given by the respondent. In Wave 2 through Wave 5, the respondent selected from a list of ISCO-88 titles. Also in Wave 1, self-employed respondents were not asked to identify their occupation, whereas self-employed respondents were asked to identify their occupation in Wave 2 forward.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview) were asked questions about the name or title of their current job.

Cross-Study Differences with the HRS

The RAND HRS does not categorize occupations using ISCO-88. **rWjisco** is a SHARE specific variable which attempts to capture similar information as **rWjcocc** in the RAND HRS.

NACE Industry Code for Current Job

Variable	Waves	Label	Type
rWjnace	1-2, 4-9	rWjnace:WW r NACE code for current job	Categ
sWjnace	1-2, 4-9	sWjnace:WW s NACE code for current job	Categ

How Constructed

rWjnace is the NACE Code for the industry of the respondent's current job.

In Wave 1, respondents were asked what kind of business or industry they are in. SHARE then organizes business/industries using Version 4 Rev. 1 1993 of the NACE Codes for the purpose of international comparison. While SHARE provides the 3-digit NACE Codes where applicable, **rWjnace** categorizes the industries with less granularity using the highest grouping of industries. For more information about the NACE Codes see: www.top500.de/nace4-e.htm. In Wave 2 and forward, baseline respondents and respondents who reported a job change since the last wave were asked to identify their industry by selecting from a list of 14 NACE titles. These 14 titles map to the highest grouping of NACE titles used in Wave 1. The codes are as follows: 1. Agriculture, hunting, forestry, fishing, 2. Mining and quarrying, 3. Manufacturing, 4. Electricity, gas and water supply, 5. Construction, 6. Wholesale and retail trade; repair of motor vehicles, motorcycles and personal and household goods, 7. Hotels and restaurants, 8. Transport, storage and communication, 9. Financial intermediation, 10. Real estate, renting and business activities, 11. Public administration and defense; compulsory social security, 12. Education, 13. Health and social work, 14. Other community, social and personal service activities. **rWjnace** also feeds forward the industry reported in the previous wave for respondents who reported having the same job as they did in the last wave.

In addition to the NACE codes, **rWjnace** also employs several special missing codes. If SHARE was not able to categorize the business/industry into any existing NACE Code, a special missing code of (.o) is used. If the industry reported by the respondent was not applicable, a special missing code of (.a) is used. If the respondent did not know their industries, a special missing code of (.d) is used. If the respondent refused to identify their industries, a special missing code of (.r) is used. If the industry given by the respondent was illegible, a special missing code of (.i) is used. If the respondent did not give an answer when asked for their industries, a special missing code of (.n) is used. If the respondent is not working, a special missing code of (.w) is used. If the longitudinal respondent was working for pay and reported not working consistently since the last wave but did not report a job situation as "Employed or self-employed (including working for family business)", then **rWjnace** is set to a (.q) missing code, meaning they were not asked. In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). Other missing responses are set to (.m). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWjnace indicates the NACE Code for the industry of the respondent's spouse's current job. It is taken from the spouse's **rWjnace**. In addition to the special missing codes employed by **rWjnace**, **sWjnace** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Industry is surveyed in a free response format in Wave 1 and SHARE organized these responses into NACE codes and special missing categories. In Wave 2 and forward, SHARE surveys industry using showcards where the respondent identifies their industries by selecting from a list of NACE titles.

The industry question wording changed significantly between Wave 1 and Wave 2 forward. In Wave 1, for respondents who reported doing any paid work in the last 4 weeks, being only temporarily away from work, or being employed or self-employed the survey asked, "In your main job are you an employee, a civil servant, or self-employed?" If the respondent replies they are employees or civil servants or if the respondents reply they are self-employed, the survey then asked, "What kind of business or industry are you in (that is, what do you make or do at the place where you work)?" In Wave 2 and forward, for respondents who reported doing any paid work in the last 4 weeks, being only temporarily away from work, or being employed or self-employed and who also were either new to the panel, had made a change to their job since the last interview, or had

not worked continuously since the last sample, the survey asked, "Please look at showcard [showcard #]. What kind of business, industry or services do you work in?" The showcard contained the following list of job names/titles: "1. Agriculture, hunting, forestry, fishing, 2. Mining and quarrying, 3. Manufacturing, 4. Electricity, gas and water supply, 5. Construction, 6. Wholesale and retail trade; repair of motor vehicles, motorcycles and personal and household goods, 7. Hotels and restaurants, 8. Transport, storage and communication, 9. Financial intermediation, 10. Real estate, renting and business activities, 11. Public administration and defense; compulsory social security, 12. Education, 13. Health and social work, 14. Other community, social and personal service activities." As is clear, there are significant differences between Wave 1 and Wave 2 forward. In Wave 1, SHARE derives the NACE codes from the free response answers given by the respondent. In Wave 2 and forward, the respondent selected from a list of NACE titles.

Although the NACE codes which SHARE derived in Wave 1 generally map to the NACE codes SHARE provided as answer choices in Wave 2 and forward, there are two exceptions. In Wave 1, SHARE derived NACE codes include two categories which were not included in the following waves' NACE answer choices. These two categories are: Private households with employed persons and Extra-territorial organizations and bodies.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given a regular questionnaire in Wave 7, were asked questions about the name or title of their current job.

Cross-Study Differences with the HRS

The RAND HRS does not categorize industries using the NACE CODES. **rWjnace** is a SHARE specific variable which attempts to capture similar information as **rWjcind** in the RAND HRS.

Year Last Job Ended

Variable	Waves	Label	Type
rWjlasty	1-2, 4-9	rWjlasty:WW r Year Last Worked/not working	Cont
sWjlasty	1-2, 4-9	sWjlasty:WW s Year Last Worked/not working	Cont

How Constructed

Respondents are asked about past jobs retrospectively at their first interview. If they report ever having worked then the year when their most recent job ended is obtained. All respondents who are re-interviewed are asked when their last job ended as well as if they had a paid job since the last interview and if the job reported during the last interview is not the most recent. **rWjlasty** is the year when the respondent's last job ended. If the respondent never worked, **rWjlasty** is set to a (.n) missing code, which is carried forward across waves. It is set to missing value (.w) if the respondent is working at the current wave. It is set to missing value (.i) if the respondents reported a year that was before their birth year. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWjlasty is the year the respondent's spouse last worked. It is taken from the spouse's **rWjlasty**. In addition to the special missing codes employed by **rWjlasty**, **sWjlasty** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, but had not answered baseline questions on demographics in a previous wave, were asked questions about if they ever worked and when their most recent job ended.

Cross-Study Differences with the HRS

Unlike in the RAND HRS, **rWjlasty** in the Gateway Harmonized SHARE does not use the month and year given for retirement, disability, unemployment, and temporary layoff to fill in missing job stop dates.

Continuous Variable Distributions

Variable	N	Mean	Std.Dev	Minimum	Maximum	Total missing

Employed by Government

Variable	Waves	Label	Type
rWjgovtemp	1-2, 4-9	rWjgovtemp:WW whether r employed by government	Categ
sWjgovtemp	1-2, 4-9	sWjgovtemp:WW whether s employed by government	Categ

How Constructed

rWjgovtemp indicates whether the respondent currently works for the government. **rWjgovtemp** is coded as 0 if the respondent reported working for pay, but did not report working for the government. **rWjgovtemp** is coded as 1 if the respondent reported working for the government. In Waves 1 through 4, respondents are asked to identify themselves as an employee, a civil servant, or self-employed in their main job. If the respondent identifies themselves as an employee, they are asked if they are employed in the public sector. In Waves 2 and 4, the values from **rWjgovtemp** are carried forward from the previous wave if the respondent reports continuously working since the previous wave and having the same job. Starting in Wave 5, the respondent is asked to identify themselves as a private sector employee, a public sector employee, or self-employed in their main job in a single question. In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). **rWjgovtemp** is set to special missing code (.w) if the respondent is not working for pay. If the longitudinal respondent was working for pay and reported not working consistently since the last wave but did not report a job situation as "Employed or self-employed (including working for family business)", the **rWjgovtemp** is set to special missing code (.a), meaning they were not asked. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWjgovtemp records whether the respondent's spouse in the current wave is employed by the government. Its value is taken from the spouse's **rWjgovtemp**. In addition to the special missing codes employed by **rWjgovtemp**, **sWjgovtemp** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Waves 1 through 4, respondents are asked to identify themselves as an employee, a civil servant, or self-employed in their main job. If the respondent identifies themselves as an employee, they are asked if they are employed in the public sector. Starting in Wave 5, the respondent is asked to identify themselves as a private sector employee, a public sector employee, or self-employed in their main job in a single question.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about being employed by the government.

Cross-Study Differences with the HRS

Unlike the HRS which asks, "are you employed by the government at the federal, state, or local level?" the SHARE allows respondents to identify themselves as employees, civil servant, or self-employed. If a respondent identifies themselves as an employee, they are asked if they are employed in the public sector. Starting in Wave 5, SHARE allows respondents to identify themselves as private sector employees, public sector employees, or self-employed.

Firm Size

Variable	Waves	Label	Type
rWfsize	1, 7	rWfsize:WW r firm size	Categ
sWfsize	1, 7	sWfsize:WW s firm size	Categ

How Constructed

rWfsize indicates the number of people employed at the firm/company where the respondent usually works, including the respondent. In Wave 1, the question is only asked if the respondent identified themselves as an employee or a civil servant in their main job. The question is not asked in Waves 2 through 6. In Wave 7, the question is only asked if the respondent identified themselves as a private sector employee or a public sector employee in their main job. The question is not asked in Waves 8 and 9. **rWfsize** feeds forward the number of people employed at the firm reported in Wave 1 for respondents who reported having the same job as they did in Wave 1.

In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). If a respondent identified themselves as self-employed, a special missing value of (.s) is used. It is set to missing value (.w) if the respondent is not working at the current wave. In Wave 7, if the longitudinal respondent was working for pay and reported not working consistently since the last wave but did not report a job situation as "Employed or self-employed (including working for family business)", then **rWfsize** is set to missing value (.a), meaning they were not asked. In Wave 7, if the longitudinal respondent was working for pay and reported working consistently since the last wave but had another change of job between Wave 1 and Wave 7, then **rWfsize** is set to missing value (.q), meaning they had a previous job change at a wave in which they were not asked about firm size. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWfsize indicates how many people are employed at the firm where the respondent's spouse usually works, including the spouse. It is taken from the spouse's **rWfsize**. In addition to the special missing codes employed by **rWfsize**, **sWfsize** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 1, the question is only asked if the respondent identified themselves as an employee or a civil servant in their main job. The question is not asked in Waves 2 through 6. In Wave 7, the question is only asked if the respondent identified themselves as a private sector employee or a public sector employee in their main job. The question is not asked in Waves 8 and 9. **rWfsize** feeds forward the number of people employed at the firm reported in Wave 1 for respondents who reported having the same job as they did in Wave 1.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about the number of people employed at the firm/company where the respondent usually works, including the respondent.

Cross-Study Differences with the HRS

No known differences.

Whether or Not Supervise Others

Variable	Waves	Label	Type
rWjsprvs	1-2, 7	rWjsprvs:WW whether r supervises others	Categ
sWjsprvs	1-2, 7	sWjsprvs:WW whether s supervises others	Categ

How Constructed

rWjsprvs indicates whether the respondent has the responsibility to supervise other employees. In Waves 1 and 2, the question is only asked if the respondent identified themselves as an employee or a civil servant in their main job. The question is not asked in Waves 3 through 6. In Wave 7, the question is only asked if the respondent identified themselves as a private sector employee or a public sector employee in their main job. The question is not asked in Waves 8 and 9. **rWjsprvs** feeds forward whether the respondent has the responsibility to supervise other employees for respondents who reported having the same job as they did in the Waves 1 or 2. **rWjsprvs** takes a value of 1 if the respondent reports having the responsibility to supervise other employees and 0 otherwise.

In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). In Waves 1 and 2, if a respondent identified themselves as self-employed, a special missing value of (.s) is used. It is set to missing value (.w) if the respondent is not working at the current wave. If the longitudinal respondent was working for pay and reported not working consistently since the last wave but did not report a job situation as "Employed or self-employed (including working for family business)", then **rWjsprvs** is set to missing code (.a), meaning they were not asked. If the longitudinal respondent was working for pay and reported working consistently since the last wave but had another change of job between Wave 2 and Wave 7, then **rWjsprvs** is set to missing code (.q), meaning they had a previous job change at a wave in which they were not asked whether they supervise others. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWjsprvs indicates whether the respondent's spouse has the responsibility to supervise other employees. It is taken from the spouse's **rWjsprvs**. In addition to the special missing codes employed by **rWjsprvs**, **sWjsprvs** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Waves 1 and 2, the question is only asked if the respondent identified themselves as an employee or a civil servant in their main job. The question is not asked in Waves 3 through 6. In Wave 7, the question is only asked if the respondent identified themselves as a private sector employee or a public sector employee in their main job. The question is not asked in Waves 8 and 9. **rWjsprvs** feeds forward whether the respondent has the responsibility to supervise other employees for respondents who reported having the same job as they did in the Waves 1 or 2.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about the respondent's responsibility to supervise other employees.

Cross-Study Differences with the HRS

The Harmonized HRS has a comparable version of **rWjsprvs**, as well as a variable indicating the number of employees the respondent supervises.

Reason Stopped Working

Variable	Waves	Label	Type
rWjursleft	1-2, 4-9	rWjursleft:ww reason r stopped working	Categ
sWjursleft	1-2, 4-9	sWjursleft:ww reason s stopped working	Categ

How Constructed

rWjursleft indicates how the respondent became unemployed. The question is only asked if the respondent reported being unemployed. Respondents are able to report that they became unemployed "because [their] place of work or office closed", "because [they] resigned", "because [they] were laid off", "by mutual agreement between [them] and [their] employer", "because a temporary job had been completed", "because [they] moved town", or another reason. A code of 1 indicates the respondent became unemployed because their place of work or office closed. A code of 2 indicates the respondent became unemployed because they resigned. A code of 3 indicates the respondent became unemployed because they were laid off. A code of 4 indicates the respondent became unemployed by mutual agreement between the respondent and their employer. A code of 5 indicates the respondent became unemployed because a temporary job had been completed. A code of 6 indicates the respondent became unemployed because they moved towns or because of another reason. In Wave 7, respondents who completed the SHARELIFE Interview and condensed core interview were not asked this question and are assigned special missing value (.c). **rWjursleft** is set to missing value (.w) if the respondent is working at the current wave. If the respondent is not working at the current wave but they do not report being unemployed, special missing value (.q) is used. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent did not participate in the current wave.

sWjursleft records how the respondent's spouse became unemployed. Its value is taken from the spouse's **rWjursleft**. In addition to the special missing codes employed by **rWjursleft**, **sWjursleft** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Starting at Wave 2, "because [they] moved town" was added to the list of possible responses for how the respondent became unemployed.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about being employed by the government.

Cross-Study Differences with the HRS

The Harmonized HRS includes **rWjrsleft**, indicating the respondent's reason for stopping working if they are no longer working, whereas **rWjursleft** in the Gateway Harmonized SHARE indicates the respondent's reason for stopping working only if they are unemployed. **rWjrsleft** in the Harmonized HRS has different answer categories than **rWjursleft** in the Gateway Harmonized SHARE: 1.retired, 3.laid off, 4.health reason, 5.family reason, 6.new job, 7.quit, 8.other.

I. Retirement and Expectations

Whether Retired: Retired Employment Status

Variable	Waves	Label	Type
rWretemp	1-2, 4-9	rWretemp:ww R gives Retired in empstat	Categ
sWretemp	1-2, 4-9	sWretemp:ww S gives Retired in empstat	Categ

How Constructed

rWretemp is derived from current job status. **rWretemp** is set to 1 if the respondent reports a retired status as their current job status. It is set to 0 if the respondent reports being employed or self-employed, unemployed, permanently sick or disabled, a homemaker, or has another job status. For details of current job status, please see "**rWlbrf_s**". When respondents don't know, refuse to answer, or are otherwise missing, **rWretemp** is assigned special missing values (.d), (.r), or (.m), respectively. **rWretemp** is set to plain missing (.) for respondents who did not respond to the current wave.

sWretemp indicates the spouse's retirement status. It is taken from the respondent's spouse's **rWretemp**. In addition to the special missing values used in **rWretemp**, **sWretemp** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

In RAND HRS, the respondent can report a retired status or report being retired in addition to other statuses, such as working, disabled, or unemployed. The code="2.Retire plus other empstat" in **rWretemp** indicates this additional information.

In SHARE, **rWretemp** is simply taking the retirement status from the current job status variable. No additional information is available.

Whether Retired: Retirement Month and Year, if Says Retired

Variable	Waves	Label	Type
rWretyr	1-2, 4-9	rWretyr:wW r Year retired if retired	Cont
sWretyr	1-2, 4-9	sWretyr:wW s Year retired if retired	Cont
rWretmon	2, 4-9	rWretmon:wW r Month retired if retired	Cont
sWretmon	2, 4-9	sWretmon:wW s Month retired if retired	Cont
rWretage	1-2, 4-9	rWretage:wW r Age retired if retired	Cont
sWretage	1-2, 4-9	sWretage:wW s Age retired if retired	Cont

How Constructed

Retirement month and year are derived for respondents who report they are retired, i.e., where **rWretemp** is 1.

rWretyr is the year the respondent retired if the respondent reports they are retired. The source of retirement year varies across waves. In Wave 1, the retirement year is taken only from the year the respondent reported retiring. Starting in Wave 2, if the respondent reports being retired but the retirement year is missing, the respondent's report of the year their last job ended is used to fill in missing values. Starting in Wave 8, the respondent's reported year of retirement or the year their last job ended is carried forward from the most recent wave if the respondent reported retiring in a previous wave and staying retired in the current wave. If the retirement year is earlier than the respondent's birth year, the special missing code (.i) is assigned for invalid values. **rWretyr** is assigned special missing value (.n) if the respondent reports not being retired. Starting in Wave 2, respondents who live in a nursing home are not asked this question and special missing code (.h) is assigned. In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not give information about retirement month and retirement year. When respondents don't know, refuse to answer, or are otherwise missing, **rWretyr** is assigned special missing values (.d), (.r), or (.m), respectively. **rWretyr** is set to plain missing (.) for respondents who did not respond to the current wave.

rWretmon is the month the respondent retired if the respondent reports they are retired. Month of retirement is not asked until Wave 2, so **r1retmon** is not available. In Waves 4 to 7, the retirement month is only asked if the respondent reported a retirement year after 2008. Starting in Wave 8, the respondent's reported month of retirement is carried forward from the most recent wave if the respondent reported retiring in a previous wave and staying retired in the current wave. In Waves 4 to 7, for respondents who report a retirement year of 2008 or earlier, special missing code (.s) is assigned because this question was skipped for these respondents. **rWretmon** is assigned special missing value (.n) if the respondent reports not being retired. Starting in Wave 2, respondents who live in a nursing home are not asked this question and special missing code (.h) is assigned. When respondents don't know, refuse to answer, or are otherwise missing, **rWretmon** is assigned special missing values (.d), (.r), or (.m), respectively. **rWretmon** is set to plain missing (.) for respondents who did not respond to the current wave.

rWretage is the respondent's retirement age. **rWretage** is calculated by subtracting the respondent's birth year and birth month from the reported retirement year and retirement month and rounding down. If birth or retirement month was missing, the month was assumed to be June when subtracting. If both birth month and retirement month were missing, the years were directly subtracted. If the retirement year is earlier than the respondent's birth year, the special missing code (.i) is assigned for invalid values. **rWretage** is assigned special missing value (.n) if the respondent reports not being retired. Starting in Wave 2, respondents who live in a nursing home are not asked their retirement year, so retirement age cannot be calculated, and special missing code (.h) is assigned. In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not give information about retirement month and retirement year. When respondents don't know, refuse to answer, or are otherwise missing, **rWretyr** is assigned special missing values (.d), (.r), or (.m), respectively. **rWretyr** is set to plain missing (.) for respondents who did not respond to the current wave.

sWretmon, **sWretyr**, and **sWretage** indicate the spouse's retirement month, year, and age, respectively. They are taken from the spouse's **rWretmon**, **rWretyr**, **rWretage**. In addition to the special missing values used in **rWretmon**, **rWretyr**, **rWretage**, **sWretmon**, **sWretyr**, and **sWretage** employ two additional special missing codes, (.u) and (.v). A special

missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The source of retirement month and year varies across waves.

In Wave 1, the retirement month was not asked.

Starting in Wave 2, SHARE asks both about the year of retirement and the year last job ended. In the case that the year of retirement is missing for retired respondents, the year last job ended is used in **rWretyr**.

Also starting in Wave 2, SHARE does not ask when the respondent retired if they live in a nursing home.

In Waves 4 to 7, the retirement month is only asked if the respondent reported a retirement year after 2008.

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not give information about retirement month and retirement year.

Starting in Wave 8, the respondent's reported year and month of retirement or the year their last job ended is carried forward from the most recent wave if the respondent reported retiring in a previous wave and staying retired in the current wave.

In Wave 1, the respondent's retirement age is calculated without using retirement month because the retirement month is not available.

Cross-Study Differences with the HRS

In RAND HRS, the retirement month and year are derived for respondents who say they are completely or partially retired.

In SHARE, the retirement month and year are based on retired status from current job status.

Whether Looking for Early Retirement

Variable	Waves	Label	Type
rWretear	1-2, 4-9	rWretear:WW R look for early retirement	Categ
sWretear	1-2, 4-9	sWretear:WW S look for early retirement	Categ

How Constructed

rWretear indicates whether the respondent is looking for early retirement if their current job status is employed or self-employed. **rWretear** is set to 1 if the respondent reports that they would like to retire as early as possible from their current job. It is set to 0 if the respondent does not report wanting early retirement. For those whose current job status is "Retired", "Unemployed", "Permanently sick or disabled", "Homemaker", or "Other", the special missing (.w) is assigned to indicate not working. Starting in Wave 2, respondents who live in a nursing home are not asked this question and special missing code (.h) is assigned. When respondents don't know, refuse to answer, or are otherwise missing, **rWretear** is assigned special missing values (.d), (.r), or (.m), respectively. **rWretear** is set to plain missing (.) for respondents who did not respond to the current wave.

sWretear indicates whether the respondent's spouse is looking for early retirement. It is taken from the spouse's values to **rWretear**. In addition to the special missing values used in **rWretear**, **sWretear** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

No differences known.

Cross-Study Differences with the HRS

This question is not asked in the HRS.

Self-Reported Probability of Working Full-Time After Age 63

Variable	Waves	Label	Type
rWwork63	2, 4-9	rWwork63:wW R prob work ft after 63	Cont
sWwork63	2, 4-9	sWwork63:wW S prob work ft after 63	Cont

How Constructed

rWwork63 indicates the respondent's self-reported probability of working full-time after age 63. **rWwork63** is reported on a scale of 0 to 100. This question is only asked to respondents younger than age 61 who report being employed, so for those who are not asked due to their age, and working status, **rWwork63** is assigned special missing (.a) and (.w), respectively. **rWwork63** is assigned special missing (.p) if this question was skipped because the interview was by proxy. Respondents who live in a nursing home are not asked this question and special missing code (.h) is assigned. In Wave 4 and then starting again in Wave 6, only new respondents were asked this question, so returning respondents are assigned special missing (.s) in these waves. In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not answer this question. In any wave, when respondents don't know, refuse to answer, or are otherwise missing, **rWwork63** is assigned special missing values (.d), (.r), or (.m), respectively. **rWwork63** is set to plain missing (.) for respondents who did not respond to the current wave.

sWwork63 indicates the respondent's spouse's self-reported probability of working full-time after age 63. It is taken from the spouse's values to **rWwork63**. In addition to the special missing values used in **rWwork63**, **sWwork63** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

This question is asked starting in Wave 2.

In Wave 4, only new respondents, and not returning respondents, were asked this question. At Wave 5, both new and returning respondents were asked this question. Then starting again at Wave 6, only new respondents, and not returning respondents, were asked this question.

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not answer this question.

Cross-Study Differences with the HRS

In the RAND HRS, respondents are asked about their probability of working after ages 62 and 65, reported in corresponding variables **rWwork62** and **rWwork65**, respectively. However in SHARE, respondents are asked about their probability of working after age 63, reported in corresponding variable **rWwork63**.

Self-Reported Probability of Change in Standard of Living in 5 Years

Variable	Waves	Label	Type
rWretlivb5	1-2	rWretlivb5:ww R prob better std living 5 yrs	Cont
sWretlivb5	1-2	sWretlivb5:ww S prob better std living 5 yrs	Cont
rWretlivw5	1-2	rWretlivw5:ww R prob worse std living 5 yrs	Cont
sWretlivw5	1-2	sWretlivw5:ww S prob worse std living 5 yrs	Cont

How Constructed

rWretlivb5 indicates the respondent's self-reported probability of their standard of living being better in 5 years than today. **rWretlivb5** is reported on a scale of 0 to 100. **rWretlivb5** is assigned special missing (.p) if this question was skipped because the interview was by proxy. When respondents don't know, refuse to answer, or are otherwise missing, **rWretlivb5** is assigned special missing values (.d), (.r), or (.m), respectively. **rWretlivb5** is set to plain missing (.) for respondents who did not respond to the current wave.

rWretlivw5 indicates the respondent's self-reported probability of their standard of living being worse in 5 years than today. **rWretlivw5** is reported on a scale of 0 to 100. **rWretlivw5** is assigned special missing (.p) if this question was skipped because the interview was by proxy. When respondents don't know, refuse to answer, or are otherwise missing, **rWretlivw5** is assigned special missing values (.d), (.r), or (.m), respectively. **rWretlivw5** is set to plain missing (.) for respondents who did not respond to the current wave.

sWretlivb5 and **sWretlivw5** indicate the respondent's spouse's self-reported probability of their standard of living being better or worse, respectively, in 5 years. They are taken from the spouse's values to **rWretlivb5** and **rWretlivw5**. In addition to the special missing values used in **rWretlivb5** and **rWretlivw5**, **sWretlivb5** and **sWretlivw5** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

These questions are only asked in Waves 1 and 2.

Cross-Study Differences with the HRS

In the RAND HRS, **rWretliv** indicates the respondent's expectations for their standard of living in retirement. However in SHARE, **rWretlivb5** and **rWretlivw5** indicate the respondent's probability of their standard of living being better or worse in 5 years.

Continuous Variable Distributions

Self-Reported Probability of Living to a Specified Age

Variable	Waves	Label	Type
rWliv10	1-2, 4-9	rWliv10:WW R probability to live 75-120	Cont
sWliv10	1-2, 4-9	sWliv10:WW S probability to live 75-120	Cont
rWliv10a	1-2, 4-9	rWliv10a:WW R age used in live 75-120	Cont
sWliv10a	1-2, 4-9	sWliv10a:WW S age used in live 75-120	Cont

How Constructed

rWliv10 indicates the respondent's self-reported probability of living to a specified age. **rWliv10** is reported on a scale of 0 to 100. **rWliv10a** indicates the age used in the probability question. **rWliv10** is assigned special missing (.p) if this question was skipped because the interview was by proxy. In Wave 4, only new respondents were asked this question, so returning respondents are assigned special missing (.s) in Wave 4. In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not answer this question. In all waves, when respondents don't know, refuse to answer, or are otherwise missing, **rWliv10** and **rWliv10a** are assigned special missing values (.d), (.r), or (.m), respectively. **rWliv10** and **rWliv10a** are set to plain missing (.) for respondents who did not respond to the current wave.

sWliv10 and **sWliv10a** indicate the respondent's spouse's self-reported probability of living to a specified age and the age used, respectively. They are taken from the spouse's values to **rWliv10** and **rWliv10a**. In addition to the special missing values used in **rWliv10** and **rWliv10a**, **sWliv10** and **sWliv10a** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 4, only new respondents, and not returning respondents, were asked this question.

In Wave 7, if the respondent was not given the regular SHARE Wave 7 questionnaire, but rather was given the SHARELIFE questionnaire, they did not answer this question.

Cross-Study Differences with the HRS

In the RAND HRS, the ages used for **rWliv10** range from 80 to 100 years of age. However in Gateway Harmonized SHARE, the ages used for **rWliv10** range from 75 to 120 years of age.

Continuous Variable Distributions

Self-Reported Probability of Receiving an Inheritance in the Next 10 Years

Variable	Waves	Label	Type
rWinher	1-2, 4	rWinher:WW R prob receive inheritance next 10 yr	Cont
sWinher	1-2, 4	sWinher:WW S prob receive inheritance next 10 yr	Cont

How Constructed

rWinher indicates the respondent's self-reported probability of receiving an inheritance in the next 10 years. **rWinher** is reported on a scale of 0 to 100. **rWinher** is assigned special missing (.p) if this question was skipped because the interview was by proxy. In Wave 4, only new respondents were asked this question, so returning respondents are assigned special missing (.s) in Wave 4. In any wave, when respondents don't know, refuse to answer, or are otherwise missing, **rWinher** is assigned special missing values (.d), (.r), or (.m), respectively. **rWinher** is set to plain missing (.) for respondents who did not respond to the current wave.

sWinher indicates the respondent's spouse's self-reported probability of receiving an inheritance in the next 10 years. They are taken from the spouse's values to **rWinher**. In addition to the special missing values used in **rWinher**, **sWinher** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 4, only new respondents, and not returning respondents, were asked this question.

This question is not asked starting in Wave 5.

Cross-Study Differences with the HRS

No differences known.

Self-Reported Probability of Leaving an Inheritance in the Next 10 Years

Variable	Waves	Label	Type
rWbeq50p	1-2	rWbeq50p:wW R prob leave bequest 50k+ euro	Cont
sWbeq50p	1-2	sWbeq50p:wW S prob leave bequest 50k+ euro	Cont
rWbeq150p	1-2	rWbeq150p:wW R prob leave bequest 150k+ euro	Cont
sWbeq150p	1-2	sWbeq150p:wW S prob leave bequest 150k+ euro	Cont
rWbeqany	1-2	rWbeqany:wW R prob leave bequest any	Cont
sWbeqany	1-2	sWbeqany:wW S prob leave bequest any	Cont

How Constructed

Respondents are first asked about the probability of leaving an inheritance of 50,000+ Euro. If their self-reported probability of leaving 50,000+ Euro is greater than 0, then respondents are asked the probability of leaving an inheritance of 150,000+ Euro. If their self-reported probability of leaving 50,000+ Euro is 0, then respondents are asked the probability of leaving any inheritance. **rWbeq50p** indicates the respondent's self-reported probability of leaving an inheritance of 50,000+ Euro. **rWbeq150p** indicates the respondent's self-reported probability of leaving an inheritance of 150,000+ Euro. In the case that the respondent reported a 0 probability of leaving 50,000+ Euro a value of 0 is assigned to **rWbeq150p**. **rWbeqany** indicates the respondent's self-reported probability of leaving any inheritance, this question is only asked to respondents whose self-reported probability of leaving 50,000+ Euro was 0. **rWbeq50p**, **rWbeq150p**, and **rWbeqany** are reported on a scale of 0 to 100. **rWbeqany** is assigned special missing (.s) if the respondent was not asked the question because their self-reported probability of leaving 50,000+ Euro is greater than 0. **rWbeq50p**, **rWbeq150p**, and **rWbeqany** are assigned special missing (.p) if these questions were skipped because the interview was by proxy. When respondents don't know, refuse to answer, or are otherwise missing, **rWbeq50p**, **rWbeq150p**, and **rWbeqany** are assigned special missing values (.d), (.r), or (.m), respectively. These variables are set to plain missing (.) for respondents who did not respond to the current wave.

sWbeq50p, **sWbeq150p**, and **sWbeqany** indicate the respondent's spouse's self-reported probability of leaving an inheritance of 50,000+ Euro, 150,000+ Euro, or any inheritance, respectively. They are taken from the spouse's values to **rWbeq50p**, **rWbeq150p**, and **rWbeqany**. In addition to the special missing values used in **rWbeq50p**, **rWbeq150p**, and **rWbeqany**, **sWbeq50p**, **sWbeq150p**, and **sWbeqany** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

These questions are only asked in Waves 1 and 2.

Cross-Study Differences with the HRS

In the HRS, respondents are asked about the probability of leaving \$10,000, \$100,000, or any inheritance, as reported in **rWbeq10k**, **rWbeq100**, and **rWbeqany**. However in SHARE, respondents are asked about the probability of leaving 50,000 Euro, 150,000 Euro, or any inheritance, as reported in **rWbeq50p**, **rWbeq150p**, and **rWbeqany**.

Please note, that the questions in the HRS are asked in dollars, whereas the questions in SHARE are asked in Euro.

J. Pension

Currently Receiving Any Public Pension

Variable	Waves	Label	Type
rWpubpen	1-2, 4-9	rWpubpen:WW whether r receives public pensions	Categ
sWpubpen	1-2, 4-9	sWpubpen:WW whether s receives public pensions	Categ

How Constructed

rWpubpen indicates whether the respondent is currently receiving a public pension not including disability pensions. SHARE provides a country-specific composition of pension variables, with the variables **ypen1** and **ylsp1** representing the public pension regular payments and lump sums, respectively. The variables used to comprise **ypen1** and **ylsp1** are the ones used to indicate whether or not the respondent is currently receiving a public pension. In Wave 1, **ypen1** is composed of public old age pension, public early retirement pension, public survivor pension, and war pension, while **ylsp1** is not calculated. In Waves 2 and forward, **ypen1** and **ylsp1** are composed of public old age pension, public old age supplementary pension, public early retirement pension, main public survivor pension, secondary public survivor pension, and public war pension. For more information on the variables comprising public pension without disability, please refer to "Section F. Income: Public Pension Income" or the "SHARE: Release Guide 9.0.0 of Wave 9". A value of 0 indicates that the respondent is not receiving a regular payment or lump sum payment from any of the pensions comprising the wave-specific public pension. A value of 1 indicates that the respondent is receiving a regular payment or lump sum payment from at least one of the pensions comprising the wave-specific public pension. Don't know, refused, or other missing responses of **rWpubpen** are assigned special missing codes (.d), (.r), (.m), respectively. **rWpubpen** is set to plain missing (.) for respondents who did not respond to the current wave.

sWpubpen indicates whether the current wave's spouse is currently receiving a public pension, and is taken from the spouse's values to **rWpubpen**. In addition to the special missing codes used in **rWpubpen**, **sWpubpen** employs two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Please note that respondents are asked about a single public old age pension and single public survivor pension in Wave 1, and about a main and supplementary public old age pension and public survivor pension beginning in Wave 2.

There are several country-specific aberrations that are described in "SHARE: Release Guide 9.0.0 of Wave 9" and on the SHARE website (<https://share-eric.eu/data/data-documentation/questionnaires/cross-wave-comparison>). In Wave 1, the Netherlands, France, and Sweden have different component variables of **ypen1**. In Waves 2 and 4, the Netherlands and France have different component variables of **ypen1** and **ylsp1**. In Wave 5, the Netherlands, France, and Luxembourg have different component variables of **ypen1** and **ylsp1**. Starting in Wave 6, Sweden, Poland, and Luxembourg have different component variables of **ypen1** and **ylsp1**.

Cross-Study Differences with the HRS

rWpubpen in the SHARE is comparable to **rassrecv** in the RAND HRS. While **rWpubpen** indicates whether the respondent to SHARE is receiving a public pension at each wave, **rassrecv** indicates whether the respondent to HRS received social security income at any wave. Please note that SHARE has a value for each wave of the study, while the HRS has a single value that encompasses all waves.

Components included in Gateway Harmonized SHARE and RAND HRS are slightly different for public pensions representing different institutional arrangements in each country. However, we kept the concepts included as comparable as possible.

Age Started Receiving Public Pension

Variable	Waves	Label	Type
rWpubage	1-2, 4-9	rWpubage:ww age r started to receive public pensions	Cont
sWpubage	1-2, 4-9	sWpubage:ww age s started to receive public pensions	Cont

How Constructed

rWpubage indicates the respondent's age when they started to receive their current public pension. **rWpubage** includes the age the respondent started to receive regular payments or lump sum payments from public old age, public old age supplementary, public early retirement, main public survivor, secondary public survivor, or public war pensions. At Waves 1, 2, 4, and 5, the year the respondent first started to receive any public pensions which they are currently receiving is only asked to baseline respondents. Starting at Wave 6, the year the respondent first started to receive any public pensions which they are currently receiving is asked to baseline respondents, and the year the respondent first started to receive any new public pensions which they reported starting to receive between the last interview and the current is asked to follow-up respondents. Age is calculated based on the respondent's report of the year they first received a public pension and their reported birth year. If the respondent reported receiving multiple public pensions, the earliest date of all the pensions received was used to calculate **rWpubage**. Reports of the age the respondent started to receive the public pension is carried forward from previous waves if the respondent had already started receiving a public pension in the previous wave. Respondents who are not currently receiving a public pension are assigned special missing (.n). Respondents who report a year later than the interview year for the pension they have already started to receive are assigned special missing (.i) as these are considered invalid responses. **rWpubage** is also set to special missing (.i) if the respondent reports starting to receive a public pension in a year prior to their reported birth year. **rWpubage** is assigned special missing (.q) if the follow-up respondent was not receiving a pension at their baseline interview but they are receiving a pension at the current wave and they started to receive this pension at Waves 2, 4, or 5 so they were not asked the time at which they started to receive it. Individual researchers could infer the timing in these cases because the respondent is observed both before and after starting to receive the pension, but no assumptions as to which year would be appropriate to assign have been made in **rWpubage**. In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about age started to receive public pension. Don't know, refused, or other missing responses of **rWpubage** are assigned special missing codes (.d), (.r), (.m), respectively. **rWpubage** is set to plain missing (.) for respondents who did not respond to the current wave.

sWpubage indicates the current wave's spouse's age when they started to receive their current public pension, and is taken from the spouse's values to **rWpubage**. In addition to the special missing codes used in **rWpubage**, **sWpubage** employs two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Please note that respondents are asked about a single public old age pension and single public survivor pension in Wave 1, and about a main and supplementary public old age pension and public survivor pension beginning in Wave 2.

There are several country-specific aberrations that are described in "SHARE: Release Guide 9.0.0 of Wave 9" and on the SHARE website (<https://share-eric.eu/data/data-documentation/questionnaires/cross-wave-comparison>). In Wave 1, the Netherlands, Sweden, and France have different component variables of **ypen1**. In Waves 2 and 4, the Netherlands and France have different component variables of **ypen1** and **ylsp1**. In Wave 5, the Netherlands, Luxembourg, and France have different component variables of **ypen1** and **ylsp1**. Starting in Wave 6, Sweden, Poland, and Luxembourg have different component variables of **ypen1** and **ylsp1**.

At Waves 1, 2, 4, and 5, the year the respondent first started to receive any public pensions they are currently receiving is only asked to baseline respondents. Starting at Wave 6, the year the respondent first started to receive any public pensions they are currently receiving is asked to baseline respondents and the year the respondent first started to receive any new public pensions they reported starting to receive between the last interview and the current is asked to follow-up respondents.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview) were asked questions about age started to receive public pension.

Cross-Study Differences with the HRS

rWpenage in the SHARE is comparable to **rassageb** in the RAND HRS. Please note that SHARE has a value for each wave of the study, while the HRS has a single value that encompasses all waves.

Additionally, the HRS asks respondents about the single age they began receiving Social Security, while SHARE asks what year the respondent began receiving each old-age or survivor pension, and the earliest year reported is used to calculate **rWpenage** for SHARE.

Continuous Variable Distributions

Currently Receiving Any Private Pension

Variable	Waves	Label	Type
rWpeninc	1-2, 4-9	rWpeninc:WW whether r receives private pensions	Categ
sWpeninc	1-2, 4-9	sWpeninc:WW whether s receives private pensions	Categ

How Constructed

rWpeninc indicates whether the respondent is currently receiving any private or occupational pension. SHARE provides a country-specific composition of pension variables, with the variables **ypen2** and **y1sp2** representing the private pension regular payments and lump sums, respectively. The variables used to comprise **ypen2** and **y1sp2** are the ones used to indicate whether or not the respondent is currently receiving a private pension. In Wave 1, **ypen2** is composed of private old age pension, private early retirement pension, private disability insurance, and private survivor pension, while **y1sp2** is not calculated. In Waves 2 and forward, **ypen2** and **y1sp2** are composed of occupational old age pension from last job, a second job, and a third job (or former jobs rather than a second or third job in Wave 6), occupational early retirement pension, occupational disability insurance, and occupational survivor pension. For more information on the variables comprising private/occupational pension, please refer to "Section F. Income: Private Pension Income" or the "SHARE: Release Guide 9.O.O of Wave 9". A value of 0 indicates that the respondent is not currently receiving any private pension. A value of 0 indicates that the respondent is not receiving a regular payment or lump sum payment from any of the pensions comprising the wave-specific private pension. A value of 1 indicates that the respondent is currently receiving a regular payment or lump sum payment from at least one of the pensions comprising the wave-specific private pension. In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about private pension. Don't know, refused, or other missing responses of **rWpeninc** are assigned special missing codes (.d), (.r), (.m), respectively. **rWpeninc** is set to plain missing (.) for respondents who did not respond to the current wave.

sWpeninc indicates whether the current wave's spouse is currently receiving any private or occupational pension, and is taken from the spouse's values to **rWpeninc**. In addition to the special missing codes used in **rWpeninc**, **sWpeninc** employs two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Please note that respondents are asked about a single occupational old age pension in Wave 1, and about an occupational old age pension from the last job, a second job, and a third job (or former jobs in Wave 6), beginning in Wave 2.

There are several country-specific aberrations that are described in "SHARE: Release Guide 9.O.O of Wave 9" and on the SHARE website (<https://share-eric.eu/data/data-documentation/questionnaires/cross-wave-comparison>). In Wave 1, Sweden and France have different component variables of **ypen2**. In Waves 2 and 4, the Netherlands and France have different component variables of **ypen2** and **y1sp2**. In Wave 5, the Netherlands, France, and Luxembourg have different component variables of **ypen2** and **y1sp2**. Starting in Wave 6, Sweden, Poland, and Luxembourg have different component variables of **ypen2** and **y1sp2**.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview) were asked questions about private pension.

Cross-Study Differences with the HRS

Components included in Gateway Harmonized SHARE and RAND HRS are slightly different for private pensions representing different institutional arrangements in each country. However, we kept the concepts included as comparable as possible.

How Constructed

rWwspeed1 and **rWwspeed2** indicate the number of seconds for the respondent's first and second walk across a span of 2.5 meters. **rWwspeed** indicates the average number of seconds for the respondent's first and second walk. Special missing (.x) is assigned if the respondent tried to do the test but was unable to complete it. Special missing (.n) is assigned if the respondent was asked to take part in the walking tests but did not complete the measurements because the respondent was unwilling to do it, did not feel it was safe, or there was no suitable space to conduct the test. Special missing (.s) is assigned if the respondent was not asked to take part in the walking tests because the respondent was unable to walk alone at the time of the interview, or was under the age of 76 in Wave 1 or was under the age of 75 in Wave 2. The respondent is considered unable to walk alone if: (1) the interviewer observed the respondent walk with the help of another person or using support, (2) the interviewer did not observe them walk because the respondent was in a wheelchair, bed bound, or the interviewer was uncertain if the respondent had an impairment, (3) the respondent reported that they could not walk alone without holding on to another person, (4) the respondent reported that they could walk alone but a necessary walking aid (walking stick or other aid) was unavailable, (5) the respondent reported problems from a recent surgery, injury, or other health condition that might prevent them from walking. Special missing (.p) is assigned if the respondent's interview was completed by proxy and the walking speed test was not completed. Don't know, refuse, and other missing responses to **rWwspeed1**, **rWwspeed2**, and **rWwspeed** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWwspeed1, **sWwspeed2**, and **sWwspeed** indicate the number of seconds for the respondent's current wave's spouse's first, second, and average walks, and their values are taken from the spouse's values to **rWwspeed1**, **rWwspeed2**, and **rWwspeed**. In addition to the special missing codes employed by **rWwspeed1**, **rWwspeed2**, and **rWwspeed**, **sWwspeed1**, **sWwspeed2**, and **sWwspeed** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWwalkcomp indicates whether the respondent was willing and able to complete the walking speed tests. **rWwalkcomp** is coded as 1 if the respondent could safely walk alone and completed at least one of the walking speed tests. **rWwalkcomp** is coded as 0 if the respondent was asked to take part in the walking tests but did not choose to participate, or tried but failed to complete both of the walking speed tests. Special missing (.s) is assigned if the respondent was not asked to take part in the walking tests because the respondent was unable to walk alone at the time of the interview, or was under the age of 76 in Wave 1 or was under the age of 75 in Wave 2. Special missing (.p) is assigned if the respondent's interview was completed by proxy and the walking speed test was not completed. Don't know, refuse, and other missing responses to **rWwalkcomp**

are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWwalkcomp indicates whether the respondent's current wave's spouse was willing and able to complete the walking speed tests, and its values are taken from the spouse's values to **rWwalkcomp**. In addition to the special missing codes employed by **rWwalkcomp**, **sWwalkcomp** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWwalkflr indicates the type of floor the respondent's walking speed tests took place on. **rWwalkflr** is coded as follows: 1.linoleum/tile/wood, 2.low-pile carpet, 3.thick-pile carpet, 4.concrete, 5.other. Special missing (.n) is assigned if the respondent was asked to take part in the walking tests but did not complete the measurements because the respondent was unwilling to do it, did not feel it was safe, or there was no suitable space to conduct the test. Special missing (.s) is assigned if the respondent was not asked to take part in the walking tests because the respondent was unable to walk alone at the time of the interview, or was under the age of 76 in Wave 1 or was under the age of 75 in Wave 2. Special missing (.p) is assigned if the respondent's interview was completed by proxy and the walking speed test was not completed. Don't know or not sure, refuse, and other missing responses to **rWwalkflr** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWwalkflr indicates the type of floor the respondent's current wave's spouse's walking speed tests took place on, and its values are taken from the spouse's values to **rWwalkflr**. In addition to the special missing codes employed by **rWwalkflr**, **sWwalkflr** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWwalkaid indicates the type of walking aid the respondent used during the walking speed tests. **rWwalkaid** is coded as follows: 1.none, 2.walking stick/cane, 3.elbow crutches, 4.walking frame, 5.other. Special missing (.n) is assigned if the respondent was asked to take part in the walking tests but did not complete the measurements because the respondent was unwilling to do it, did not feel it was safe, or there was no suitable space to conduct the test. Special missing (.s) is assigned if the respondent was not asked to take part in the walking tests because the respondent was unable to walk alone at the time of the interview, or was under the age of 76 in Wave 1 or was under the age of 75 in Wave 2. Special missing (.p) is assigned if the respondent's interview was completed by proxy and the walking speed test was not completed. Don't know, refuse, and other missing responses to **rWwalkaid** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWwalkaid indicates the type of walking aid the respondent's current wave's spouse used during the walking speed tests, and its values are taken from the spouse's values to **rWwalkaid**. In addition to the special missing codes employed by **rWwalkaid**, **sWwalkaid** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The walking speed tests were only conducted in Waves 1 and 2.

In Wave 1, respondents up to age 75 were not asked to participate in the walking speed tests. In Wave 2, respondents up to age 74 were not asked to participate in the walking speed tests.

Cross-Study Differences with the HRS

The HRS conducts walking speed tests on respondents aged 65 and older, whereas the SHARE conducts walking speed tests on respondents around age 75 and older. Additionally, the HRS only asks respondents taking part in the enhanced face-to-face interview to take part in the walking speed tests, while the SHARE does not have a similar restriction.

The HRS walking speed tests cover a span of 12 feet, while the SHARE walking speed tests cover a span of 2.5 meters (around 8.2 feet).

The walking speed tests are only available in Waves 1 and 2 of the SHARE, whereas they are available in more waves of the HRS.

How Constructed

rWdomhand indicates the respondent's dominant hand. **rWdomhand** is coded as follows: 1.right hand, 2.left hand, 3.am-bidextrous, meaning both hands are equally dominant. Special missing (.n) is assigned if the respondent was not willing to participate or was unable to use one or both hands. Special missing (.p) is assigned if the interview was completed by proxy and the grip strength tests were not completed. In Wave 3, the proxy assignment is based on a variable at the beginning of the SHARELIFE questionnaire indicating that only a proxy will answer the questionnaire. In Wave 6, the proxy assignment is based on a response indicating that it was a proxy interview when the respondent was asked if they were willing to participate in the grip strength test. In all other waves, the proxy assignment is based on **rWproxy** in the Gateway Harmonized SHARE if the proxy answered some or all of the modules. In Wave 6, the proxy assignment is based on a response indicating that it was a proxy interview when the respondent was asked if they were willing to participate in the grip strength test. Don't know, refuse, and other missing responses to **rWdomhand** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWdomhand indicates the respondent's current wave's spouse's dominant hand, and its values are taken from the spouse's values to **rWdomhand**. In addition to the special missing codes employed by **rWdomhand**, **sWdomhand** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being

coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWlgrip1, **rWlgrip2**, **rWrgrip1**, and **rWrgrip2** indicate the respondent's first and second hand strength measurements for the left and right hand, respectively. **rWlgrip** and **rWrgrip** indicate the respondent's maximum hand strength measurement for the left and right hand, respectively. **rWgripsum** indicates the maximum measurement of the dominant hand, as such, **rWlgrip** is used for respondents with a dominant left hand, and **rWrgrip** is used for respondents with a dominant right hand. For ambidextrous respondents, the maximum value between **rWlgrip** and **rWrgrip** is used. Special missing (.l) is used in **rWlgrip1**, **rWlgrip2**, **rWlgrip**, and **rWgripsum** if the respondent was unable to use their left hand. Special missing (.t) is used in **rWrgrip1**, **rWrgrip2**, **rWrgrip**, and **rWgripsum** if the respondent was unable to use their right hand. Special missing (.n) is assigned if the respondent was not willing to participate or was unable to use both hands. Special missing (.p) is assigned if the interview was completed by proxy and the grip strength tests were not completed. Don't know, refuse, and other missing responses to **rWlgrip1**, **rWlgrip2**, **rWrgrip1**, **rWrgrip2**, **rWlgrip**, **rWrgrip**, and **rWgripsum** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWlgrip1, **sWlgrip2**, **sWrgrip1**, **sWrgrip2**, **sWlgrip**, **sWrgrip**, and **sWgripsum** indicate the respondent's current wave's spouse's first, second, and maximum hand strength measurements for the left and right hand, and the maximum for the dominant hand, and their values are taken from the spouse's values to **rWlgrip1**, **rWlgrip2**, **rWrgrip1**, **rWrgrip2**, **rWlgrip**, **rWrgrip**, and **rWgripsum**. In addition to the special missing codes employed by **rWlgrip1**, **rWlgrip2**, **rWrgrip1**, **rWrgrip2**, **rWlgrip**, **rWrgrip**, and **rWgripsum**, **sWlgrip1**, **sWlgrip2**, **sWrgrip1**, **sWrgrip2**, **sWlgrip**, **sWrgrip**, and **sWgripsum** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgripcomp indicates whether the respondent was willing and able to complete the grip strength test. **rWgripcomp** is coded as 1 if the respondent was able to use at least one hand and completed at least one grip strength measurement. **rWgripcomp** is coded as 0 if the respondent was asked to take part in the grip strength tests but did not choose to or was unable to use both hands. Special missing (.p) is assigned if the interview was completed by proxy and the grip strength tests were not completed. Don't know, refuse, and other missing responses to **rWgripcomp** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWgripcomp indicates whether the respondent's current wave's spouse was willing and able to complete the grip strength test, and its values are taken from the spouse's values to **rWgripcomp**. In addition to the special missing codes employed by **rWgripcomp**, **sWgripcomp** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgrippos indicates the respondent's position during the grip strength test. **rWgrippos** is coded as follows: 1.standing, 2.sitting, 3.lying down. Special missing (.n) is assigned if the respondent was not willing to participate or was unable to use both hands. Special missing (.p) is assigned if the interview was completed by proxy and the grip strength tests were not completed. Don't know, refuse, and other missing responses to **rWgrippos** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWgrippos indicates the respondent's current wave's spouse's position during the grip strength test, and its values are taken from the spouse's values to **rWgrippos**. In addition to the special missing codes employed by **rWgrippos**, **sWgrippos** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgripستا indicates whether the respondent rested their arms on a support during the grip strength test. **rWgripستا** is coded as 0 if the respondent did not rest their arms on a support during the grip strength test, and is coded as 1 if the respondent did rest their arms on a support. Special missing (.n) is assigned if the respondent was not willing to participate or was unable to use both hands. Special missing (.p) is assigned if the interview was completed by proxy and the grip strength tests were not completed. Don't know, refuse, and other missing responses to **rWgripستا** are set to special missing (.d),

(.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWgripsta indicates whether the respondent's current wave's spouse rested their arms on a support during the grip strength test, and its values are taken from the spouse's values to **rWgripsta**. In addition to the special missing codes employed by **rWgripsta**, **sWgripsta** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgripeff indicates how much effort the interviewer reports the respondent using during the grip strength test. **rWgripeff** is coded as follows: 1.respondent gave full effort, 2.respondent was prevented from giving full effort by illness, pain, or other symptoms or discomforts, 3.respondent did not appear to give full effort, but no obvious reason for this. Special missing (.n) is assigned if the respondent was not willing to participate or was unable to use both hands. Special missing (.p) is assigned if the interview was completed by proxy and the grip strength tests were not completed. Don't know, refuse, and other missing responses to **rWgripeff** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWgripeff indicates how much effort the interviewer reports the respondent's current wave's spouse using during the grip strength test, and its values are taken from the spouse's values to **rWgripeff**. In addition to the special missing codes employed by **rWgripeff**, **sWgripeff** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Questions about the respondent's position, resting arms on a support, and the amount of effort are not asked at all in Wave 1. These questions begin in Wave 2.

In Wave 3 and starting in Wave 5, respondents whose interview was completed by proxy were not asked to take part in the grip strength test. In Wave 3, the proxy assignment for these variables is based on a variable at the beginning of the SHARELIFE questionnaire indicating that only a proxy will answer the questionnaire. In Wave 6, the proxy assignment is based on a response indicating that it was a proxy interview when the respondent was asked if they were willing to participate in the grip strength test. In all other waves, the proxy assignment is based on **rWproxy** in the Gateway Harmonized SHARE if the proxy answered some or all of the modules.

In Waves 1 through 5, the respondent can only report a right or left dominant hand. Starting in Wave 6, the respondent can also report that they are ambidextrous.

Cross-Study Differences with the HRS

The HRS only asks respondents taking part in the enhanced face-to-face interview to take part in the grip strength tests, while the SHARE does not have a similar restriction.

The grip strength tests are available in every wave of the SHARE, while they are only available starting in Wave 7 of the HRS.

rWgriptryu	2-9	rWgriptryu:WW r didn't complete grip: tried but unable	Categ
sWgriptryu	2-9	sWgriptryu:WW s didn't complete grip: tried but unable	Categ
rWgripothr	2-9	rWgripothr:WW r didn't complete grip: other reason	Categ
sWgripothr	2-9	sWgripothr:WW s didn't complete grip: other reason	Categ

How Constructed

rWgripsft, **rWgripref**, **rWgriptryu**, and **rWgripothr** indicate the reasons for the respondent not taking part in the grip strength test as reported by the interviewer. The interviewer is asked to report all of the reasons the respondent did not complete the grip strength test. **rWgripsft** indicates whether the respondent did not participate in the grip strength test because the respondent or the interviewer felt it would not be safe or because the respondent had surgery, injury, swelling, etc. on both hands in the past 6 months. **rWgripref** indicates whether the respondent did not participate in the grip strength test because they refused, with no reason given. **rWgriptryu** indicates whether the respondent did not participate in the grip strength test because they tried but were unable to complete the test. **rWgripothr** indicates whether the respondent did not participate in the grip strength test because they did not understand the instructions, or for another reason. **rWgripsft**, **rWgripref**, **rWgriptryu**, and **rWgripothr** are coded as 0 if the specific reason was not given for the respondent not completing the grip strength test, and are coded as 1 if the specific reason was given. Special missing (.c) is assigned if the respondent completed at least one of the grip strength tests. Special missing (.p) is assigned if the interview was completed by proxy and the grip strength tests were not completed. Don't know, refuse, and other missing responses to **rWgripsft**, **rWgripref**, **rWgriptryu**, and **rWgripothr** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWgripsft, **sWgripref**, **sWgriptryu**, and **sWgripothr** indicate the reasons for the respondent's current wave's spouse not taking part in the grip strength test, and their values are taken from the spouse's values to **rWgripsft**, **rWgripref**, **rWgriptryu**, and **rWgripothr**. In addition to the special missing codes employed by **rWgripsft**, **rWgripref**, **rWgriptryu**, and **rWgripothr**, **sWgripsft**, **sWgripref**, **sWgriptryu**, and **sWgripothr** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The question asking about why the respondent did not complete the grip strength test are not asked at all in Wave 1. This question begins in Wave 2.

In Wave 3 and starting in Wave 5, respondents whose interview was completed by proxy were not asked to take part in the grip strength test. In Wave 3, the proxy assignment for these variables is based on a variable at the beginning of the SHARELIFE questionnaire indicating that only a proxy will answer the questionnaire. In Wave 6, the proxy assignment is based on a response indicating that it was a proxy interview when the respondent was asked if they were willing to participate in the grip strength test. In all other waves, the proxy assignment is based on **rWproxy** in the Gateway Harmonized SHARE if the proxy answered some or all of the modules.

Cross-Study Differences with the HRS

The HRS only asks respondents taking part in the enhanced face-to-face interview to take part in the grip strength tests, while the SHARE does not have a similar restriction.

The grip strength tests are available in every wave of the SHARE, while they are only available starting in Wave 7 of the HRS.

The Harmonized HRS also includes **rwgripeq**, which indicates whether the respondent did not complete the grip strength test because of a problem with the equipment or supplies.

sWpuffeff	2, 4, 6	sWpuffeff:ww amount effort s gave to lung function test	Categ

How Constructed

rWpuff1 and **rWpuff2** indicate the respondent's first and second breathing test results. **rWpuff** indicates the respondent's maximum breathing test measurement. **rWpuff1**, **rWpuff2**, and **rWpuff** are assigned a value of 30 if the measurement was less than 60, and a value of 890 if the measurement went past the last tick mark. Special missing (.x) is assigned if the respondent tried to do the test but was unable to complete it. Special missing (.n) is assigned if the respondent did not feel it was safe to do the test or chose not to do it. Special missing (.p) is assigned if the interview was completed by proxy and the lung function tests were not completed. In Wave 6, the proxy assignment is based on a response indicating that it was a proxy interview when the respondent was asked if they were willing to participate in the breathing test. Don't know, refuse, and other missing responses to **rWpuff1**, **rWpuff2**, and **rWpuff** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWpuff1, **sWpuff2**, and **sWpuff** indicate the respondent's current wave's spouse's first, second, and maximum breathing test results, and their values are taken from the spouse's values to **rWpuff1**, **rWpuff2**, and **rWpuff**. In addition to the special missing codes employed by **rWpuff1**, **rWpuff2**, and **rWpuff**, **sWpuff1**, **sWpuff2**, and **sWpuff** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWpuffcomp indicates whether the respondent was willing and able to complete the breathing test. **rWpuffcomp** is coded as 1 if the respondent was able to complete at least one breathing test measurement. **rWpuffcomp** is coded as 0 if the respondent was asked to take part in the breathing tests but did not choose to, was unable to participate, or was unable to complete the test. Special missing (.p) is assigned if the interview was completed by proxy and the lung function tests were not completed. Don't know, refuse, and other missing responses to **rWpuffcomp** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWpuffcomp indicates whether the respondent's current wave's spouse was willing and able to complete the breathing test, and its values are taken from the spouse's values to **rWpuffcomp**. In addition to the special missing codes employed by **rWpuffcomp**, **sWpuffcomp** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWpuffpos indicates the respondent's position during the breathing test. **rWpuffpos** is coded as follows: 1.standing, 2.sitting, 3.lying down. Special missing (.n) is assigned if the respondent did not feel it was safe to do the test or chose

not to do it. Special missing (.p) is assigned if the interview was completed by proxy and the lung function tests were not completed. Don't know, refuse, and other missing responses to **rWpuffpos** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWpuffpos indicates the respondent's current wave's spouse's position during the breathing test, and its values are taken from the spouse's values to **rWpuffpos**. In addition to the special missing codes employed by **rWpuffpos**, **sWpuffpos** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWpuffeff indicates how much effort the interviewer reports the respondent using during the breathing test. **rWpuffeff** is coded as follows: 1.respondent gave full effort, 2.respondent was prevented from giving full effort by illness, pain, or other symptoms or discomforts, 3.respondent did not appear to give full effort, but no obvious reason for this. Special missing (.n) is assigned if the respondent did not feel it was safe to do the test or chose not to do it. Special missing (.p) is assigned if the interview was completed by proxy and the lung function tests were not completed. Don't know, refuse, and other missing responses to **rWpuffeff** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWpuffeff indicates how much effort the interviewer reports the respondent's current wave's spouse using during the breathing test, and its values are taken from the spouse's values to **rWpuffeff**. In addition to the special missing codes employed by **rWpuffeff**, **sWpuffeff** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The breathing test is conducted in Waves 2, 4 and 6, and is not conducted in Waves 1, 3, 5, and starting in Wave 7.

In Wave 6, respondents whose interview was completed by proxy were not asked to take part in the breathing test. In Wave 6, the proxy assignment is based on a response indicating that it was a proxy interview when the respondent was asked if they were willing to participate in the breathing test.

Cross-Study Differences with the HRS

The HRS only asks respondents taking part in the enhanced face-to-face interview to take part in the breathing tests, while the SHARE does not have a similar restriction.

The breathing tests are available in every wave since Wave 7 of the HRS, while they are only available in Waves 2, 4, and 6 in the SHARE.

The HRS conducts three breathing tests, while the SHARE only conducts two breathing tests. As such, **rWpuff3** is not available in the Gateway Harmonized SHARE as it is in the Harmonized HRS, and **rWpuff** is the maximum of two breathing tests in the Gateway Harmonized SHARE and is the maximum of three breathing tests in the Harmonized HRS.

How Constructed

rWpuffsft, **rWpuffref**, **rWpufftryu**, and **rWpuffothr** indicate the reasons for the respondent not taking part in the breathing test as reported by the interviewer. The interviewer is asked to report all of the reasons the respondent did not complete the breathing test. **rWpuffsft** indicates whether the respondent did not participate in the breathing test because the respondent or the interviewer felt it would not be safe. **rWpuffref** indicates whether the respondent did not participate in the breathing test because they refused, with no reason given. **rWpufftryu** indicates whether the respondent did not participate in the breathing test because they tried but were unable to complete the test. **rWpuffothr** indicates whether the respondent did not participate in the breathing test because they did not understand the instructions, or for another reason. **rWpuffsft**, **rWpuffref**, **rWpufftryu**, and **rWpuffothr** are coded as 0 if the specific reason was not given for the respondent not completing the breathing test, and are coded as 1 if the specific reason was given. Special missing (.c) is assigned if the respondent completed at least one of the breathing tests. Special missing (.p) is assigned if the interview was completed by proxy and the lung function tests were not completed. Don't know, refuse, and other missing responses to **rWpuffsft**, **rWpuffref**, **rWpufftryu**, and **rWpuffothr** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWpuffsft, **sWpuffref**, **sWpufftryu**, and **sWpuffothr** indicate the reasons for the respondent's current wave's spouse not taking part in the breathing test, and their values are taken from the spouse's values to **rWpuffsft**, **rWpuffref**, **rWpufftryu**, and **rWpuffothr**. In addition to the special missing codes employed by **rWpuffsft**, **rWpuffref**, **rWpufftryu**, and **rWpuffothr**, **sWpuffsft**, **sWpuffref**, **sWpufftryu**, and **sWpuffothr** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The breathing test is conducted in Waves 2, 4 and 6, and is not conducted in Waves 1, 3, 5, and starting in Wave 7.

In Wave 6, respondents whose interview was completed by proxy were not asked to take part in the breathing test. In Wave 6, the proxy assignment is based on a response indicating that it was a proxy interview when the respondent was asked if they were willing to participate in the breathing test.

Cross-Study Differences with the HRS

The HRS only asks respondents taking part in the enhanced face-to-face interview to take part in the breathing tests, while the SHARE does not have a similar restriction.

The breathing tests are available in every wave since Wave 7 of the HRS, while they are only available in Waves 2, 4, and 6 in the SHARE.

In addition to the respondent or interviewer feeling that it was unsafe to complete the breathing tests, **rWpuffsft** in the Harmonized HRS also incorporates the respondent's inability to participate due to health reasons. The Harmonized HRS also includes **rWpuffequp** which indicates whether there was a problem with the equipment or supplies.

Chair Stand Measurements: Single Chair Stand

Variable	Waves	Label	Type
rWchr1res	2, 5	rWchr1res:WW r result 1 chair stand	Categ
sWchr1res	2, 5	sWchr1res:WW s result 1 chair stand	Categ
rWchr1comp	2, 5	rWchr1comp:WW r willing and able to complete 1 chair stand	Categ
sWchr1comp	2, 5	sWchr1comp:WW s willing and able to complete 1 chair stand	Categ

How Constructed

rWchr1res indicates the result of the respondent's single chair stand. **rWchr1res** is coded as follows: 1.stood without using arms, 2.used arms to stand, 3.not completed. Special missing (.n) is assigned if the respondent did not feel it was safe to do the test. Special missing (.s) is assigned in Wave 2 if the respondent was 75 or more years of age and not asked to participate. Special missing (.p) is assigned if the respondent's interview was completed by proxy and the chair stand test was not completed. Don't know, refuse, and other missing responses to **rWchr1res** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWchr1res indicates the result of the respondent's current wave's spouse's single chair stand, and its values are taken from the spouse's values to **rWchr1res**. In addition to the special missing codes employed by **rWchr1res**, **sWchr1res** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWchr1comp indicates whether the respondent was willing and able to complete the single chair stand without using their arms. **rWchr1comp** is coded as 1 if the respondent was able to stand from the chair without using their arms. **rWchr1comp** is coded as 0 if the respondent was asked to take part in the single chair stand but felt it was unsafe, or was not able to complete the stand at all or without using their arms. Special missing (.s) is assigned in Wave 2 if the respondent was 75 or more years of age and not asked to participate. Special missing (.p) is assigned if the respondent's interview was completed by proxy and the chair stand test was not completed. Don't know, refuse, and other missing responses to **rWchr1comp** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWchr1comp indicates whether the respondent's current wave's spouse was willing and able to complete the single chair stand without using their arms, and its values are taken from the spouse's values to **rWchr1comp**. In addition to the special missing codes employed by **rWchr1comp**, **sWchr1comp** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The chair stand tests have been conducted in Waves 2 and 5, and have not been conducted in Waves 1, 3, 4, and starting in Wave 6.

In Wave 2, respondents aged 75 and older were not asked to participate in the chair stand tests. No age restriction is used in Wave 5.

Cross-Study Differences with the HRS

The HRS has not conducted chair stand tests. As such, these variables are not available in the Harmonized HRS.

sWchr5eff	2, 5	sWchr5eff:WW amount effort s gave 5 chair stands	Categ

How Constructed

rWchr5sec indicates the number of seconds it took the respondent to complete 5 consecutive chair stands. Special missing (.x) is assigned if the respondent was coded as failing to complete 5 chair stands in one minute. Special missing (.n) is assigned if the respondent did not feel it was safe to do the single chair stand or the 5 consecutive chair stands. Special missing (.s) is assigned in Wave 2 if the respondent was 75 or more years of age and not asked to participate. Special missing (.p) is assigned if the respondent's interview was completed by proxy and the chair stand test was not completed. Don't know, refuse, and other missing responses to **rWchr5sec** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWchr5sec indicates the number of seconds it took the respondent's current wave's spouse to complete 5 consecutive chair stands, and its values are taken from the spouse's values to **rWchr5sec**. In addition to the special missing codes employed by **rWchr5sec**, **sWchr5sec** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWchr5comp indicates whether the respondent was willing and able to complete 5 consecutive chair stands within one minute. **rWchr5comp** is coded as 1 if the respondent was able to complete 5 consecutive chair stands within one minute. **rWchr5comp** is coded as 0 if the respondent was asked to take part in chair stand test but felt it was unsafe, or was not able to complete the chair stands within one minute. Special missing (.s) is assigned in Wave 2 if the respondent was 75 or more years of age and not asked to participate. Special missing (.p) is assigned if the respondent's interview was completed by proxy and the chair stand test was not completed. Don't know, refuse, and other missing responses to **rWchr5comp** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWchr5comp indicates whether the respondent's current wave's spouse was willing and able to complete 5 consecutive chair stands within one minute, and its values are taken from the spouse's values to **rWchr5comp**. In addition to the special missing codes employed by **rWchr5comp**, **sWchr5comp** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWchr5eff indicates how much effort the interviewer reports the respondent using during the 5 chair stand test. **rWchr5eff** is coded as follows: 1.respondent gave full effort, 2.respondent was prevented from giving full effort by illness, pain, or other symptoms or discomforts, 3.respondent did not appear to give full effort, but no obvious reason for this. Special missing (.n) is assigned if the respondent did not feel it was safe to do the single chair stand or the 5 consecutive chair stands, or if the respondent tried but failed to do the single chair stand without using their arms. Special missing (.s) is assigned in Wave 2 if the respondent was 75 or more years of age and not asked to participate. Special missing (.p) is assigned if the respondent's interview was completed by proxy and the chair stand test was not completed. Don't know, refuse, and other missing responses to **rWchr5eff** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWchr5eff indicates how much effort the interviewer reports the respondent's current wave's spouse using during the 5 chair stand test, and its values are taken from the spouse's values to **rWchr5eff**. In addition to the special missing codes

employed by **rWchr5eff**, **sWchr5eff** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The chair stand tests have been conducted in Waves 2 and 5, and have not been conducted in Waves 1, 3, 4, and starting in Wave 6.

In Wave 2, respondents aged 75 and older were not asked to participate in the chair stand tests. No age restriction is used in Wave 5.

Cross-Study Differences with the HRS

The HRS has not conducted chair stand tests. As such, these variables are not available in the Harmonized HRS.

How Constructed

rWchrsft, **rWchrref**, **rWchrtryu**, and **rWchrothr** indicate the reasons for the respondent not taking part in the 1 or 5 chair stand tests as reported by the interviewer. The interviewer is asked to report all of the reasons the respondent did not complete the 1 or 5 chair stand tests. These variables incorporate the results from the single chair stand as well as those from the 5 chair stand test. These variables also incorporate whether the respondent felt it would be safe to participate in the single chair stand and the 5 chair stand and whether they attempted the single chair stand but failed to complete it without using their arms. **rWchrsft** indicates whether the respondent did not participate in the 1 or 5 chair stand tests because the respondent or the interviewer felt it would not be safe, including if the respondent thought it would be unsafe when initially asked to participate in either test. **rWchrref** indicates whether the respondent did not participate in the 1 or 5 chair stand tests because they refused, with no reason given. **rWchrtryu** indicates whether the respondent did not participate in the 1 or 5 chair stand tests because they tried but were unable to complete the test, including if they used their arms to stand during the test. **rWchrothr** indicates whether the respondent did not participate in the 1 or 5 chair stand tests because they did not understand the instructions, or for another reason. **rWchrsft**, **rWchrref**, **rWchrtryu**, and **rWchrothr** are coded as 0 if the specific reason was not given for the respondent not completing the single chair stand test or the 5 chair stand test, and are coded as 1 if the specific reason was given for not completing the single chair stand test or the 5 chair stand test. Special missing (.c) is assigned if the respondent completed the 1 and 5 chair stand tests in any reported amount of time. Special missing (.s) is assigned in Wave 2 if the respondent was 75 or more years of age and not asked to participate. Special missing (.p) is assigned if the respondent's interview was completed by proxy and the chair stand test was not completed. Don't know, refuse, and other missing responses to **rWchrsft**, **rWchrref**, **rWchrtryu**, and **rWch5othr** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

sWchrsft, **sWchrref**, **sWchrtryu**, and **sWchrothr** indicate the reasons for the respondent's current wave's spouse not taking part in the 1 or 5 chair stand tests, and their values are taken from the spouse's values to **rWchrsft**, **rWchrref**, **rWchrtryu**, and **rWchrothr**. In addition to the special missing codes employed by **rWchrsft**, **rWchrref**, **rWchrtryu**, and **rWchrothr**, **sWchrsft**, **sWchrref**, **sWchrtryu**, and **sWchrothr** employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The chair stand tests have been conducted in Waves 2 and 5, and have not been conducted in Waves 1, 3, 4, and starting in Wave 6.

In Wave 2, respondents aged 75 and older were not asked to participate in the chair stand tests. No age restriction is used in Wave 5.

Cross-Study Differences with the HRS

The HRS has not conducted chair stand tests. As such, these variables are not available in the Harmonized HRS.

How Constructed

In SHARE Waves 1, 2, 4, and 5, the family respondent was asked whether any family member from outside the household or any friend or neighbor gave them or their spouse any kind of help during the last twelve months from a list of types of help, including personal care, practical household help, and help with paperwork. If the respondent answered yes, they were then asked, for up to 3 people, who, from a list of relations, provided the help and how often the help was received by the respondent or the spouse from that person in the last twelve months, whether daily, weekly, monthly, or less. Respondents are instructed to start with the person who helped most often. In Waves 1 and 2, SHARE also asked how many hours the respondent or the spouse received help from that person altogether on a typical day, week, month, or in the last year, depending on the periodicity of the help indicated in the previous question. In SHARE Waves 1, 2, 4, and 5, after the family respondent was asked about help given from outside the household on behalf of themselves and their spouse, each respondent who did not live alone and who reported difficulty with at least one of 10 everyday activities previously asked about was asked whether anyone living in the household regularly helped them with personal care in the last twelve months. Regular care was defined as daily or almost daily care for at least three months. If the respondent answered yes, they were then asked who from a list of relations provided that help, and they could select as many relations as provided help.

Starting at Wave 6, all respondents are asked whether any family member from outside the household or any friend or neighbor gave them any kind of help during the last twelve months from a list of types of help, including personal care, practical household help, and help with paperwork. If the respondent answered yes, they were then asked, for up to 3 people, who, from a list of relations, provided the help and how often the help was received by the respondent from that person in the last twelve months, whether daily, weekly, monthly, or less. Respondents are instructed to start with the person who helped most often. After this, all respondents who did not live alone and reported difficulty with at least one of 10 everyday activities previously asked about or difficulty with at least one of 15 ADL and IADL activities also previously asked about are asked whether anyone living in the household regularly helped them with personal care in the last twelve months. Regular care was defined as daily or almost daily care for at least three months. If the respondent answered yes, they were then asked who from a list of relations provided that help, and they could select as many relations as provided help. In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care.

The list of 10 everyday activities which determined whether the respondent was asked about personal care provided from anyone inside the household included: 1. Walking 100 meters, 2. Sitting for about two hours, 3. Getting up from a chair after sitting for long periods, 4. Climbing several flights of stairs without resting, 5. Climbing one flight of stairs without resting, 6. Stooping, kneeling, or crouching, 7. Reaching or extending your arms above shoulder level, 8. Pulling or pushing large objects like a living room chair, 9. Lifting or carrying weights over 10 pounds/5 kilos, like a heavy bag of groceries, 10. Picking up a small coin from a table. The list of 15 ADL and IADL activities which also determined whether the respondent was asked about personal care provided from anyone inside the household starting at Wave 6 included: 1. Dressing, including putting on shoes and socks, 2. Walking across a room, 3. Bathing or showering, 4. Eating, such as cutting up your food, 5. Getting in or out of bed, 6. Using the toilet, including getting up or down, 7. Using a map to figure out how to get around in a strange place, 8. Preparing a hot meal, 9. Shopping for groceries, 10. Making telephone calls, 11. Taking medications, 12. Doing work around the house or garden, 13. Managing money, such as paying bills and keeping track of expenses, 14. Leaving the house independently and accessing transportation services, 15. Doing personal laundry.

The types of help used to define whether any help from outside the household was received include personal care, practical household help and help with paperwork. The examples given for personal care from outside the household include help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. The examples given for practical household help from outside the household include help with home repairs, gardening, transportation, shopping, and household chores. The examples given for help with paperwork from outside the household include help with filling out forms, and settling financial or legal matters. At Waves 4, 5, and 6, practical household help and help with paperwork were

listed together as a single type. In all other waves they were listed as separate types. The examples given to determine whether any personal care help was received from inside the household include help with washing, getting out of bed, or dressing.

The lists of relations used to determine who provided the help both from outside and inside the household include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5, these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, housekeepers/home health care providers, and relations not in this list.

hWrcaany indicates whether the respondent and/or spouse received any informal care from outside or inside the household in the last year. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. A code of 1 is used if the respondent and/or spouse received any type of help in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL. A code of 1 is used if the respondent and/or spouse received help from either outside or inside the household in the past year. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. At Waves 1, 2, 4, and 5, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrcaany indicates whether the respondent received any informal care from outside or inside the household in the last year and is available starting in Wave 6. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. A code of 1 is used if the respondent received any type of help in the past year. A code of 0 is used if the respondent received no help in the past year and the respondent reported difficulty with at least one ADL or IADL. If the respondent reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrcaany indicates whether the current wave's spouse received any informal care. It is taken from the spouse's **rWrcaany**. In addition to the special missing values used in **rWrcaany**, **sWrcaany** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrcasrc indicates whether the help received by the respondent and/or spouse came from outside or inside the household. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. This variable is provided because there are differences in how SHARE asks about help from outside the household versus help from inside the household. A code of 0 is used if the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL. A code of 1 is used if the respondent and/or spouse received help only from outside the household. A code of 2 is used if the respondent and/or spouse received help only from inside the household. A code of 3 is used if the respondent and/or spouse received help both from outside and inside the household. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the

respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. At Waves 1, 2, 4, and 5, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrCasrc indicates whether the help received by the respondent came from outside or inside the household and is available starting in Wave 6. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. This variable is provided because there are differences in how SHARE asks about help from outside the household versus help from inside the household. A code of 0 is used if the respondent received no help in the past year and the respondent reported difficulty with at least one ADL or IADL. A code of 1 is used if the respondent received help only from outside the household. A code of 2 is used if the respondent received help only from inside the household. A code of 3 is used if the respondent received help both from outside and inside the household. If the respondent reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrCasrc indicates whether help received by the current wave's spouse came from outside or inside the household. It is taken from the spouse's **rWrCasrc**. In addition to the special missing values used by **rWrCasrc**, **sWrCasrc** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrscare indicates whether the respondent and/or spouse received any informal care from a spouse/partner or ex-spouse/partner, either from outside or inside the household in the last year. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. A code of 1 is used if the respondent and/or spouse received any type of help from a spouse in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no help from a spouse in the past year, the respondent and/or spouse reported receiving some type of help, and the respondent and/or spouse reported difficulty with at least one ADL or IADL. If the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. At Waves 1, 2, 4, and 5, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrscare indicates whether the respondent received any informal care from a spouse/partner or ex-spouse/partner, either from outside or inside the household in the last year and is available starting in Wave 6. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household

only included help with personal care. A code of 1 is used if the respondent received any type of help from a spouse in the past year. A code of 0 is used if the respondent received no help from a spouse in the past year, the respondent reported receiving some type of help, and the respondent reported difficulty with at least one ADL or IADL. If the respondent received no help in the past year and the respondent reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrscare indicates whether the current wave's spouse received any informal care from a spouse. It is taken from the spouse's **rWrscare**. In addition to the special missing values used by **rWrscare**, **sWrscare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrscared_s indicates the greatest frequency at which the respondent and/or spouse received informal care from a spouse/partner or ex-spouse/partner in the past year. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent and spouse, if they have a spouse, received no help from a spouse in the past year, the respondent and/or spouse reported receiving some type of help, and the respondent and/or spouse reported difficulty with at least one ADL or IADL. A code of 1 indicates that the respondent and/or spouse received help from a spouse almost every day either because they said the help received from outside the household was daily or because they received regular help from inside the household. A code of 2 indicates that the respondent and/or spouse received help from a spouse almost every week. A code of 3 indicates that the respondent and/or spouse received help from a spouse almost every month. A code of 4 indicates that the respondent and/or spouse received help from a spouse less often than every month. If the respondent and/or spouse reported receiving help from multiple spouse/partners or ex-spouse/partners, **hWrscared_s** reflects the highest frequency reported among all spouses. **hWrscared_s** is also coded with a number of special missing values. If the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. At Waves 1, 2, 4, and 5, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrscared_s indicates the greatest frequency at which the respondent received informal care from a spouse/partner or ex-spouse/partner in the past year and is available starting in Wave 6. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent received no help from a spouse in the past year, the respondent reported receiving some type of help, and the respondent reported difficulty with at least one ADL or IADL. A code of 1 indicates that the respondent received help from a spouse almost every day either because they said the help received from outside the household was daily or because they received regular help from inside the household. A code of 2 indicates that the respondent received help from a spouse almost every week. A code of 3 indicates that the respondent received help from a spouse almost every month. A code of 4 indicates that the respondent received help from a spouse less often than every month. If the respondent reported receiving help from multiple spouse/partners or ex-spouse/partners, **rWrscared_s** reflects the highest frequency reported among all spouses. If the respondent received no

help in the past year and the respondent reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrscared_s indicates the current wave's spouse's greatest frequency of receiving informal care from a spouse. It is taken from the spouse's **rWrscared_s**. In addition to the special missing values used by **rWrscared_s**, **sWrscared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrscarehr captures the total hours per day the respondent and/or spouse received informal care from spouse/partners or ex-spouse/partners, from outside the household in the past year and is only available in Waves 1 and 2. SHARE asked how many hours the respondent and/or spouse received help from outside the household from each of the 3 possible helpers on a typical day, week, month, or in the last year, depending on the periodicity of the help previously indicated. SHARE did not ask about hours received informal care from inside the household. **hWrscarehr** is derived by adjusting the reported hours by the previously indicated periodicity so that all values are expressed in hours per day. This means: if the respondent and/or spouse received care from a spouse almost every week, then the hours reported are divided by 7; if the respondent and/or spouse received care from a spouse almost every month, then the hours reported are divided by 30; if the respondent and/or spouse received care from a spouse less often than every month, then the hours reported are divided by 365. If the respondent and/or spouse reported receiving help from multiple spouse/partners or ex-spouse/partners, **hWrscarehr** reflects the total hours reported for all spouses. If the respondent reported that any single spouse helped more than 24 hours a day, that report is not used in the calculation of **hWrscarehr**. Special missing (.i) is used if the only report of hours of care received from a spouse was considered invalid as it was greater than 24 hours a day. Special missing (.o) is assigned if the respondent and spouse, if they have a spouse, only received help from a spouse from inside the household, as the number of hours of help received from within the household is not asked. If the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWrccare indicates whether the respondent and/or spouse received any informal care from a child, child-in-law, or grandchild, either from outside or inside the household in the last year. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. A code of 1 is used if the respondent and/or spouse received any type of help from a child/grandchild in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no help from a child/grandchild in the past year, the respondent and/or spouse reported receiving some type of help, and the respondent and/or spouse reported difficulty with at least one ADL or IADL. If the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. At Waves 1, 2, 4, and 5, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with

both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrccare indicates whether the respondent received any informal care from a child, child-in-law, or grandchild, either from outside or inside the household in the last year and is available starting in Wave 6. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. A code of 1 is used if the respondent received any type of help from a child/grandchild in the past year. A code of 0 is used if the respondent received no help from a child/grandchild in the past year, the respondent reported receiving some type of help, and the respondent reported difficulty with at least one ADL or IADL. If the respondent received no help in the past year and the respondent reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrccare indicates whether the current wave's spouse received any informal care from a child/grandchild. It is taken from the spouse's **rWrccare**. In addition to the special missing values used by **sWrccare**, **sWrccare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrccared_s indicates the greatest frequency at which the respondent and/or spouse received informal care from a child, child-in-law, or grandchild in the past year. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent and spouse, if they have a spouse, received no help from a child/grandchild in the past year, the respondent and/or spouse reported receiving some type of help, and the respondent and/or spouse reported difficulty with at least one ADL or IADL. A code of 1 indicates that the respondent and/or spouse received help from a child/grandchild almost every day either because they said the help received from outside the household was daily or because they received regular help from inside the household. A code of 2 indicates that the respondent and/or spouse received help from a child/grandchild almost every week. A code of 3 indicates that the respondent and/or spouse received help from a child/grandchild almost every month. A code of 4 indicates that the respondent and/or spouse received help from a child/grandchild less often than every month. If the respondent and/or spouse reported receiving help from multiple children, children-in-law, or grandchildren, **hWrccared_s** reflects the highest frequency reported among all children/grandchildren. **hWrccared_s** is also coded with a number of special missing values. If the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. At Waves 1, 2, 4, and 5, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrccared_s indicates the greatest frequency at which the respondent received informal care from a child, child-in-law, or grandchild in the past year and is available starting in Wave 6. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was

provided daily or almost daily. A code of 0 indicates the respondent received no help from a child/grandchild in the past year, the respondent reported receiving some type of help, and the respondent reported difficulty with at least one ADL or IADL. A code of 1 indicates that the respondent received help from a child/grandchild almost every day either because they said the help received from outside the household was daily or because they received regular help from inside the household. A code of 2 indicates that the respondent received help from a child/grandchild almost every week. A code of 3 indicates that the respondent received help from a child/grandchild almost every month. A code of 4 indicates that the respondent received help from a child/grandchild less often than every month. If the respondent reported receiving help from multiple children, children-in-law, or grandchildren, **rWrccared_s** reflects the highest frequency reported among all children/grandchildren. If the respondent received no help in the past year and the respondent reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrccared_s indicates the current wave's spouse's greatest frequency of receiving informal care from a child/grandchild. It is taken from the spouse's **rWrccared_s**. In addition to the special missing values used in **rWrccared_s**, **sWrccared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrccarehr captures the total hours per day the respondent and/or spouse received informal care from children/grandchildren, from outside the household in the past year and is only available in Waves 1 and 2. SHARE asked how many hours the respondent and/or spouse received help from outside the household from each of the 3 possible helpers on a typical day, week, month, or in the last year, depending on the periodicity of the help previously indicated. SHARE did not ask about the hours they received informal care from inside the household. **hWrccarehr** is derived by adjusting the reported hours by the previously indicated periodicity so that all values are expressed in hours per day. This means: if the respondent and/or spouse received care from a child/grandchild almost every week, then the hours reported are divided by 7; if the respondent and/or spouse received care from a child/grandchild almost every month, then the hours reported are divided by 30; if the respondent and/or spouse received care from a child/grandchild less often than every month, then the hours reported are divided by 365. If the respondent and/or spouse reported receiving help from multiple children, children-in-law, or grandchildren, **hWrccarehr** reflects the total hours reported for all children/grandchildren. If the respondent reported that any single child/grandchild helped more than 24 hours a day, that report is not used in the calculation of **hWrccarehr**. Special missing (.i) is used if the only report of hours of care received from a child/grandchild was considered invalid as it was greater than 24 hours a day. Special missing (.o) is assigned if the respondent and spouse, if they have spouse, only received help from a child/grandchild from inside the household, as the number of hours of help received from within the household is not asked. If the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWrrcare indicates whether the respondent and/or spouse received any informal care from a parent, parent-in-law, step-parent, sibling, grandparent, or other relative, either from outside or inside the household in the last year. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. A code of 1 is used if the respondent and/or spouse received any type of help from a relative in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no help from a relative in the past year, the respondent and/or spouse reported receiving some type of help, and the respondent

and/or spouse reported difficulty with at least one ADL or IADL. If the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. At Waves 1, 2, 4, and 5, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrrcare indicates whether the respondent received any informal care from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative, either from outside or inside the household in the last year and is available starting in Wave 6. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. A code of 1 is used if the respondent received any type of help from a relative in the past year. A code of 0 is used if the respondent received no help from a relative in the past year, the respondent reported receiving some type of help, and the respondent reported difficulty with at least one ADL or IADL. If the respondent received no help in the past year and the respondent reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrrcare indicates whether the current wave's spouse received any informal care from a relative. It is taken from the spouse's **rWrrcare**. In addition to the special missing values used in **rWrrcare**, **sWrrcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrrcared_s indicates the greatest frequency at which the respondent and/or spouse received informal care from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative in the past year. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent and spouse, if they have a spouse, received no help from a relative in the past year, the respondent and/or spouse reported receiving some type of help, and the respondent and/or spouse reported difficulty with at least one ADL or IADL. A code of 1 indicates that the respondent and/or spouse received help from a relative almost every day either because they said the help received from outside the household was daily or because they received regular help from inside the household. A code of 2 indicates that the respondent and/or spouse received help from a relative almost every week. A code of 3 indicates that the respondent and/or spouse received help from a relative almost every month. A code of 4 indicates that the respondent and/or spouse received help from a relative less often than every month. If the respondent and/or spouse reported receiving help from multiple parents, parents-in-law, stepparents, siblings, grandparents, other relatives, **hWrrcared_s** reflects the highest frequency reported among all relatives. **hWrrcared_s** is also coded with a number of special missing values. If the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. At Waves 1, 2, 4, and 5, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday

activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrrcared_s indicates the greatest frequency at which the respondent received informal care from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative in the past year and is available starting in Wave 6. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent received no help from a relative in the past year, the respondent reported receiving some type of help, and the respondent reported difficulty with at least one ADL or IADL. A code of 1 indicates that the respondent received help from a relative almost every day either because they said the help received from outside the household was daily or because they received regular help from inside the household. A code of 2 indicates that the respondent received help from a relative almost every week. A code of 3 indicates that the respondent received help from a relative almost every month. A code of 4 indicates that the respondent received help from a relative less often than every month. If the respondent reported receiving help from multiple parents, parents-in-law, stepparents, siblings, grandparents, other relatives, **rWrrcared_s** reflects the highest frequency reported among all relatives. If the respondent received no help in the past year and the respondent reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrrcared_s indicates the current wave's spouse's greatest frequency of receiving informal care from a relative. It is taken from the spouse's **rWrrcared_s**. In addition to the special missing values used in **rWrrcared_s**, **sWrrcared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrrcarehr captures the total hours per day the respondent and/or spouse received informal care from relatives, from outside the household in the past year and is only available in Waves 1 and 2. SHARE asked how many hours the respondent and/or spouse received help from outside the household from each of the 3 possible helpers on a typical day, week, month, or in the last year, depending on the periodicity of the help previously indicated. SHARE did not ask about the hours they received informal care from inside the household. **hWrrcarehr** is derived by adjusting the reported hours by the previously indicated periodicity so that all values are expressed in hours per day. This means: if the respondent and/or spouse received care from a relative almost every week, then the hours reported are divided by 7; if the respondent and/or spouse received care from a relative almost every month, then the hours reported are divided by 30; if the respondent and/or spouse received care from a relative less often than every month, then the hours reported are divided by 365. If the respondent and/or spouse reported receiving help from multiple parents, parents-in-law, stepparents, siblings, grandparents, other relatives, **hWrrcarehr** reflects the total hours reported for all relatives. If the respondent reported that any single relative helped more than 24 hours a day, that report is not used in the calculation of **hWrrcarehr**. Special missing (.i) is used if the only report of hours of care received from a relative was considered invalid as it was greater than 24 hours a day. Special missing (.o) is assigned if the respondent and spouse, if they have spouse, only received help from a relative from inside the household, as the number of hours of help received from within the household is not asked. If the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively.

(.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWrfcare indicates whether the respondent and/or spouse received any informal care from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type, either from outside or inside the household in the last year. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. A code of 1 is used if the respondent and/or spouse received any type of help from a non-relative in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no help from a non-relative in the past year, the respondent and/or spouse reported receiving some type of help, and the respondent and/or spouse reported difficulty with at least one ADL or IADL. If the respondent and spouse, if they have a spouse, received no help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. At Waves 1, 2, 4, and 5, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrfcare indicates whether the respondent received any informal care from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type, either from outside or inside the household in the last year and is available starting in Wave 6. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. A code of 1 is used if the respondent received any type of help from a non-relative in the past year. A code of 0 is used if the respondent received no help from a non-relative in the past year, the respondent reported receiving some type of help, and the respondent reported difficulty with at least one ADL or IADL. If the respondent received no help in the past year and the respondent reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrfcare indicates whether the current wave's spouse received any informal care from a non-relative. It is taken from the spouse's **rWrfcare**. In addition to the special missing values used in **rWrfcare**, **sWrfcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrfcared_s indicates the greatest frequency at which the respondent and/or spouse received informal care from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type in the past year. The frequency of care received was only asked for care from outside the household. A code of 4 indicates that the respondent received help from a professional helper less often than every month. If the respondent reported receiving help from multiple therapists or other professional helpers, or housekeepers/home health care providers, **rWrpcared_s** reflects the highest frequency reported among all professional helpers. If the respondent received no help in the past year and the respondent reported difficulty with at least one ADL or IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

swrpcared_s is a flag variable indicating the current wave's spouse's greatest frequency of receiving informal care from a professional helper. It is taken from the spouse's **rWrpcared_s**. In addition to the special missing values used in **rWrpcared_s**, **swrpcared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Questions about informal care changed significantly over the waves of SHARE.

In SHARE Waves 1, 2, 4, and 5, the family respondent was asked whether any family member from outside the household or any friend or neighbor gave them or their spouse any kind of help. Starting at Wave 6, all respondents are asked whether any family member from outside the household or any friend or neighbor gave the respondent themselves any kind of help.

The types of help used to define whether any help from outside the household was received include personal care, practical household help and help with paperwork. At Waves 4, 5, and 6, practical household help and help with paperwork were listed together as a single type. In all other waves, they were listed as separate types.

The lists of relations used to determine who provided the help both from outside and inside the household include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5, these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, house-keepers/home health care providers, and relations not in this list. In Wave 4, respondents can also report which member of their social network provided this help, but the relation types for members of their social network are the same as the relation types used to ask about informal care received, so this change is not expected to have an effect on the harmonized variables of Wave 4. In Waves 6, 8, and 9, respondents are asked whether each relation who provided help was also a member of their social network, but respondents do not directly report that a social network member helped them as they did in Wave 4.

In SHARE Waves 1, 2, 4, and 5, respondents who reported difficulty with at least one of 10 everyday activities previously asked about were asked whether anyone living in the household regularly helped them with personal care. The list of 10 everyday activities included: 1. Walking 100 meters, 2. Sitting for about two hours, 3. Getting up from a chair after sitting for long periods, 4. Climbing several flights of stairs without resting, 5. Climbing one flight of stairs without resting, 6. Stooping, kneeling, or crouching, 7. Reaching or extending your arms above shoulder level, 8. Pulling or pushing large objects like a living room chair, 9. Lifting or carrying weights over 10 pounds/5 kilos, like a heavy bag of groceries, 10. Picking up a small coin from a table. Starting at Wave 6, respondents who reported difficulty with at least one of 10 everyday activities previously asked about or difficulty with at least one of 15 ADL and IADL activities also previously asked about are asked whether anyone living in the household regularly helped them with personal care. The list of 15 additional activities included: 1. Dressing, including putting on shoes and socks, 2. Walking across a room, 3. Bathing or showering, 4. Eating, such as cutting up your food, 5. Getting in or out of bed, 6. Using the toilet, including getting up or down, 7. Using a map to figure out how to get around in a strange place, 8. Preparing a hot meal, 9. Shopping for groceries, 10. Making telephone calls, 11. Taking medications, 12. Doing work around the house or garden, 13. Managing money, such as paying bills and keeping track of expenses, 14. Leaving the house independently and accessing transportation services, 15. Doing personal laundry.

In Waves 1 and 2, SHARE asked how many hours the respondent or the spouse received help from each helper. This was not asked in any following waves.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care.

Cross-Study Differences with the HRS

There are many differences between the questions about informal care received in HRS and SHARE.

Unlike SHARE, HRS did not make a distinction between care received from outside the household vs care received from inside the household. As HRS did not have this distinction, the comparable variables in the Harmonized HRS capture both ADL and IADL caregiving from both outside and inside the household, whereas the informal care received variables in the Gateway Harmonized SHARE do not capture IADL caregiving from inside the household as it was not asked about in SHARE.

Unlike SHARE, HRS asks each respondent about informal care received. Not until Wave 6 of SHARE did they start to ask each respondent individually about informal care received from outside the household. As a result, Gateway Harmonized SHARE informal caregiving variables at Waves 1, 2, 4, and 5 are household-level, whereas the comparable variables in the Harmonized HRS are respondent-level.

In SHARE, all couples or respondents are asked whether they received care from outside the household and only respondents who reported difficulty with at least one of 10 everyday activities (walking 100 meters, sitting for about two hours, getting up from a chair, climbing several flights of stairs, climbing one flight of stairs, stooping, kneeling, or crouching, reaching or extending your arms, pulling or pushing large objects, lifting or carrying weights over 10 pounds/5 kilos, or picking up a small coin) are asked whether they received care from inside the household. Additionally, starting at SHARE Wave 6, respondents could also report difficulty with one of 15 possible ADLs or IADLs (dressing, walking across a room, bathing, eating, getting in or out of bed, using the toilet, using a map, preparing a hot meal, Shopping for groceries, making telephone calls, taking medications, doing work around the house or garden, managing money, leaving the house independently and accessing transportation services, and doing personal laundry) to be asked whether they received care from inside the household. Differently in the HRS, respondents who report difficulty with at least one of 6 ADLs (dressing, walking across a room, bathing, eating, getting in and out of bed, and using the toilet) are asked about care received for those ADLs, respondents who report difficulty with at least one of 4 IADLs (preparing meals, grocery shopping, making phone calls, and taking medications) are asked about care received for those IADLs, and respondents who report difficulty with the IADL of managing money are asked about care received for managing money. This difference means that SHARE asks more respondents about care received from outside the household (asked even if they did not have difficulty) but fewer respondents about care received from inside the household (asked only if they had difficulty with the list of 10 everyday activities).

The HRS allows respondents to list up to 7 helpers for each of the 5 ADLs it asks about, up to 6 helpers for each of the 5 IADLs (besides managing money), and up to 2 helpers for managing money. Differently, SHARE allows respondents to list up to 3 helpers for help received outside of the household and asks respondents to identify as many relation types as necessary for help received from inside the household.

The HRS simply asks, "Who most often helps you with [the activities with which they report difficulty]?" The SHARE asks, "Has any family member from outside the household, any friend or neighbour given you any kind of help listed on this card?" and "Is there someone living in this household who has helped you regularly during the last twelve months with personal care?". Because of the difference in question wording, we believe both informal care and formal care are captured in the HRS, while only informal care is captured in the SHARE. As a result, the Harmonized HRS contains **rWrcany**, **rWrfaany**, **rWrpfcare**, and **rWrufcare** and related variables, while the Gateway Harmonized SHARE only includes variables for informal care and flag variables for care reported to be from professional sources despite being asked about informal sources of care. The care from professional sources is only considered a flag variable in the Gateway Harmonized SHARE because there could be additional sources of formal care that are not ascertained.

Because in the HRS, respondents are asked to list specific helpers and identify each by relation type, the Harmonized HRS can include counts of the number of helpers for children/grandchildren, relatives, and non-relatives. In SHARE for care received from inside the household, respondents are not asked to identify specific helpers but instead to identify the relation types which help so it is not possible count the number of helpers per relation type. For instance, it is not possible in SHARE to know if one or more than one grandchild helped the respondent with care.

Since Wave 2, HRS asked respondents how many days per month they received care from each helper and how many hours per day they received care from each helper. In SHARE, for care from outside the household, respondents were asked the frequency of help received using the scale of daily, weekly, monthly, or less for each helper. Only in Waves 1 and 2 of SHARE were respondents asked about hours of care for each helper and in those waves SHARE asked the number of hours given the frequency reported in the previous question.

In SHARE, respondents can report that they received care from a former spouse/partner. Not until Wave 6 of the HRS could HRS respondents report they received care from a former spouse/partner.

In the HRS, respondents can report that they received care from stepchildren since Wave 3. Starting in Wave 6 of the HRS, respondents can also report that they received care from former stepchildren, former children-in-law, and spouses of grandchildren. SHARE allows respondents to report help from a step-child/current partner's child in Wave 4 and starting again in Wave 6.

In the HRS, respondents can report that they receive care from siblings of their spouse since Wave 3. SHARE does not allow respondents to identify helpers as siblings of their spouse but does include grandparents, which is not included in the HRS.

Non-relatives in the Harmonized HRS informal caregiving variables include any other individuals and persons of unknown relations. Non-relatives in the Gateway Harmonized SHARE informal caregiving variables include friend, colleague, neighbor,

clergy, other acquaintance, or person of unlisted relation type.

How Constructed

In SHARE Waves 1 and 2, each respondent is asked whether they received any of the kinds of listed care in their home in the last twelve months, including professional or paid nursing or personal care, professional or paid home help for domestic tasks that they could not perform themselves due to health problems, and meals-on-wheels. If the respondent reported receiving professional or paid nursing or personal care, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving professional or paid home help, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving meals-on-wheels, then they are asked how many weeks they received meals-on-wheels in the last twelve months.

In SHARE Waves 1 and 2, each respondent is asked if they received any of the types of care from private providers that they paid themselves or through a private insurance because they would have waited too long or could not get them as much as they needed in the National Health System, and if so, whether they received home care or paid home help. Because there are no questions ascertaining the type of care the respondent received, these questions contribute only to help received for combined ADL and IADL variables, but do not contribute to help received for separate ADL and IADL variables.

Starting in SHARE Wave 5, each respondent is asked whether they received any professional or paid services of the kinds of listed care in their home in the last twelve months due to a physical, mental, emotional or memory problem, including help with personal care (e.g. getting in and out of bed, dressing, bathing and showering), help with domestic tasks (cleaning, ironing, cooking), meals-on-wheels (i.e. ready made meals provided by a municipality or a private provider), and help with other activities (e.g. filling a drug dispenser). Starting in Wave 7, if the respondent reported receiving professional or paid help with personal care, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving professional or paid help for domestic tasks, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving meals-on-wheels, then they are asked how many weeks they received meals-on-wheels in the last twelve months.

hWrfaany indicates whether the respondent and/or spouse received any formal care in their home in the last year. In Waves 1 and 2, this can include professional or paid nursing or personal care, professional or paid home help for domestic tasks, or meals-on-wheels, as well as home care or paid home help. Starting in Wave 5, this includes professional or paid services for help with personal care, domestic tasks, meals-on-wheels, or help with other activities. A code of 0 is used if the respondent and spouse, if they have a spouse, received no formal help in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL. A code of 1 is used if the respondent or spouse, if they have a spouse, did receive formal help in the past year, regardless of whether they reported difficulty with an ADL or IADL. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL and did not receive any formal

help, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse received formal care, special missing (.b) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **hWrfaany** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. These questions are not asked at all in Wave 4 and so **hWrfaany** is not available in Wave 4.

rWrfaany indicates whether the respondent received any formal care in their home in the last year. In Waves 1 and 2, this can include professional or paid nursing or personal care, professional or paid home help for domestic tasks, or meals-on-wheels, as well as home care or paid home help. Starting in Wave 5, this includes professional or paid services for help with personal care, domestic tasks, meals-on-wheels, or help with other activities. A code of 1 is used if the respondent received any type of formal help in the past year, regardless of whether they reported difficulty with an ADL or IADL. A code of 0 is used if the respondent received no formal help in the past year and the respondent reported difficulty with at least one ADL or IADL. If the respondent reported that they had no difficulty with any ADL or IADL and did not receive any formal help, special missing (.x) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **rWrfaany** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned in these cases. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. These questions are not asked at all in Wave 4 and so **rWrfaany** is not available in Wave 4.

sWrfaany indicates whether the current wave's spouse received any formal care. It is taken from the spouse's **rWrfaany**. In addition to the special missing values used in **rWrfaany**, **sWrfaany** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Please note that when asked about receiving informal care specifically, respondents are able to report that a therapist or other professional helper, or a housekeeper/home health care provider, either from outside or inside the household, provided help in the last year. Because these responses are based on questions asking specifically about informal care, these reports have not been incorporated into the variables listed here. Rather, these responses have been used to create **rWrpcare**. Please see "Section L: Receives Any Informal Care" for more information on this variable.

rWrfasrc indicates whether the formal help received by the respondent was received in the home or came from a private provider. Help received within the home includes professional or paid nursing or personal care, professional or paid home help for domestic tasks, or meals-on-wheels. Help received from private providers includes home care or paid home help. This variable is provided because there are differences in how SHARE asks about help received within the home versus help from private providers. A code of 0 is used if the respondent received no formal help in the past year and the respondent reported difficulty with at least one ADL or IADL. A code of 1 is used if the respondent received help only within their home. A code of 2 is used if the respondent received help only from private providers. A code of 3 is used if the respondent received help both within the home and from private providers. If the respondent reported that they had no difficulty with any ADL or IADL and did not receive any formal help, special missing (.x) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **rWrfasrc** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned in these cases. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. Because the questions asking about care from private providers are only available in Waves 1 and 2, **rWrfasrc** is only necessary and provided for these waves.

sWrfasrc indicates whether the formal help received by the current wave's spouse was received in the home or came from a private provider. It is taken from the spouse's **rWrfasrc**. In addition to the special missing values used by **rWrfasrc**, **sWrfasrc** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWrpufcarewpy indicates the total number of weeks per year the respondent received formal help in their home. In Waves 1 and 2, help received within the home includes professional or paid nursing or personal care, professional or paid home help for domestic tasks, or meals-on-wheels. For each type of formal help the respondent reported receiving in their home, the respondent is asked how many weeks they received that help in their home in the last year. The number of weeks per year of help is not asked if the respondent received care from private providers. Starting in Wave 7, the professional or paid services received in their home could be for help with personal care, help with domestic tasks, meals-on-wheels, or help with other activities. For help with personal care, domestic tasks, or meals-on-wheels, the respondent is asked how many weeks they received that help in their home in the last year. The number of weeks per year of help is not asked if the respondent received help with other activities. **rWrpufcarewpy** sums the number of weeks of formal help reported for each type of formal help received, and so values can be over 52. **rWrpufcarewpy** is assigned a value of 0 if the respondent did not receive any formal help and reported difficulty with at least one ADL or IADL. **rWrpufcarewpy** is assigned special missing (.p) in Waves 1 and 2 if the respondent only received formal help from private providers and so the number of weeks of help was not asked. It is assigned special missing (.w) starting in Wave 7 if the respondent only received help with other activities and so the number of weeks of help was not asked. If the respondent reported having difficulty with at least one ADL or IADL but receiving no help (formal or informal), then **rWrpufcarewpy** is assigned special missing (.h). At Wave 7, respondents who were given the condensed survey were not asked about informal caregiving so (.h) is not assigned for this part of the Wave 7 sample (identified by **inw7c**) and instead, these respondents who had a difficulty with an ADL or IADL but didn't receive formal care, are assigned a 0 value. If the respondent reported that they had no difficulty with any ADL or IADL and did not receive any formal help, special missing (.x) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **rWrpufcarewpy** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned in these cases. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. The number of weeks per year of help is only asked in Waves 1 and 2 and starting in Wave 7.

sWrpufcarewpy sums the number of weeks of formal help reported for each type of formal help received by the current wave's spouse. It is taken from the spouse's **rWrpufcarewpy**. In addition to the special missing values used by **rWrpufcarewpy**, **sWrpufcarewpy** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWrpufcarehpw indicates the total number of hours per week the respondent received formal help in their home. In Waves 1 and 2, help received within the home includes professional or paid nursing or personal care, professional or paid home help for domestic tasks, or meals-on-wheels. For professional or paid nursing or personal care and professional or paid home help for domestic tasks, the respondent is asked how many hours per week on average they received that help in their home in the last year. The number of hours per week of help is not asked if the respondent received meals-on-wheels or care from private providers. Starting in Wave 7, the professional or paid services received in their home could be for help with personal care, help with domestic tasks, meals-on-wheels, or help with other activities. For help with personal care and domestic tasks, the respondent is asked how many weeks they received that help in their home in the last year. The number of weeks per year of help is not asked if the respondent received meals-on-wheels or help with other activities.

rWrpufcarehpw sums the number of hours per week of formal help reported for each type of formal help received, and so values can be over 168. **rWrpufcarehpw** is assigned a value of 0 if the respondent did not receive any formal help and reported difficulty with at least one ADL or IADL. **rWrpufcarehpw** is assigned special missing (.p) in Waves 1 and 2 if the respondent only received formal help from meals-on-wheels or private providers and so the number of hours per week of help was not asked. It is assigned special missing (.w) starting in Wave 7 if the respondent only received meals-on-wheels or help with other activities and so the number of hours per week of help was not asked. If the respondent reported having

difficulty with at least one ADL or IADL but receiving no help (formal or informal), then **rWrpuFcarehpw** is assigned special missing (.h). At Wave 7, respondents who were given the condensed survey were not asked about informal caregiving so (.h) is not assigned for this part of the Wave 7 sample (identified by **inw7c**) and instead these respondents who had a difficulty with an ADL or IADL but didn't receive formal care are assigned a 0 value. If the respondent reported that they had no difficulty with any ADL or IADL and did not receive any formal help, special missing (.x) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **rWrpuFcarehpw** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned in these cases. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. The number of hours per week of help is only asked in Waves 1 and 2 and starting in Wave 7.

sWrpuFcarehpw sums the number of hours per week of formal help reported for each type of formal help received by the current wave's spouse. It is taken from the spouse's **rWrpuFcarehpw**. In addition to the special missing values used by **rWrpuFcarehpw**, **sWrpuFcarehpw** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Waves 1 and 2, respondents who do not live permanently in nursing homes are asked if they received any of the following types of care in their own home in the last twelve months: professional or paid nursing or personal care, professional or paid home help for domestic tasks that they could not perform themselves due to health problems, meals-on-wheels, or none of these. The number of weeks of help in the last year was asked for personal care, domestic tasks, and meals-on-wheels, while the number of hours per week on average of help in the last year was asked only for personal care and domestic tasks.

In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care from providers in their home. Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland.

In Waves 1 and 2, respondents are also shown a list and asked whether they received any of these types of care from private providers that they paid themselves or through private insurance because they would have waited too long or could not get them as much as they needed in the National Health System. The list includes options for home care and paid home help, among others. The respondent is not asked any further questions about the frequency of care received.

No questions about formal help received are asked in Wave 4.

Starting in Wave 5, all respondents are asked whether they received any professional or paid services of the kinds of listed care in their home in the last twelve months due to a physical, mental, emotional or memory problem. The list includes: help with personal care (e.g. getting in and out of bed, dressing, bathing and showering), help with domestic tasks (cleaning, ironing, cooking), meals-on-wheels (i.e. ready made meals provided by a municipality or a private provider), and help with other activities (e.g. filling a drug dispenser).

Starting in Wave 7, respondents who receive professional or paid services in their home for personal care, domestic tasks, or meals-on-wheels are asked the number of weeks per year they received help. Respondents who receive professional or paid services in their home for personal care or domestic tasks are asked the average number of hours per week they received help.

Also starting in Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care. Because it is not possible to capture informal caregiving patterns at Wave 7 for those respondent who received the condensed questionnaire, (.h) can not be not assigned in **r7rpufcarewpy** and **r7rpufcarehpw** for this part of the Wave 7 sample (identified by **inw7c**), instead these respondents who had a difficulty with an ADL or IADL but didn't receive formal care are assigned a 0 value.

Cross-Study Differences with the HRS

There are many differences between the questions about formal care received in HRS and SHARE.

While SHARE asks questions about formal care received regardless of difficulty with ADLs or IADLs, HRS only asks questions about care received if the respondent reported difficulty with at least one ADL or IADL. As a result, Gateway Harmonized SHARE variables are assigned special missing (.x) if they report no difficulty and receive no help, but are assigned a value of 1 if they report receiving help even if they report having no difficulty. Harmonized HRS variables are assigned a value of 1 if they report receiving help and having difficulty.

HRS asks for the relationship of each helper and whether that helper is paid, allowing for the creation of additional variables in the Harmonized HRS that cannot be constructed with the given information in the Gateway Harmonized SHARE. The Harmonized HRS and Gateway Harmonized SHARE both include **rWrfaany**, but the Harmonized HRS also includes variables describing the respondent's experience with paid and unpaid formal helpers.

The HRS allows respondents to list up to 7 helpers for each of the 5 ADLs it asks about, up to 6 helpers for each of the 5 IADLs (besides managing money), and up to 2 helpers for managing money. Differently, SHARE does not allow respondents to list the number of formal helpers, and only asks what type of activities they helped with.

The HRS asks about the frequency of care received in days per month and hours per day, while the SHARE asks about the frequency of formal care received in weeks per year and hours per week. As such, adjustment must be made before comparison of the help frequency variables.

Continuous Variable Distributions

Variable	N	Mean	Std.Dev	Minimum	Maximum	Total missing

Receives Any Care

Variable	Waves	Label	Type
hWrcany	1-2, 5-9	hWrcany:WW recv any care	Categ
rWrcany	6-9	rWrcany:WW r recv any care	Categ
sWrcany	6-9	sWrcany:WW s recv any care	Categ

How Constructed

hWrcany summarizes whether the respondent and/or spouse received any formal or informal care in the last year. In Waves 1 and 2, formal care can include professional or paid nursing or personal care, professional or paid home help for domestic tasks, or meals-on-wheels, as well as home care or paid home help received at home in the past year. Starting in Wave 5, formal care includes professional or paid services for help with personal care, domestic tasks, meals-on-wheels, or help with other activities received at home in the past year. In all waves, informal care includes care from outside or inside the household in the last year. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. **hWrcany** is assigned a code of 0 if the respondent and spouse, if they have a spouse, received no formal or informal care in the past year and the respondent and/or spouse reported difficulty with at least one ADL or IADL. **hWrcany** is assigned a code of 1 if the respondent and/or spouse received either formal or informal care in the past year. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care or other activities from inside or outside the household or from formal providers, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL or IADL, special missing (.s) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **hWrcany** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked questions about formal care in Greece and Switzerland, and so special missing (.e) is assigned. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked questions about formal care and are assigned special missing (.n). Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrcany summarizes whether the respondent received any formal or informal care in the last year and is available starting in Wave 6. Formal care includes professional or paid services for help with personal care, domestic tasks, meals-on-wheels, or help with other activities received at home in the past year. Informal care includes care from outside or inside the household in the last year. Help from outside the household could have been help with personal care, practical household help, or help with paperwork. Help from inside the household only included help with personal care. **rWrcany** is assigned a code of 0 if the respondent received no formal or informal care in the past year and the respondent reported difficulty with at least one ADL or IADL. **rWrcany** is assigned a code of 1 if the respondent received either formal or informal care in the past year. If the respondent reported that they had no difficulty with any ADL or IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrcany indicates whether the current wave's spouse received any formal or informal care. It is taken from the spouse's **rWrcany**. In addition to the special missing values used in **rWrcany**, **sWrcany** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrcany summarizes the information provided by **hWrcaany** and **hWrfaany**, while **rWrcany** summarizes the information provided by **rWrcaany** and **rWrfaany**. For more information on these comprising variables, please see the preceding pages of this section of the codebook "Receives Any Informal Care" and "Receives Any Formal Care".

Cross Wave Differences in SHARE

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care. Because it is not possible to capture informal caregiving patterns at Wave 7 for those respondent who received the condensed questionnaire, **h7rcany**, **r7rcany**, and **s7rcany** are only available for those respondents who completed the regular questionnaire.

Please also see the preceding sections for a detailed explanation of differences between waves.

Cross-Study Differences with the HRS

Questions on help received for difficulties with ADLs and IADLs are asked solely at the respondent level in the HRS, whereas questions on help received in the SHARE are asked at the couple level and respondent level and are not always dependent on reporting difficulty with ADLs and IADLs. As such, the Harmonized HRS includes only respondent level variables, whereas the Gateway Harmonized SHARE includes both couple and respondent level variables depending on how the information was collected over the waves. Variables in the Gateway Harmonized SHARE have been built to be as comparable as possible to variables of the same name in the Harmonized HRS, however, respondents who report receiving care in SHARE are assigned a value of 1 regardless of whether they report difficulty with an ADL or IADL, which would not occur in the Harmonized HRS variables.

Please see preceding sections for a detailed explanation of differences between the Harmonized HRS and Gateway Harmonized SHARE.

How Constructed

In SHARE Waves 1, 2, 4, and 5, the family respondent was asked whether any family member from outside the household or any friend or neighbor gave them or their spouse any kind of help during the last twelve months from a list of types of help, including personal care, practical household help, and help with paperwork. If the respondent answered yes, they were then asked, for up to 3 people, who, from a list of relations, provided the help and how often the help was received by the respondent or the spouse from that person in the last twelve months, whether daily, weekly, monthly, or less. Respondents are instructed to start with the person who helped most often. In Waves 1 and 2, SHARE also asked how many hours the respondent or the spouse received help from that person altogether on a typical day, week, month, or in the last year, depending on the periodicity of the help indicated in the previous question. Also in Waves 1 and 2, the family respondent was asked what type of help the person provided from a list of types of help. The respondent could select personal care, practical household help, and/or help with paperwork, and they could select as many types as the person provided. In SHARE Waves 1, 2, 4, and 5, after the family respondent was asked about help given from outside the household on behalf of themselves and their spouse, each respondent who did not live alone and who reported difficulty with at least one of 10 everyday activities previously asked about was asked whether anyone living in the household regularly helped them with personal care in the last twelve months. Regular care was defined as daily or almost daily care for at least three months. If the respondent answered yes, they were then asked who from a list of relations provided that help, and they could select as many relations as provided help.

Starting at Wave 6, all respondents are asked whether any family member from outside the household or any friend or neighbor gave them any kind of help during the last twelve months from a list of types of help, including personal care, practical household help, and help with paperwork. If the respondent answered yes, they were then asked, for up to 3 people, who, from a list of relations, provided the help and how often the help was received by the respondent from that person in the last twelve months, whether daily, weekly, monthly, or less. Respondents are instructed to start with the person who helped most often. The respondent is then asked what type of help the person provided from a list of types of help. The respondent could select personal care, practical household help, and/or help with paperwork, and they could select as many types as the person provided. After this, all respondents who did not live alone and reported difficulty with at least one of 10 everyday activities previously asked about or difficulty with at least one of 15 ADL and IADL activities also previously asked about are asked whether anyone living in the household regularly helped them with personal care in the last twelve months. Regular care was defined as daily or almost daily care for at least three months. If the respondent answered yes, they were then asked who from a list of relations provided that help, and they could select as many relations as provided help. In Wave 7,

only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care.

The list of 10 everyday activities which determined whether the respondent was asked about personal care provided from anyone inside the household included: 1. Walking 100 meters, 2. Sitting for about two hours, 3. Getting up from a chair after sitting for long periods, 4. Climbing several flights of stairs without resting, 5. Climbing one flight of stairs without resting, 6. Stooping, kneeling, or crouching, 7. Reaching or extending your arms above shoulder level, 8. Pulling or pushing large objects like a living room chair, 9. Lifting or carrying weights over 10 pounds/5 kilos, like a heavy bag of groceries, 10. Picking up a small coin from a table. The list of 15 ADL and IADL activities which also determined whether the respondent was asked about personal care provided from anyone inside the household starting at Wave 6 included: 1. Dressing, including putting on shoes and socks, 2. Walking across a room, 3. Bathing or showering, 4. Eating, such as cutting up your food, 5. Getting in or out of bed, 6. Using the toilet, including getting up or down, 7. Using a map to figure out how to get around in a strange place, 8. Preparing a hot meal, 9. Shopping for groceries, 10. Making telephone calls, 11. Taking medications, 12. Doing work around the house or garden, 13. Managing money, such as paying bills and keeping track of expenses, 14. Leaving the house independently and accessing transportation services, 15. Doing personal laundry.

The types of help used to define whether any help from outside the household was received include personal care, practical household help and help with paperwork. The examples given for personal care from outside the household include help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. The examples given for practical household help from outside the household include help with home repairs, gardening, transportation, shopping, and household chores. The examples given for help with paperwork from outside the household include help with filling out forms, and settling financial or legal matters. At Waves 4, 5, and 6, practical household help and help with paperwork were listed together as a single type. In all other waves they were listed as separate types. The examples given to determine whether any personal care help was received from inside the household include help with washing, getting out of bed, or dressing.

The lists of relations used to determine who provided the help both from outside and inside the household include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5, these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, housekeepers/home health care providers, and relations not in this list.

hWracaany indicates whether the respondent and/or spouse received any informal care for activities of daily living (ADLs) from outside or inside the household in the last year. **hWracaany** is available at Waves 1 and 2 and then at Wave 6 and all following waves. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent and/or spouse received any ADL help in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. At Waves 1 and 2, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWracaany indicates whether the respondent received any informal care for activities of daily living (ADLs) from outside or inside the household in the last year and is available starting in Wave 6. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent received any ADL help in the past year. A code of 0 is used if the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL. If the respondent reported that they had

no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWracaany indicates whether the current wave's spouse received any informal care for activities of daily living (ADLs). It is taken from the spouse's **rWracaany**. In addition to the special missing values used in **rWracaany**, **sWracaany** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWracasrc indicates whether the help with activities of daily living (ADLs) received by the respondent and/or spouse came from outside or inside the household. **hWracasrc** is available at Wave 1 and 2 and then at Wave 6 and all following waves. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. This variable is provided because there are differences in how SHARE asks about help from outside the household versus help from inside the household. A code of 0 is used if the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL. A code of 1 is used if the respondent and/or spouse received ADL help only from outside the household. A code of 2 is used if the respondent and/or spouse received ADL help only from inside the household. A code of 3 is used if the respondent and/or spouse received ADL help both from outside and inside the household. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. At Waves 1 and 2, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWracasrc indicates whether the help with activities of daily living (ADLs) received by the respondent came from outside or inside the household and is available starting in Wave 6. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. This variable is provided because there are differences in how SHARE asks about help from outside the household versus help from inside the household. A code of 0 is used if the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL. A code of 1 is used if the respondent received ADL help only from outside the household. A code of 2 is used if the respondent received ADL help only from inside the household. A code of 3 is used if the respondent received ADL help both from outside and inside the household. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWracasrc indicates whether the help with activities of daily living (ADLs) received by current wave's spouse came from outside or inside the household. It is taken from the spouse's **rWracasrc**. In addition to the special missing values used in **rWracasrc**, **sWracasrc** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrascare indicates whether the respondent and/or spouse received any informal care for activities of daily living (ADLs) from a spouse/partner or ex-spouse/partner, either from outside or inside the household in the last year. **hWrascare** is available at Waves 1 and 2 and then at Wave 6 and all following waves. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent and/or spouse received any ADL help from a spouse in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no ADL help from a spouse in the past year, the respondent and/or spouse reported receiving some ADL help, and the respondent and/or spouse reported difficulty with at least one ADL. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. At Waves 1 and 2, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they did had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrascare indicates whether the respondent received any informal care for activities of daily living (ADLs) from a spouse/partner or ex-spouse/partner, either from outside or inside the household in the last year and is available starting in Wave 6. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent received any ADL help from a spouse in the past year. A code of 0 is used if the respondent received no ADL help from a spouse in the past year, the respondent reported receiving some ADL help, and the respondent reported difficulty with at least one ADL. If the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrascare indicates whether the current wave's spouse received any informal care for activities of daily living (ADLs) from a spouse. It is taken from the spouse's **rWrascare**. In addition to the special missing values used by **rWrascare**, **sWrascare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrascared_s indicates the greatest frequency at which the respondent and/or spouse received informal care for activities of daily living (ADLs) from a spouse/partner or ex-spouse/partner in the past year. **hWrascared_s** is available at Waves 1 and 2 and then at Wave 6 and all following waves. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent and spouse, if they have a spouse, received no ADL help from a spouse in the past year, the respondent and/or spouse reported receiving some ADL help, and the respondent and/or spouse reported difficulty with at least one ADL. A code of 1 indicates that the respondent and/or spouse received ADL help from a spouse almost every day either because they said the ADL help received from outside the household was daily or because they received regular ADL help from inside the household. A code of 2 indicates that the respondent and/or spouse received ADL help from a spouse almost every week. A code of 3 indicates that the respondent and/or spouse received ADL help from a spouse almost every month. A code of 4 indicates that the respondent and/or spouse received ADL help from a spouse less often than every month. If the respondent and/or spouse reported receiving ADL help from multiple spouse/partners

or ex-spouse/partners, **hWrascared_s** reflects the highest frequency reported among all spouses. **hWrascared_s** is also coded with a number of special missing values. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. At Waves 1 and 2, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrascared_s indicates the greatest frequency at which the respondent received informal care for activities of daily living (ADLs) from a spouse/partner or ex-spouse/partner in the past year and is available starting in Wave 6. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent received no ADL help from a spouse in the past year, the respondent reported receiving some ADL help, and the respondent reported difficulty with at least one ADL. A code of 1 indicates that the respondent received ADL help from a spouse almost every day either because they said the ADL help received from outside the household was daily or because they received regular ADL help from inside the household. A code of 2 indicates that the respondent received ADL help from a spouse almost every week. A code of 3 indicates that the respondent received ADL help from a spouse almost every month. A code of 4 indicates that the respondent received ADL help from a spouse less often than every month. If the respondent reported receiving ADL help from multiple spouse/partners or ex-spouse/partners, **rWrascared_s** reflects the highest frequency reported among all spouses. If the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrascared_s indicates the current wave's spouse's greatest frequency of receiving informal care for activities of daily living (ADLs) from a spouse. It is taken from the spouse's **rWrascared_s**. In addition to the special missing values used in **rWrascared_s**, **sWrascared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrascarehr captures the total hours per day the respondent and/or spouse received informal care for activities of daily living (ADLs) from spouse/partners or ex-spouse/partners, from outside the household in the past year and is only available in Waves 1 and 2. SHARE asked how many hours the respondent and/or spouse received ADL help from outside the household from each of the 3 possible helpers on a typical day, week, month, or in the last year, depending on the periodicity of the help previously indicated. SHARE did not ask about the hours they received informal care for ADLs from inside the household. **hWrascarehr** is derived by adjusting the reported hours by the previously indicated periodicity so that all values are expressed in hours per day. This means: if the respondent and/or spouse received care from a spouse almost every week, then the hours reported are divided by 7; if the respondent and/or spouse received care from a spouse almost every month, then the hours reported are divided by 30; if the respondent and/or spouse received care from a spouse less often than every month, then the hours reported are divided by 365. If the respondent and/or spouse reported receiving ADL help from multiple spouse/partners or ex-spouse/partners, **hWrascarehr** reflects the total hours reported for all spouses. If the respondent reported that any single spouse helped with ADLs more than 24 hours a day, that report is not used in the calculation of **hWrascarehr**. Special missing (.i) is used if the only report of hours of ADL care received from a spouse was considered invalid as it was greater than 24 hours a day. Special missing (.o) is assigned if the respondent and spouse, if they have spouse, only received ADL help from a spouse from inside the household, as the number of hours of help received

from within the household is not asked. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWraccare indicates whether the respondent and/or spouse received any informal care for activities of daily living (ADLs) from a child, child-in-law, or grandchild, either from outside or inside the household in the last year. **hWraccare** is available at Wave 1 and 2 and then at Wave 6 and all following waves. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent and/or spouse received any ADL help from a child/grandchild in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no ADL help from a child/grandchild in the past year, the respondent and/or spouse reported receiving some ADL help, and the respondent and/or spouse reported difficulty with at least one ADL. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. At Waves 1 and 2, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWraccare indicates whether the respondent received any informal care for activities of daily living (ADLs) from a child, child-in-law, or grandchild, either from outside or inside the household in the last year and is available starting in Wave 6. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent received any ADL help from a child/grandchild in the past year. A code of 0 is used if the respondent received no ADL help from a child/grandchild in the past year, the respondent reported receiving some ADL help, and the respondent reported difficulty with at least one ADL. If the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWraccare indicates whether the current wave's spouse received any informal care for activities of daily living (ADLs) from a child/grandchild. It is taken from the spouse's **rWraccare**. In addition to the special missing values used in **rWraccare**, **sWraccare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWraccared_s indicates the greatest frequency at which the respondent and/or spouse received informal care for activities

of daily living (ADLs) from a child, child-in-law, or grandchild in the past year. **hWraccared_s** is available at Waves 1 and 2 and then at Wave 6 and all following waves. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent and spouse, if they have a spouse, received no ADL help from a child/grandchild in the past year, the respondent and/or spouse reported receiving some ADL help, and the respondent and/or spouse reported difficulty with at least one ADL. A code of 1 indicates that the respondent and/or spouse received ADL help from a child/grandchild almost every day either because they said the ADL help received from outside the household was daily or because they received regular ADL help from inside the household. A code of 2 indicates that the respondent and/or spouse received ADL help from a child/grandchild almost every week. A code of 3 indicates that the respondent and/or spouse received ADL help from a child/grandchild almost every month. A code of 4 indicates that the respondent and/or spouse received ADL help from a child/grandchild less often than every month. If the respondent and/or spouse reported receiving ADL help from multiple children, children-in-law, or grandchildren, **hWraccared_s** reflects the highest frequency reported among all children/grandchildren. **hWraccared_s** is also coded with a number of special missing values. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. At Waves 1 and 2, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWraccared_s indicates the greatest frequency at which the respondent received informal care for activities of daily living (ADLs) from a child, child-in-law, or grandchild in the past year and is available starting in Wave 6. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent received no ADL help from a child/grandchild in the past year, the respondent reported receiving some ADL help, and the respondent reported difficulty with at least one ADL. A code of 1 indicates that the respondent received ADL help from a child/grandchild almost every day either because they said the ADL help received from outside the household was daily or because they received regular ADL help from inside the household. A code of 2 indicates that the respondent received ADL help from a child/grandchild almost every week. A code of 3 indicates that the respondent received ADL help from a child/grandchild almost every month. A code of 4 indicates that the respondent received ADL help from a child/grandchild less often than every month. If the respondent reported receiving ADL help from multiple children, children-in-law, or grandchildren, **rWraccared_s** reflects the highest frequency reported among all children/grandchildren. If the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWraccared_s indicates the current wave's spouse's greatest frequency of receiving informal care for activities of daily living (ADLs) from a child/grandchild. It is taken from the spouse's **rWraccared_s**. In addition to the special missing values used in **rWraccared_s**, **sWraccared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWraccarehr captures the total hours per day the respondent and/or spouse received informal care for activities of daily living (ADLs) from children/grandchildren, from outside the household in the past year and is only available in Waves 1 and 2. SHARE asked how many hours the respondent and/or spouse received ADL help from outside the household from each of the

3 possible helpers on a typical day, week, month, or in the last year, depending on the periodicity of the help previously indicated. SHARE did not ask about the hours they received informal care for ADLs from inside the household. **hWraccarehr** is derived by adjusting the reported hours by the previously indicated periodicity so that all values are expressed in hours per day. This means: if the respondent and/or spouse received care from a child/grandchild almost every week, then the hours reported are divided by 7; if the respondent and/or spouse received care from a child/grandchild almost every month, then the hours reported are divided by 30; if the respondent and/or spouse received care from a child/grandchild less often than every month, then the hours reported are divided by 365. If the respondent and/or spouse reported receiving ADL help from multiple children, children-in-law, or grandchildren, **hWraccarehr** reflects the total hours reported for all children/grandchildren. If the respondent reported that any single child/grandchild helped with ADLs more than 24 hours a day, that report is not used in the calculation of **hWraccarehr**. Special missing (.i) is used if the only report of hours of ADL care received from a child/grandchild was considered invalid as it was greater than 24 hours a day. Special missing (.o) is assigned if the respondent and spouse, if they have spouse, only received ADL help from a child/grandchild from inside the household, as the number of hours of help received from within the household is not asked. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWrarcare indicates whether the respondent and/or spouse received any informal care for activities of daily living (ADLs) from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative, either from outside or inside the household in the last year. **hWrarcare** is available at Waves 1 and 2 and then at Wave 6 and all following waves. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent and/or spouse received any ADL help from a relative in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no ADL help from a relative in the past year, the respondent and/or spouse reported receiving some ADL help, and the respondent and/or spouse reported difficulty with at least one ADL. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. At Waves 1 and 2, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrarcare indicates whether the respondent received any informal care for activities of daily living (ADLs) from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative, either from outside or inside the household in the last year and is available starting in Wave 6. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent received any ADL help from a relative in the past year. A code of 0 is used if the respondent received no ADL help from a relative in the past year, the respondent reported receiving some ADL help, and the respondent reported difficulty with at least one ADL. If the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty

with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrarcare indicates whether the current wave's spouse received any informal care for activities of daily living (ADLs) from a relative. It is taken from the spouse's **rWrarcare**. In addition to the special missing values used in **rWrarcare**, **sWrarcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrarcared_s indicates the greatest frequency at which the respondent and/or spouse received informal care for activities of daily living (ADLs) from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative in the past year. **hWrarcared_s** is available at Waves 1 and 2 and then at Wave 6 and all following waves. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent and spouse, if they have a spouse, received no ADL help from a relative in the past year, the respondent and/or spouse reported receiving some ADL help, and the respondent and/or spouse reported difficulty with at least one ADL. A code of 1 indicates that the respondent and/or spouse received ADL help from a relative almost every day either because they said the ADL help received from outside the household was daily or because they received regular ADL help from inside the household. A code of 2 indicates that the respondent and/or spouse received ADL help from a relative almost every week. A code of 3 indicates that the respondent and/or spouse received ADL help from a relative almost every month. A code of 4 indicates that the respondent and/or spouse received ADL help from a relative less often than every month. If the respondent and/or spouse reported receiving ADL help from multiple parents, parents-in-law, stepparents, siblings, grandparents, other relatives, **hWrarcared_s** reflects the highest frequency reported among all relatives. **hWrarcared_s** is also coded with a number of special missing values. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. At Waves 1 and 2, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrarcared_s indicates the greatest frequency at which the respondent received informal care for activities of daily living (ADLs) from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative in the past year and is available starting in Wave 6. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent received no ADL help from a relative in the past year, the respondent reported receiving some ADL help, and the respondent reported difficulty with at least one ADL. A code of 1 indicates that the respondent received ADL help from a relative almost every day either because they said the ADL help received from outside the household was daily or because they received regular ADL help from inside the household. A code of 2 indicates that the respondent received ADL help from a relative almost every week. A code of 3 indicates that the respondent received ADL help from a relative almost every month. A code of 4 indicates that the respondent received ADL help from a relative less often than every month. If the respondent reported receiving ADL help from multiple parents, parents-in-law, stepparents, siblings, grandparents, other relatives, **rWrarcared_s** reflects the highest frequency reported among all relatives. If the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not

asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrarcared_s indicates the current wave's spouse's greatest frequency of receiving informal care for activities of daily living (ADLs) from a relative. It is taken from the spouse's **rWrarcared_s**. In addition to the special missing values used in **rWrarcared_s**, **sWrarcared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrarcarehr captures the total hours per day the respondent and/or spouse received informal care for activities of daily living (ADLs) from relatives, from outside the household in the past year and is only available in Waves 1 and 2. SHARE asked how many hours the respondent and/or spouse received ADL help from outside the household from each of the 3 possible helpers on a typical day, week, month, or in the last year, depending on the periodicity of the help previously indicated. SHARE did not ask about the hours they received informal care for ADLs from inside the household. **hWrarcarehr** is derived by adjusting the reported hours by the previously indicated periodicity so that all values are expressed in hours per day. This means: if the respondent and/or spouse received care from a relative almost every week, then the hours reported are divided by 7; if the respondent and/or spouse received care from a relative almost every month, then the hours reported are divided by 30; if the respondent and/or spouse received care from a relative less often than every month, then the hours reported are divided by 365. If the respondent and/or spouse reported receiving ADL help from multiple parents, parents-in-law, stepparents, siblings, grandparents, other relatives, **hWrarcarehr** reflects the total hours reported for all relatives. If the respondent reported that any single relative helped with ADLs more than 24 hours a day, that report is not used in the calculation of **hWrarcarehr**. Special missing (.i) is used if the only report of hours of ADL care received from a relative was considered invalid as it was greater than 24 hours a day. Special missing (.o) is assigned if the respondent and spouse, if they have spouse, only received ADL help from a relative from inside the household, as the number of hours of help received from within the household is not asked. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWrafcare indicates whether the respondent and/or spouse received any informal care for activities of daily living (ADLs) from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type, either from outside or inside the household in the last year. **hWrafcare** is available at Waves 1 and 2 and then at Wave 6 and all following waves. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent and/or spouse received any ADL help from a non-relative in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no ADL help from a non-relative in the past year, the respondent and/or spouse reported receiving some ADL help, and the respondent and/or spouse reported difficulty with at least one ADL. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. At Waves 1 and 2, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special

missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrafcare indicates whether the respondent received any informal care for activities of daily living (ADLs) from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type, either from outside or inside the household in the last year and is available starting in Wave 6. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent received any ADL help from a non-relative in the past year. A code of 0 is used if the respondent received no ADL help from a non-relative in the past year, the respondent reported receiving some ADL help, and the respondent reported difficulty with at least one ADL. If the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

swrafcare indicates whether the current wave's spouse received any informal care for activities of daily living (ADLs) from a non-relative. It is taken from the spouse's **rWrafcare**. In addition to the special missing values used in **rWrafcare**, **swrafcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrafcared_s indicates the greatest frequency at which the respondent and/or spouse received informal care for activities of daily living (ADLs) from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type in the past year. **hWrafcared_s** is available at Waves 1 and 2 and then at Wave 6 and all following waves. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent and spouse, if they have a spouse, received no ADL help from a non-relative in the past year, the respondent and/or spouse reported receiving some ADL help, and the respondent and/or spouse reported difficulty with at least one ADL. A code of 1 indicates that the respondent and/or spouse received ADL help from a non-relative almost every day either because they said the ADL help received from outside the household was daily or because they received regular ADL help from inside the household. A code of 2 indicates that the respondent and/or spouse received ADL help from a non-relative almost every week. A code of 3 indicates that the respondent and/or spouse received ADL help from a non-relative almost every month. A code of 4 indicates that the respondent and/or spouse received ADL help from a non-relative less often than every month. If the respondent and/or spouse reported receiving ADL help from multiple friends, colleagues, neighbors, clergy, other acquaintances, or persons of unlisted relation type, **hWrafcared_s** reflects the highest frequency reported among all non-relatives. **hWrafcared_s** is also coded with a number of special missing values. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. At Waves 1 and 2, respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrafcared_s indicates the greatest frequency at which the respondent received informal care for activities of daily living (ADLs) from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type in the past year,

and is available starting in Wave 6. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent received no ADL help from a non-relative in the past year, the respondent reported receiving some ADL help, and the respondent reported difficulty with at least one ADL. A code of 1 indicates that the respondent received ADL help from a non-relative almost every day either because they said the ADL help received from outside the household was daily or because they received regular ADL help from inside the household. A code of 2 indicates that the respondent received ADL help from a non-relative almost every week. A code of 3 indicates that the respondent received ADL help from a non-relative almost every month. A code of 4 indicates that the respondent received ADL help from a non-relative less often than every month. If the respondent reported receiving ADL help from multiple friends, colleagues, neighbors, clergy, other acquaintances, or persons of unlisted relation type, **rWrafcares** reflects the highest frequency reported among all non-relatives. If the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrafcares indicates the current wave's spouse's greatest frequency of receiving informal care for activities of daily living (ADLs) from a non-relative. It is taken from the spouse's **rWrafcares**. In addition to the special missing values used in **rWrafcares**, **sWrafcares** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrafcarehr captures the total hours per day the respondent and/or spouse received informal care for activities of daily living (ADLs) from non-relatives, from outside the household in the past year and is only available in Waves 1 and 2. SHARE asked how many hours the respondent and/or spouse received ADL help from outside the household from each of the 3 possible helpers on a typical day, week, month, or in the last year, depending on the periodicity of the help previously indicated. SHARE did not ask about the hours they received informal care for ADLs from inside the household. **hWrafcarehr** is derived by adjusting the reported hours by the previously indicated periodicity so that all values are expressed in hours per day. This means: if the respondent and/or spouse received care from a non-relative almost every week, then the hours reported are divided by 7; if the respondent and/or spouse received care from a non-relative almost every month, then the hours reported are divided by 30; if the respondent and/or spouse received care from a non-relative less often than every month, then the hours reported are divided by 365. If the respondent and/or spouse reported receiving ADL help from multiple friends, colleagues, neighbors, clergy, other acquaintances, or persons of unlisted relation type, **hWrafcarehr** reflects the total hours reported for all non-relatives. **hWrafcarehr** is also coded with a number of special missing values. If the respondent reported that any single non-relative helped with ADLs more than 24 hours a day, that report is not used in the calculation of **hWrafcarehr**. Special missing (.i) is used if the only report of hours of ADL care received from a non-relative was considered invalid as it was greater than 24 hours a day. Special missing (.o) is assigned if the respondent and spouse, if they have spouse, only received ADL help from a non-relative from inside the household, as the number of hours of help received from within the household is not asked. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with the 10 everyday activities previously asked about. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWrapcare is a flag variable indicating whether the respondent and/or spouse reported receiving any informal care for activities of daily living (ADLs) from a therapist or other professional helper, or housekeeper/home health care provider, either from outside or inside the household in the last year. **hWrapcare** is available starting Wave 6. ADL help from outside

the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent and/or spouse received any ADL help from a professional helper in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no ADL help from a professional helper in the past year, the respondent and/or spouse reported receiving some ADL help, and the respondent and/or spouse reported difficulty with at least one ADL. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrapcare is a flag variable indicating whether the respondent reported receiving any informal care for activities of daily living (ADLs) from a therapist or other professional helper, or housekeeper/home health care provider, either from outside or inside the household in the last year and is available starting in Wave 6. ADL help from outside the household was asked using the examples of help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. A code of 1 is used if the respondent received any ADL help from a professional helper in the past year. A code of 0 is used if the respondent received no ADL help from a professional helper in the past year, the respondent reported receiving some ADL help, and the respondent reported difficulty with at least one ADL. If the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrapcare is a flag variable indicating whether the current wave's spouse reported receiving any informal care for activities of daily living (ADLs) from a professional helper. It is taken from the spouse's **rWrapcare**. In addition to the special missing values used in **rWrapcare**, **sWrapcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrapcared_s is a flag variable indicating the greatest frequency at which the respondent and/or spouse reported receiving informal care for activities of daily living (ADLs) from a therapist or other professional helper, or housekeeper/home health care provider in the past year. **hWrapcared_s** is available starting at Wave 6. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent and spouse, if they have a spouse, received no ADL help from a professional helper in the past year, the respondent and/or spouse reported receiving some ADL help, and the respondent and/or spouse reported difficulty with at least one ADL. A code of 1 indicates that the respondent and/or spouse received ADL help from a professional helper almost every day either because they said the ADL help received from outside the household was daily or because they received regular ADL help from inside the household. A code of 2 indicates that the respondent and/or spouse received ADL help from a professional helper almost every week. A code of 3 indicates that the respondent and/or spouse received ADL help from a professional helper almost every month. A code of 4 indicates that the respondent and/or spouse received ADL help from a professional helper less often than every month. If the respondent and/or spouse reported receiving ADL help from multiple therapists or other professional helpers, housekeepers/home health care providers, **hWrapcared_s** reflects the highest frequency reported among all professional helpers. **hWrapcared_s** is also coded with a number of special missing values. If the respondent and spouse, if they have a spouse, received no ADL help in the past year and the respondent and/or spouse reported difficulty with at least one

ADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Starting at Wave 6, respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrapcared_s is a flag variable indicating the greatest frequency at which the respondent reported receiving informal care for activities of daily living (ADLs) from a therapist or other professional helper, or housekeeper/home health care provider in the past year and is available starting in Wave 6. The frequency of care received was only asked for care from outside the household. Respondents were instructed to only report care received from inside the household if the care was provided daily or almost daily. A code of 0 indicates the respondent received no ADL help from a professional helper in the past year, the respondent reported receiving some ADL help, and the respondent reported difficulty with at least one ADL. A code of 1 indicates that the respondent received ADL help from a professional helper almost every day either because they said the ADL help received from outside the household was daily or because they received regular ADL help from inside the household. A code of 2 indicates that the respondent received ADL help from a professional helper almost every week. A code of 3 indicates that the respondent received ADL help from a professional helper almost every month. A code of 4 indicates that the respondent received ADL help from a professional helper less often than every month. If the respondent reported receiving ADL help from multiple therapists or other professional helpers, or housekeepers/home health care providers, **rWrapcared_s** reflects the highest frequency reported among all professional helpers. If the respondent received no ADL help in the past year and the respondent reported difficulty with at least one ADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent was not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. Respondents were not asked about help from inside the household if they had no difficulty with both the 10 everyday activities and the 15 ADL and IADL activities previously asked about. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrapcared_s is a flag variable indicating the current wave's spouse's greatest frequency of receiving informal care for activities of daily living (ADLs) from a professional helper. It is taken from the spouse's **rWrapcared_s**. In addition to the special missing values used in **rWrapcared_s**, **sWrapcared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Questions about informal care changed significantly over the waves of SHARE.

In SHARE Waves 1, 2, 4, and 5, the family respondent was asked whether any family member from outside the household or any friend or neighbor gave them or their spouse any kind of help. Starting at Wave 6, all respondents are asked whether any family member from outside the household or any friend or neighbor gave the respondent themselves any kind of help.

The types of help used to define whether any help from outside the household was received include personal care, practical household help and help with paperwork. At Waves 4, 5, and 6, practical household help and help with paperwork were listed together as a single type. In all other waves they were listed as separate types.

In Waves 1 and 2, the family respondent was asked what type of help each helper from outside the household provided from a list of types of help. At Waves 4 and 5, SHARE did not include questions about the type of help provided from outside the household. Starting again at Wave 6, respondents are asked what type of help each helper from outside the household provided. Because the type of help provided by helpers outside of the household is necessary to identify whether the care received was for ADLs, no informal ADL care received variables can be created for Waves 4 or 5.

The lists of relations used to determine who provided the help both from outside and inside the household include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5, these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, housekeepers/home health care providers, and relations not in this list. In Wave 4, respondents can also report which member of their social network provided this help, but the relation types for members of their social network are the same as the relation types used to ask about informal care received, so this change is not expected to have an effect on the harmonized variables of Wave 4. In Waves 6, 8, and 9, respondents are asked whether each relation who provided help was also a member of their social network, but respondents do not directly report that a social network member helped them as they did in Wave 4.

In SHARE Waves 1, 2, 4, and 5, respondents who reported difficulty with at least one of 10 everyday activities previously asked about were asked whether anyone living in the household regularly helped them with personal care. The list of 10 everyday activities included: 1. Walking 100 meters, 2. Sitting for about two hours, 3. Getting up from a chair after sitting for long periods, 4. Climbing several flights of stairs without resting, 5. Climbing one flight of stairs without resting, 6. Stooping, kneeling, or crouching, 7. Reaching or extending your arms above shoulder level, 8. Pulling or pushing large objects like a living room chair, 9. Lifting or carrying weights over 10 pounds/5 kilos, like a heavy bag of groceries, 10. Picking up a small coin from a table. Starting at Wave 6, respondents who reported difficulty with at least one of 10 everyday activities previously asked about or difficulty with at least one of 15 ADL and IADL activities also previously asked about are asked whether anyone living in the household regularly helped them with personal care. The list of 15 additional activities included: 1. Dressing, including putting on shoes and socks, 2. Walking across a room, 3. Bathing or showering, 4. Eating, such as cutting up your food, 5. Getting in or out of bed, 6. Using the toilet, including getting up or down, 7. Using a map to figure out how to get around in a strange place, 8. Preparing a hot meal, 9. Shopping for groceries, 10. Making telephone calls, 11. Taking medications, 12. Doing work around the house or garden, 13. Managing money, such as paying bills and keeping track of expenses, 14. Leaving the house independently and accessing transportation services, 15. Doing personal laundry.

In Waves 1 and 2, SHARE asked how many hours the respondent or the spouse received help from each helper. This was not asked in any following waves.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care.

Cross-Study Differences with the HRS

There are many differences between the questions about informal care received in HRS and SHARE.

Unlike SHARE, HRS did not make a distinction between care received from outside the household vs care received from inside the household.

Unlike SHARE, HRS asks each respondent about informal care received. Not until Wave 6 of SHARE did they start to ask each respondent individually about informal care received from outside the household. As a result, Gateway Harmonized SHARE informal caregiving variables at Waves 1, 2, 4, and 5 are household-level, whereas the comparable variables in the Harmonized HRS are respondent-level.

In SHARE all couples or respondents are asked whether they received care from outside the household and only respondents who reported difficulty with at least one of 10 everyday activities (walking 100 meters, sitting for about two hours, getting up from a chair, climbing several flights of stairs, climbing one flight of stairs, stooping, kneeling, or crouching, reaching or extending your arms, pulling or pushing large objects, lifting or carrying weights over 10 pounds/5 kilos, or picking up a small coin) are asked whether they received care from inside the household. Additionally, starting at SHARE Wave 6, respondents could also report difficulty with one of 15 possible ADLs or IADLs (dressing, walking across a room, bathing, eating, getting in or out of bed, using the toilet, using a map, preparing a hot meal, Shopping for groceries, making telephone calls, taking medications, doing work around the house or garden, managing money, leaving the house independently and accessing transportation services, and doing personal laundry) to be asked whether they received care from inside the household. Differently, in the HRS, respondents who report difficulty with at least one of 6 ADLs (dressing, walking across a room, bathing, eating, getting in and out of bed, and using the toilet) are asked about care received for those ADLs. This difference means that SHARE asks more respondents about care received from outside the household (asked even if they did not have difficulty)

but fewer respondents about care received from inside the household (asked only if they had difficulty with the list of 10 everyday activities).

In SHARE, ADL help from outside the household was asked using the examples of help with dressing, bathing, eating, getting in or out of bed, and using the toilet and ADL help from inside the household was asked using the examples of help with washing, getting out of bed, and dressing. In the HRS ADL help was asked specifically for help with dressing, walking across a room, bathing, eating, getting in and out of bed, and using the toilet.

The HRS allows respondents to list up to 7 helpers for each of the 5 ADLs it asks about. Differently, SHARE allows respondents to list up to 3 helpers for help received outside of the household and asks respondents to identify as many relation types as necessary for help received from inside the household.

The HRS simply asks, "Who most often helps you with [the activities with which they report difficulty]?" The SHARE asks, "Has any family member from outside the household, any friend or neighbour given you any kind of help listed on this card?" and "Is there someone living in this household who has helped you regularly during the last twelve months with personal care?". Because of the difference in question wording, we believe both informal care and formal care are captured in the HRS, while only informal care is captured in the SHARE. As a result, the Harmonized HRS contains **rWracany**, **rWrafaany**, **rWrapfcare**, and **rWraufcare** and related variables, while the Gateway Harmonized SHARE only includes variables for informal care and flag variables for care reported to be from professional sources despite being asked about informal sources of care. The care from professional sources is only considered a flag variable in the Gateway Harmonized SHARE because there could be additional sources of formal care that are not ascertained.

Because in the HRS, respondents are asked to list specific helpers and identify each by relation type, the Harmonized HRS can include counts of the number of helpers for children/grandchildren, relatives, and non-relatives. In SHARE for care received from inside the household, respondents are not asked to identify specific helpers but instead to identify the relation types which help so it is not possible count the number of helpers per relation type. For instance, it is not possible in SHARE to know if one or more than one grandchildren helped the respondent with care.

Since Wave 2, HRS asked respondents how many days per month they received care from each helper and how many hours per day they received care from each helper. In SHARE, for care from outside the household, respondents were asked the frequency of help received using the scale of daily, weekly, monthly, or less for each helper. Only in Waves 1 and 2 of SHARE were respondents asked about hours of care for each helper and in those waves SHARE asked the number of hours given the frequency reported in the previous question.

In SHARE, respondents can report that they received care from a former spouse/partner. Not until Wave 6 of the HRS could HRS respondents report they received care from a former spouse/partner.

In the HRS, respondents can report that they received care from stepchildren since Wave 3. Starting in Wave 6 of the HRS, respondents can also report that they received care from former stepchildren, former children-in-law, and spouses of grandchildren. SHARE allows respondents to report help from a step-child/current partner's child in Wave 4 and starting again in Wave 6.

In the HRS, respondents can report that they receive care from siblings of their spouse since Wave 3. SHARE does not allow respondents to identify helpers as siblings of their spouse but does include grandparents, which is not included in the HRS.

Non-relatives in the Harmonized HRS informal caregiving variables include any other individuals and persons of unknown relations. Non-relatives in the Gateway Harmonized SHARE informal caregiving variables include friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type.

How Constructed

In SHARE Waves 1 and 2, each respondent is asked whether they received any of the kinds of listed care in their home in the last twelve months, including professional or paid nursing or personal care, professional or paid home help for domestic tasks that they could not perform themselves due to health problems, and meals-on-wheels. If the respondent reported receiving professional or paid nursing or personal care, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving professional or paid home help, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving meals-on-wheels, then they are asked how many weeks they received meals-on-wheels in the last twelve months.

In SHARE Waves 1 and 2, each respondent is asked if they received any of the types of care from private providers that they paid themselves or through a private insurance because they would have waited too long or could not get them as much as they needed in the National Health System, and if so, whether they received home care or paid home help. Because there are no questions ascertaining the type of care the respondent received, these questions contribute only to help received for combined ADL and IADL variables, but do not contribute to help received for separate ADL and IADL variables.

Starting in SHARE Wave 5, each respondent is asked whether they received any professional or paid services of the kinds of listed care in their home in the last twelve months due to a physical, mental, emotional or memory problem, including help with personal care (e.g. getting in and out of bed, dressing, bathing and showering), help with domestic tasks (cleaning, ironing, cooking), meals-on-wheels (i.e. ready made meals provided by a municipality or a private provider), and help with other activities (e.g. filling a drug dispenser). Starting in Wave 7, if the respondent reported receiving professional or paid help with personal care, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving professional or paid help for domestic tasks, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving meals-on-wheels, then they are asked how many weeks they received meals-on-wheels in the last twelve months.

hWrafaany indicates whether the respondent and/or spouse received any formal care for ADLs in their home in the last year. In Waves 1 and 2, this includes professional or paid nursing or personal care. Starting in Wave 5, this includes professional or paid services for help with personal care. A code of 0 is used if the respondent and spouse, if they have a spouse, received no formal help for ADLs in the past year and the respondent and/or spouse reported difficulty with at least one ADL. A code of 1 is used if the respondent or spouse, if they have a spouse, did receive formal help for ADLs in the past year, regardless of whether they reported difficulty with an ADL. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL and did not receive any formal help, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse received formal care, special missing (.b) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **hWrafaany** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so

special missing (.e) is assigned. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. These questions are not asked at all in Wave 4 and so **hWrfaany** is not available in Wave 4.

rWrfaany indicates whether the respondent received any formal care for ADLs in their home in the last year. In Waves 1 and 2, this includes professional or paid nursing or personal care. Starting in Wave 5, this includes professional or paid services for help with personal care. A code of 1 is used if the respondent received formal help for ADLs in the past year, regardless of whether they reported difficulty with an ADL. A code of 0 is used if the respondent received no formal help for ADLs in the past year and the respondent reported difficulty with at least one ADL. If the respondent reported that they had no difficulty with any ADL and did not receive any formal help, special missing (.x) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **rWrfaany** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned in these cases. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. These questions are not asked at all in Wave 4 and so **rWrfaany** is not available in Wave 4.

sWrfaany indicates whether the current wave's spouse received any formal care for ADLs. It is taken from the spouse's **rWrfaany**. In addition to the special missing values used in **rWrfaany**, **sWrfaany** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Please note that when asked about receiving informal care specifically, respondents are able to report that a therapist or other professional helper, or a housekeeper/home health care provider, either from outside or inside the household, provided help in the last year. Because these responses are based on questions asking specifically about informal care, these reports have not been incorporated into the variables listed here. Rather, these responses have been used to create **rWrapcare**. Please see "Section L: Receives Informal Care for ADLs" for more information on this variable.

rWrapufcarewpy indicates the number of weeks per year the respondent received formal help for ADLs in their home. In Waves 1 and 2, help received within the home for ADLs includes professional or paid nursing or personal care. If the respondent reported receiving this type of care in their home, the respondent is asked how many weeks they received that help in their home in the last year. Starting in Wave 7, help received within the home for ADLs includes professional or paid services for help with personal care. If the respondent reported receiving this type of care in their home, the respondent is asked how many weeks they received that help in their home in the last year.

rWrapufcarewpy indicates the number of weeks of formal help for ADLs reported. **rWrapufcarewpy** is assigned a value of 0 if the respondent did not receive any formal help for ADLs and reported difficulty with at least one ADL. If the respondent reported having difficulty with at least one ADL but receiving no help for ADLs (formal or informal), then **rWrapufcarewpy** is assigned special missing (.h). At Wave 7, respondents who were given the condensed survey were not asked about informal caregiving so (.h) is not assigned for this part of the Wave 7 sample (identified by **inw7c**) and instead these respondents who had a difficulty with an ADL but didn't received formal care are assigned a 0 value. If the respondent reported that they had no difficulty with any ADL and did not receive any formal help with ADLs, special missing (.x) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **rWrapufcarewpy** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned in these cases. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. The number of weeks per year of help is only asked in Waves 1 and 2 and starting in Wave 7.

sWrapufcarewpy indicates the number of weeks of formal help for ADLs reported by the current wave's spouse. It is taken from the spouse's **rWrapufcarewpy**. In addition to the special missing values used by **rWrapufcarewpy**, **sWrapufcarewpy** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when

the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWrapufcarehpw indicates the number of hours per week the respondent received formal help in their home. In Waves 1 and 2, help received within the home for ADLs includes professional or paid nursing or personal care. If the respondent reported receiving this type of care in their home, the respondent is asked how many hours per week on average they received that help in their home in the last year. Starting in Wave 7, help received within the home for ADLs includes professional or paid services for help with personal care. If the respondent reported receiving this type of care in their home, the respondent is asked how many weeks they received that help in their home in the last year.

rWrapufcarehpw indicates the number of hours per week of formal help for ADLs reported. **rWrapufcarehpw** is assigned a value of 0 if the respondent did not receive any formal help for ADLs and reported difficulty with at least one ADL. If the respondent reported having difficulty with at least one ADL but receiving no help for ADLs (formal or informal), then **rWrapufcarehpw** is assigned special missing (.h). At Wave 7, respondents who were given the condensed survey were not asked about informal caregiving so (.h) is not assigned for this part of the Wave 7 sample (identified by **inw7c**) and instead these respondents who had a difficulty with an ADL but didn't receive formal care are assigned a 0 value. If the respondent reported that they had no difficulty with any ADL and did not receive any formal help with ADLs, special missing (.x) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **rWrapufcarehpw** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned in these cases. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. The number of hours per week of help is only asked in Waves 1 and 2 and starting in Wave 7.

sWrapufcarehpw indicates the number of hours per week of formal help for ADLs reported by the current wave's spouse. It is taken from the spouse's **rWrapufcarehpw**. In addition to the special missing values used by **rWrapufcarehpw**, **sWrapufcarehpw** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Waves 1 and 2, respondents who do not live permanently in nursing homes are asked if they received any of the following types of care in their own home in the last twelve months: professional or paid nursing or personal care, professional or paid home help for domestic tasks that they could not perform themselves due to health problems, meals-on-wheels, or none of these. The number of weeks of help in the last year was asked for personal care, domestic tasks, and meals-on-wheels, while the number of hours per week on average of help in the last year was asked only for personal care and domestic tasks.

In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care from providers in their home. Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland.

In Waves 1 and 2, respondents are also shown a list and asked whether they received any of these types of care from private providers that they paid themselves or through private insurance because they would have waited too long or could not get them as much as they needed in the National Health System. The list includes options for home care and paid home help, among others. The respondent is not asked any further questions about the frequency of care received.

No questions about formal help received are asked in Wave 4.

Starting in Wave 5, all respondents are asked whether they received any professional or paid services of the kinds of listed care in their home in the last twelve months due to a physical, mental, emotional or memory problem. The list includes: help with personal care (e.g. getting in and out of bed, dressing, bathing and showering), help with domestic tasks (cleaning, ironing, cooking), meals-on-wheels (i.e. ready made meals provided by a municipality or a private provider), and help with other activities (e.g. filling a drug dispenser).

Starting in Wave 7, respondents who receive professional or paid services in their home for personal care, domestic tasks, or meals-on-wheels are asked the number of weeks per year they received help. Respondents who receive professional or paid services in their home for personal care or domestic tasks are asked the average number of hours per week they received help.

Also starting in Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care. Because it is not possible to capture informal caregiving patterns at Wave 7 for those respondent who received the condensed questionnaire, .h can not be not assigned in **r7rapufcarewpy** and **r7rapufcarehpw** for this part of the Wave 7 sample (identified by **inw7c**), instead these respondents who had a difficulty with an ADL but didn't received formal care are assigned a 0 value.

Cross-Study Differences with the HRS

There are many differences between the questions about formal care received in HRS and SHARE.

While SHARE asks questions about formal care received regardless of difficulty with ADLs or IADLs, HRS only asks questions about care received if the respondent reported difficulty with at least one ADL or IADL. As a result, Gateway Harmonized SHARE variables are assigned special missing (.x) if they report no difficulty and receive no help, but are assigned a value of 1 if they report receiving help even if they report having no difficulty. Harmonized HRS variables are assigned a value of 1 if they report receiving help and having difficulty.

HRS asks for the relationship of each helper and whether that helper is paid, allowing for the creation of additional variables in the Harmonized HRS that cannot be constructed with the given information in the Gateway Harmonized SHARE. The Harmonized HRS and Gateway Harmonized SHARE both include **rWrafaany**, but the Harmonized HRS also includes variables describing the respondent's experience with paid and unpaid formal helpers.

The HRS allows respondents to list up to 7 helpers for each of the 5 ADLs it asks about. Differently, SHARE does not allow respondents to list the number of formal helpers, and only asks what type of activities they helped with.

The HRS asks about the frequency of care received in days per month and hours per day, while the SHARE asks about the frequency of formal care received in weeks per year and hours per week. As such, adjustment must be made before comparison of the help frequency variables.

Receives Any Care for ADLs

Variable	Waves	Label	Type
hWracany	1-2, 6-9	hWracany:WW recv any care for ADLs	Categ
rWracany	6-9	rWracany:WW r recv any care for ADLs	Categ
sWracany	6-9	sWracany:WW s recv any care for ADLs	Categ

How Constructed

hWracany summarizes whether the respondent and/or spouse received any formal or informal care for activities of daily living (ADL) in the last year. In Waves 1 and 2, formal care for ADLs can include professional or paid nursing or personal care received at home in the past year. Starting in Wave 5, formal care for ADLs includes professional or paid services for help with personal care received at home in the past year. In all waves, informal care for ADLs includes care from outside or inside the household for help with personal care in the last year. **hWracany** is assigned a code of 0 if the respondent and spouse, if they have a spouse, received no formal or informal care for ADLs in the past year and the respondent and/or spouse reported difficulty with at least one ADL. **hWracany** is assigned a code of 1 if the respondent and/or spouse received either formal or informal care for ADLs in the past year. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any ADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with personal care from inside or outside the household or from formal providers, special missing (.b) is assigned. If the respondent and/or spouse were not asked whether they received help from inside the household but did have difficulty with an ADL, special missing (.s) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **hWracany** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked questions about formal care in Greece and Switzerland, and so special missing (.e) is assigned. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked questions about formal care and are assigned special missing (.n). Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWracany summarizes whether the respondent received any formal or informal care for ADLs in the last year and is available starting in Wave 6. Formal care includes professional or paid services for help with personal care received at home in the past year. Informal care includes care from outside or inside the household with personal care in the last year. **rWracany** is assigned a code of 0 if the respondent received no formal or informal care in the past year and the respondent reported difficulty with at least one ADL. **rWracany** is assigned a code of 1 if the respondent received either formal or informal care in the past year. If the respondent reported that they had no difficulty with any ADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWracany indicates whether the current wave's spouse received any formal or informal care for ADLs. It is taken from the spouse's **rWracany**. In addition to the special missing values used in **rWracany**, **sWracany** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWracany summarizes the information provided by **hWracaany** and **hWrafaany**, while **rWracany** summarizes the information provided by **rWracaany** and **rWrafaany**. For more information on these comprising variables, please see the preceding pages of this section of the codebook "Receives Any Informal Care for ADLs" and "Receives Any Formal Care for ADLs".

Cross Wave Differences in SHARE

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care. Because it is not possible to capture informal caregiving patterns

at Wave 7 for those respondent who received the condensed questionnaire, **h7racany**, **r7racany**, and **s7racany** are only available for those respondents who completed the regular questionnaire.

Please also see the preceding sections for a detailed explanation of differences between waves.

Cross-Study Differences with the HRS

Questions on help received for difficulties with ADLs are asked solely at the respondent level in the HRS, whereas questions on help received in the SHARE are asked at the couple level and respondent level and are not always dependent on reporting difficulty with ADLs. As such, the Harmonized HRS includes only respondent level variables, whereas the Gateway Harmonized SHARE includes both couple and respondent level variables depending on how the information was collected over the waves. Variables in the Gateway Harmonized SHARE have been built to be as comparable as possible to variables of the same name in the Harmonized HRS, however, respondents who report receiving care in SHARE are assigned a value of 1 regardless of whether they report difficulty with an ADL, which would not occur in the Harmonized HRS variables.

Please see preceding sections for a detailed explanation of differences between the Harmonized HRS and Gateway Harmonized SHARE.

How Constructed

In SHARE Waves 1, 2, 4, and 5, the family respondent was asked whether any family member from outside the household or any friend or neighbor gave them or their spouse any kind of help during the last twelve months from a list of types of help, including personal care, practical household help, and help with paperwork. If the respondent answered yes, they were then asked, for up to 3 people, who, from a list of relations, provided the help and how often the help was received by the respondent or the spouse from that person in the last twelve months, whether daily, weekly, monthly, or less. Respondents are instructed to start with the person who helped most often. In Waves 1 and 2, SHARE also asked how many hours the respondent or the spouse received help from that person altogether on a typical day, week, month, or in the last year, depending on the periodicity of the help indicated in the previous question. Also in Waves 1 and 2, the family respondent was asked what type of help the person provided from a list of types of help. The respondent could select personal care, practical household help, and/or help with paperwork, and they could select as many types as the person provided.

Starting at Wave 6, all respondents are asked whether any family member from outside the household or any friend or neighbor gave them any kind of help during the last twelve months from a list of types of help, including personal care, practical household help, and help with paperwork. If the respondent answered yes, they were then asked, for up to 3 people, who, from a list of relations, provided the help and how often the help was received by the respondent from that person in the last twelve months, whether daily, weekly, monthly, or less. Respondents are instructed to start with the person who helped most often. The respondent is then asked what type of help the person provided from a list of types of help. The respondent could select personal care, practical household help, and/or help with paperwork, and they could select as many types as the person provided. In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care.

At no waves did SHARE include questions about help with instrumental activities of daily living (IADLs) from inside the household.

The types of help used to define whether any help from outside the household was received include personal care, practical household help and help with paperwork. The examples given for personal care from outside the household include help with dressing, bathing or showering, eating, getting in or out of bed, and using the toilet. The examples given for practical household help from outside the household include help with home repairs, gardening, transportation, shopping, and household chores. The examples given for help with paperwork from outside the household include help with filling out forms, and settling financial or legal matters. At Waves 4, 5, and 6, practical household help and help with paperwork were listed together as a single type. In all other waves they were listed as separate types.

The lists of relations used to determine who provided the help both from outside and inside the household include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5, these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, housekeepers/home health care providers, and relations not in this list.

hWricaany indicates whether the respondent and/or spouse received any informal care for instrumental activities of daily living (IADLs) from outside the household in the last year. **hWricaany** is available at Waves 1 and 2 and then at Wave 6 and all following waves. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent and/or spouse received any IADL help in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWricaany indicates whether the respondent received any informal care for instrumental activities of daily living (IADLs) from outside the household in the last year and is available starting in Wave 6. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent received any IADL help in the past year. A code of 0 is used if the respondent received no IADL help in the past year and the respondent reported difficulty with at least one IADL. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWricaany indicates whether the current wave's spouse received any informal care for instrumental activities of daily living (IADLs). It is taken from the spouse's **rWricaany**. In addition to the special missing values used in **rWricaany**, **sWricaany** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWriscare indicates whether the respondent and/or spouse received any informal care for instrumental activities of daily living (IADLs) from a spouse/partner or ex-spouse/partner, from outside the household in the last year. **hWriscare** is available at Waves 1 and 2 and then at Wave 6 and all following waves. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent and/or spouse received any IADL help from a spouse in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no IADL help from a spouse in the past year, the respondent and/or spouse reported receiving some IADL help, and the respondent and/or spouse reported difficulty with at least one IADL. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWriscare indicates whether the respondent received any informal care for instrumental activities of daily living (IADLs) from a spouse/partner or ex-spouse/partner, from outside the household in the last year and is available starting in Wave 6. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent received any IADL help from a spouse in the past year. A code of 0 is used if the respondent received no IADL help from a spouse in the past year, the respondent reported receiving some IADL help, and the respondent reported difficulty with at least one IADL. If the respondent received no IADL help in the past year and the respondent reported difficulty with at least one IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWriscare indicates whether the current wave's spouse received any informal care for instrumental activities of daily living (IADLs) from a spouse. It is taken from the spouse's **rWriscare**. In addition to the special missing values used in **rWriscare**, **sWriscare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWriscared_s indicates the greatest frequency at which the respondent and/or spouse received informal care for instrumental activities of daily living (IADLs) from a spouse/partner or ex-spouse/partner in the past year. **hWriscared_s** is available at Waves 1 and 2 and then at Wave 6 and all following waves. A code of 0 indicates the respondent and spouse, if they have a spouse, received no IADL help from a spouse in the past year, the respondent and/or spouse reported receiving some IADL help, and the respondent and/or spouse reported difficulty with at least one IADL. A code of 1 indicates that the respondent and/or spouse received IADL help from a spouse almost every day. A code of 2 indicates that the respondent and/or spouse received IADL help from a spouse almost every week. A code of 3 indicates that the respondent and/or spouse received IADL help from a spouse almost every month. A code of 4 indicates that the respondent and/or spouse received IADL help from a spouse less often than every month. If the respondent and/or spouse reported receiving IADL help from multiple spouse/partners or ex-spouse/partners, **hWriscared_s** reflects the highest frequency reported among all spouses. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWriscared_s indicates the greatest frequency at which the respondent received informal care for instrumental activities of daily living (IADLs) from a spouse/partner or ex-spouse/partner in the past year and is available starting in Wave 6. A code of 0 indicates the respondent received no IADL help from a spouse in the past year, the respondent reported receiving some IADL help, and the respondent reported difficulty with at least one IADL. A code of 1 indicates that the respondent received IADL help from a spouse almost every day. A code of 2 indicates that the respondent received IADL help from a spouse almost every week. A code of 3 indicates that the respondent received IADL help from a spouse almost every month. A code of 4 indicates that the respondent received IADL help from a spouse less often than every month. If the respondent reported receiving IADL help from multiple spouse/partners or ex-spouse/partners, **rWriscared_s** reflects the highest frequency reported among all spouses. If the respondent received no IADL help in the past year and the respondent reported difficulty with at least one IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWriscared_s indicates the current wave's spouse's greatest frequency of receiving informal care for instrumental activities of daily living (IADLs) from a spouse. It is taken from the spouse's **rWriscared_s**. In addition to the special missing values used in **rWriscared_s**, **sWriscared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWriscarehr captures the total hours per day the respondent and/or spouse received informal care for instrumental ac-

tivities of daily living (IADLs) from spouse/partners or ex-spouse/partners, from outside the household in the past year and is only available in Waves 1 and 2. SHARE asked how many hours the respondent and/or spouse received IADL help from outside the household from each of the 3 possible helpers on a typical day, week, month, or in the last year, depending on the periodicity of the help previously indicated. **hWriscarehr** is derived by adjusting the reported hours by the previously indicated periodicity so that all values are expressed in hours per day. This means: if the respondent and/or spouse received care from a spouse almost every week, then the hours reported are divided by 7; if the respondent and/or spouse received care from a spouse almost every month, then the hours reported are divided by 30; if the respondent and/or spouse received care from a spouse less often than every month, then the hours reported are divided by 365. If the respondent and/or spouse reported receiving IADL help from multiple spouse/partners or ex-spouse/partners, **hWriscarehr** reflects the total hours reported for all spouses. If the respondent reported that any single spouse helped with IADLs more than 24 hours a day, that report is not used in the calculation of **hWriscarehr**. Special missing (.i) is used if the only report of hours of IADL care received from a spouse was considered invalid as it was greater than 24 hours a day. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWriccare indicates whether the respondent and/or spouse received any informal care for instrumental activities of daily living (IADLs) from a child, child-in-law, or grandchild, from outside the household in the last year. **hWriccare** is available at Waves 1 and 2 and then at Wave 6 and all following waves. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent and/or spouse received any IADL help from a child/grandchild in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no IADL help from a child/grandchild in the past year, the respondent and/or spouse reported receiving some IADL help, and the respondent and/or spouse reported difficulty with at least one IADL. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWriccare indicates whether the respondent received any informal care for instrumental activities of daily living (IADLs) from a child, child-in-law, or grandchild, from outside the household in the last year and is available starting in Wave 6. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent received any IADL help from a child/grandchild in the past year. A code of 0 is used if the respondent received no IADL help from a child/grandchild in the past year, the respondent reported receiving some IADL help, and the respondent reported difficulty with at least one IADL. If the respondent received no IADL help in the past year and the respondent reported difficulty with at least one IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWriccare indicates whether the current wave's spouse received any informal care for instrumental activities of daily living (IADLs) from a child/grandchild. It is taken from the spouse's **rWriccare**. In addition to the special missing values used in **rWriccare**, **sWriccare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWriccared_s indicates the greatest frequency at which the respondent and/or spouse received informal care for instrumental activities of daily living (IADLs) from a child, child-in-law, or grandchild in the past year. **hWriccared_s** is available at Waves 1 and 2 and then at Wave 6 and all following waves. A code of 0 indicates the respondent and spouse, if they have

a spouse, received no IADL help from a child/grandchild in the past year, the respondent and/or spouse reported receiving some IADL help, and the respondent and/or spouse reported difficulty with at least one IADL. A code of 1 indicates that the respondent and/or spouse received IADL help from a child/grandchild almost every day. A code of 2 indicates that the respondent and/or spouse received IADL help from a child/grandchild almost every week. A code of 3 indicates that the respondent and/or spouse received IADL help from a child/grandchild almost every month. A code of 4 indicates that the respondent and/or spouse received IADL help from a child/grandchild less often than every month. If the respondent and/or spouse reported receiving IADL help from multiple children, children-in-law, or grandchildren, **hWriccared_s** reflects the highest frequency reported among all children/grandchildren. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWriccared_s indicates the greatest frequency at which the respondent received informal care for instrumental activities of daily living (IADLs) from a child, child-in-law, or grandchild in the past year and is available starting in Wave 6. A code of 0 indicates the respondent received no IADL help from a child/grandchild in the past year, the respondent reported receiving some IADL help, and the respondent reported difficulty with at least one IADL. A code of 1 indicates that the respondent received IADL help from a child/grandchild almost every day. A code of 2 indicates that the respondent received IADL help from a child/grandchild almost every week. A code of 3 indicates that the respondent received IADL help from a child/grandchild almost every month. A code of 4 indicates that the respondent received IADL help from a child/grandchild less often than every month. If the respondent reported receiving IADL help from multiple children, children-in-law, or grandchildren, **rWriccared_s** reflects the highest frequency reported among all children/grandchildren. If the respondent received no IADL help in the past year and the respondent reported difficulty with at least one IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWriccared_s indicates the current wave's spouse's greatest frequency of receiving informal care for instrumental activities of daily living (IADLs) from a child/grandchild. It is taken from the spouse's **rWriccared_s**. In addition to the special missing values used in **rWriccared_s**, **sWriccared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWriccarehr captures the total hours per day the respondent and/or spouse received informal care for instrumental activities of daily living (IADLs) from children/grandchildren, from outside the household in the past year and is only available in Waves 1 and 2. SHARE asked how many hours the respondent and/or spouse received IADL help from outside the household from each of the 3 possible helpers on a typical day, week, month, or in the last year, depending on the periodicity of the help previously indicated. **hWriccarehr** is derived by adjusting the reported hours by the previously indicated periodicity so that all values are expressed in hours per day. This means: if the respondent and/or spouse received care from a child/grandchild almost every week, then the hours reported are divided by 7; if the respondent and/or spouse received care from a child/grandchild almost every month, then the hours reported are divided by 30; if the respondent and/or spouse received care from a child/grandchild less often than every month, then the hours reported are divided by 365. If the respondent and/or spouse reported receiving IADL help from multiple children, children-in-law, or grandchildren, **hWriccarehr** reflects the total hours reported for all children/grandchildren. If the respondent reported that any single child/grandchild helped with IADLs more than 24 hours a day, that report is not used in the calculation of **hWriccarehr**. Special missing (.i) is used if the only report of hours of IADL care received from a child/grandchild was considered invalid as it was greater than 24 hours a day. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Don't know, refused, or missing responses are assigned special

missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWrircare indicates whether the respondent and/or spouse received any informal care for instrumental activities of daily living (IADLs) from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative, from outside the household in the last year. **hWrircare** is available at Waves 1 and 2 and then at Wave 6 and all following waves. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent and/or spouse received any IADL help from a relative in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no IADL help from a relative in the past year, the respondent and/or spouse reported receiving some IADL help, and the respondent and/or spouse reported difficulty with at least one IADL. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrircare indicates whether the respondent received any informal care for instrumental activities of daily living (IADLs) from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative, from outside the household in the last year and is available starting in Wave 6. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent received any IADL help from a relative in the past year. A code of 0 is used if the respondent received no IADL help from a relative in the past year, the respondent reported receiving some IADL help, and the respondent reported difficulty with at least one IADL. If the respondent received no IADL help in the past year and the respondent reported difficulty with at least one IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrircare indicates whether the current wave's spouse received any informal care for instrumental activities of daily living (IADLs) from a relative. It is taken from the spouse's **rWrircare**. In addition to the special missing values used in **rWrircare**, **sWrircare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrircared_s indicates the greatest frequency at which the respondent and/or spouse received informal care for instrumental activities of daily living (IADLs) from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative in the past year. **hWrircared_s** is available at Waves 1 and 2 and then at Wave 6 and all following waves. A code of 0 indicates the respondent and spouse, if they have a spouse, received no IADL help from a relative in the past year, the respondent and/or spouse reported receiving some IADL help, and the respondent and/or spouse reported difficulty with at least one IADL. A code of 1 indicates that the respondent and/or spouse received IADL help from a relative almost every day. A code of 2 indicates that the respondent and/or spouse received IADL help from a relative almost every week. A code of 3 indicates that the respondent and/or spouse received IADL help from a relative almost every month. A code of 4 indicates that the respondent and/or spouse received IADL help from a relative less often than every month. If the respondent and/or spouse reported receiving IADL help from multiple parents, parents-in-law, stepparents, siblings, grandparents, other relatives, **hWrircared_s** reflects the highest frequency reported among all relatives. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrircared_s indicates the greatest frequency at which the respondent received informal care for instrumental activities

of daily living (IADLs) from a parent, parent-in-law, stepparent, sibling, grandparent, or other relative in the past year and is available starting in Wave 6. A code of 0 indicates the respondent received no IADL help from a relative in the past year, the respondent reported receiving some IADL help, and the respondent reported difficulty with at least one IADL. A code of 1 indicates that the respondent received IADL help from a relative almost every day. A code of 2 indicates that the respondent received IADL help from a relative almost every week. A code of 3 indicates that the respondent received IADL help from a relative almost every month. A code of 4 indicates that the respondent received IADL help from a relative less often than every month. If the respondent reported receiving IADL help from multiple parents, parents-in-law, stepparents, siblings, grandparents, other relatives, **rWircared_s** reflects the highest frequency reported among all relatives. If the respondent received no IADL help in the past year and the respondent reported difficulty with at least one IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWircared_s indicates the current wave's spouse's greatest frequency of receiving informal care for instrumental activities of daily living (IADLs) from a relative. It is taken from the spouse's **rWircared_s**. In addition to the special missing values used in **rWircared_s**, **sWircared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWircarehr captures the total hours per day the respondent and/or spouse received informal care for instrumental activities of daily living (IADLs) from relatives, from outside the household in the past year and is only available in Waves 1 and 2. SHARE asked how many hours the respondent and/or spouse received IADL help from outside the household from each of the 3 possible helpers on a typical day, week, month, or in the last year, depending on the periodicity of the help previously indicated. **hWircarehr** is derived by adjusting the reported hours by the previously indicated periodicity so that all values are expressed in hours per day. This means: if the respondent and/or spouse received care from a relative almost every week, then the hours reported are divided by 7; if the respondent and/or spouse received care from a relative almost every month, then the hours reported are divided by 30; if the respondent and/or spouse received care from a relative less often than every month, then the hours reported are divided by 365. If the respondent and/or spouse reported receiving IADL help from multiple parents, parents-in-law, stepparents, siblings, grandparents, other relatives, **hWircarehr** reflects the total hours reported for all relatives. If the respondent reported that any single relative helped with IADLs more than 24 hours a day, that report is not used in the calculation of **hWircarehr**. Special missing (.i) is used if the only report of hours of IADL care received from a relative was considered invalid as it was greater than 24 hours a day. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWrifcare indicates whether the respondent and/or spouse received any informal care for instrumental activities of daily living (IADLs) from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type, from outside the household in the last year. **hWrifcare** is available at Waves 1 and 2 and then at Wave 6 and all following waves. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent and/or spouse received any IADL help from a non-relative in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no IADL help from a non-relative in the past year, the respondent and/or spouse reported receiving some IADL help, and the respondent and/or spouse reported difficulty with at least one IADL. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrifcare indicates whether the respondent received any informal care for instrumental activities of daily living (IADLs) from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type, from outside the household in the last year and is available starting in Wave 6. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent received any IADL help from a non-relative in the past year. A code of 0 is used if the respondent received no IADL help from a non-relative in the past year, the respondent reported receiving some IADL help, and the respondent reported difficulty with at least one IADL. If the respondent received no IADL help in the past year and the respondent reported difficulty with at least one IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrifcare indicates whether the current wave's spouse received any informal care for instrumental activities of daily living (IADLs) from a non-relative. It is taken from the spouse's **rWrifcare**. In addition to the special missing values used in **rWrifcare**, **sWrifcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrifcared_s indicates the greatest frequency at which the respondent and/or spouse received informal care for instrumental activities of daily living (IADLs) from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type in the past year. **hWrifcared_s** is available at Waves 1 and 2 and then at Wave 6 and all following waves. A code of 0 indicates the respondent and spouse, if they have a spouse, received no IADL help from a non-relative in the past year, the respondent and/or spouse reported receiving some IADL help, and the respondent and/or spouse reported difficulty with at least one IADL. A code of 1 indicates that the respondent and/or spouse received IADL help from a non-relative almost every day. A code of 2 indicates that the respondent and/or spouse received IADL help from a non-relative almost every week. A code of 3 indicates that the respondent and/or spouse received IADL help from a non-relative almost every month. A code of 4 indicates that the respondent and/or spouse received IADL help from a non-relative less often than every month. If the respondent and/or spouse reported receiving IADL help from multiple friends, colleagues, neighbors, clergy, other acquaintances, or persons of unlisted relation type, **hWrifcared_s** reflects the highest frequency reported among all non-relatives. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWrifcared_s indicates the greatest frequency at which the respondent received informal care for instrumental activities of daily living (IADLs) from a friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type in the past year and is available starting in Wave 6. A code of 0 indicates the respondent received no IADL help from a non-relative in the past year, the respondent reported receiving some IADL help, and the respondent reported difficulty with at least one IADL. A code of 1 indicates that the respondent received IADL help from a non-relative almost every day. A code of 2 indicates that the respondent received IADL help from a non-relative almost every week. A code of 3 indicates that the respondent received IADL help from a non-relative almost every month. A code of 4 indicates that the respondent received IADL help from a non-relative less often than every month. If the respondent reported receiving IADL help from multiple friends, colleagues, neighbors, clergy, other acquaintances, or persons of unlisted relation type, **rWrifcared_s** reflects the highest frequency reported among all non-relatives. If the respondent received no IADL help in the past year and the respondent reported difficulty with at least one IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWrifcared_s indicates the current wave's spouse's greatest frequency of receiving informal care for instrumental ac-

tivities of daily living (IADLs) from a non-relative. It is taken from the spouse's **rWrficared_s**. In addition to the special missing values used in **rWrficared_s**, **sWrficared_s** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWrficarehr captures the total hours per day the respondent and/or spouse received informal care for instrumental activities of daily living (IADLs) from non-relatives, from outside the household in the past year and is only available in Waves 1 and 2. SHARE asked how many hours the respondent and/or spouse received IADL help from outside the household from each of the 3 possible helpers on a typical day, week, month, or in the last year, depending on the periodicity of the help previously indicated. **hWrficarehr** is derived by adjusting the reported hours by the previously indicated periodicity so that all values are expressed in hours per day. This means: if the respondent and/or spouse received care from a non-relative almost every week, then the hours reported are divided by 7; if the respondent and/or spouse received care from a non-relative almost every month, then the hours reported are divided by 30; if the respondent and/or spouse received care from a non-relative less often than every month, then the hours reported are divided by 365. If the respondent and/or spouse reported receiving IADL help from multiple friends, colleagues, neighbors, clergy, other acquaintances, or persons of unlisted relation type, **hWrficarehr** reflects the total hours reported for all non-relatives. If the respondent reported that any single non-relative helped with IADLs more than 24 hours a day, that report is not used in the calculation of **hWrficarehr**. Special missing (.i) is used if the only report of hours of IADL care received from a non-relative was considered invalid as it was greater than 24 hours a day. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

hWripcare is a flag variable indicating whether the respondent and/or spouse reported receiving any informal care for instrumental activities of daily living (IADLs) from a therapist or other professional helper, or housekeeper/home health care provider, from outside the household in the last year. **hWripcare** is available starting at Wave 6. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent and/or spouse received any IADL help from a professional helper in the past year. A code of 0 is used if the respondent and spouse, if they have a spouse, received no IADL help from a professional helper in the past year, the respondent and/or spouse reported receiving some IADL help, and the respondent and/or spouse reported difficulty with at least one IADL. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWripcare is a flag variable indicating whether the respondent reported receiving any informal care for instrumental activities of daily living (IADLs) from a therapist or other professional helper, or housekeeper/home health care provider, from outside the household in the last year and is available starting in Wave 6. IADL help from outside the household could have been help with practical household help or help with paperwork. A code of 1 is used if the respondent received any IADL help from a professional helper in the past year. A code of 0 is used if the respondent received no IADL help from a professional helper in the past year, the respondent reported receiving some IADL help, and the respondent reported difficulty with at least one IADL. If the respondent received no IADL help in the past year and the respondent reported difficulty with at least one IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWripcare is a flag variable indicating whether the current wave's spouse reported receiving any informal care for instrumental activities of daily living (IADLs) from a professional helper. It is taken from the spouse's **rWripcare**. In addition to the special missing values used in **rWripcare**, **sWripcare** employs two additional special missing codes, (.u) and (.v). A

special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWripcares is a flag variable indicating the greatest frequency at which the respondent and/or spouse reported receiving informal care for instrumental activities of daily living (IADLs) from a therapist or other professional helper, or housekeeper/home health care provider in the past year. **hWripcares** is available starting at Wave 6. A code of 0 indicates the respondent and spouse, if they have a spouse, received no IADL help from a professional helper in the past year, the respondent and/or spouse reported receiving some IADL help, and the respondent and/or spouse reported difficulty with at least one IADL. A code of 1 indicates that the respondent and/or spouse received IADL help from a professional helper almost every day. A code of 2 indicates that the respondent and/or spouse received IADL help from a professional helper almost every week. A code of 3 indicates that the respondent and/or spouse received IADL help from a professional helper almost every month. A code of 4 indicates that the respondent and/or spouse received IADL help from a professional helper less often than every month. If the respondent and/or spouse reported receiving IADL help from multiple therapists or other professional helpers, or housekeepers/home health care providers, **hWripcares** reflects the highest frequency reported among all professional helpers. If the respondent and spouse, if they have a spouse, received no IADL help in the past year and the respondent and/or spouse reported difficulty with at least one IADL, special missing (.h) is assigned. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help starting in Wave 6, special missing (.b) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWripcares is a flag variable indicating the greatest frequency at which the respondent reported receiving informal care for instrumental activities of daily living (IADLs) from a therapist or other professional helper, or housekeeper/home health care provider in the past year and is available starting in Wave 6. A code of 0 indicates the respondent received no IADL help from a professional helper in the past year, the respondent reported receiving some IADL help, and the respondent reported difficulty with at least one IADL. A code of 1 indicates that the respondent received IADL help from a professional helper almost every day. A code of 2 indicates that the respondent received IADL help from a professional helper almost every week. A code of 3 indicates that the respondent received IADL help from a professional helper almost every month. A code of 4 indicates that the respondent received IADL help from a professional helper less often than every month. If the respondent reported receiving IADL help from multiple therapists or other professional helpers, or housekeepers/home health care providers, **rWripcares** reflects the highest frequency reported among all professional helpers. If the respondent received no IADL help in the past year and the respondent reported difficulty with at least one IADL, special missing (.h) is assigned. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWripcares is a flag variable indicating the current wave's spouse's greatest frequency of receiving informal care for instrumental activities of daily living (IADLs) from a professional helper. It is taken from the spouse's **rWripcares**. In addition to the special missing values used in **rWripcares**, **sWripcares** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Questions about informal care changed significantly over the waves of SHARE.

In SHARE Waves 1, 2, 4, and 5, the family respondent was asked whether any family member from outside the household or any friend or neighbor gave them or their spouse any kind of help. Starting at Wave 6, all respondents are asked whether any family member from outside the household or any friend or neighbor gave the respondent themselves any kind of help.

The types of help used to define whether any help from outside the household was received include personal care, practical household help and help with paperwork. At Waves 4, 5, and 6, practical household help and help with paperwork were

listed together as a single type. In all other waves, they were listed as separate types.

In Waves 1 and 2, the family respondent was asked what type of help each helper from outside the household provided from a list of types of help. At Waves 4 and 5, SHARE did not include questions about the type of help provided from outside the household. Starting again at Wave 6, respondents are asked what type of help each helper from outside the household provided. Because the type of help provided by helpers outside of the household is necessary to identify whether the care received was for IADLs, no informal IADL care received variables can be created for Waves 4 or 5.

The lists of relations used to determine who provided the help both from outside the household include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5 these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, housekeepers/home health care providers, and relations not in this list. In Wave 4, respondents can also report which member of their social network provided this help, but the relation types for members of their social network are the same as the relation types used to ask about informal care received, so this change is not expected to have an effect on the harmonized variables of Wave 4. In Waves 6, 8, and 9, respondents are asked whether each relation who provided help was also a member of their social network, but respondents do not directly report that a social network member helped them as they did in Wave 4.

In Waves 1 and 2, SHARE asked how many hours the respondent or the spouse received help from each helper. This was not asked in any following waves.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care.

In Waves 1, 2, 4, and 5, SHARE asked about 7 instrumental activities of daily living (IADLs). These were: using a map to figure out how to get around in a strange place, preparing a hot meal, shopping for groceries, making telephone calls, taking medications, doing work around the house or garden, managing money, such as paying bills and keeping track of expenses. Starting at Wave 6, in addition to these 7 IADLS, SHARE also asks about two additional IADLS. Those are: leaving the house independently and accessing transportation services, and doing personal laundry. For all informal IADL care received variables this changing set of IADLS are used to identify couples and respondents who had no difficulty with any IADL, using special missing (.x).

Cross-Study Differences with the HRS

There are many differences between the questions about informal care received in HRS and SHARE.

Unlike SHARE, HRS did not make a distinction between care received from outside the household vs care received from inside the household. As HRS did not have this distinction, the comparable variables in the Harmonized HRS capture IADL caregiving from both outside and inside the household whereas the informal IADL care received variables in the Gateway Harmonized SHARE do not capture IADL caregiving from inside the household as it was not asked about in SHARE.

Unlike SHARE, HRS asks each respondent about informal care received. Not until Wave 6 of SHARE did they start to ask each respondent individually about informal care received from outside the household. As a result, Gateway Harmonized SHARE informal caregiving variables at Waves 1, 2, 4, and 5 are household-level, whereas the comparable variables in the Harmonized HRS are respondent-level.

In SHARE all couples or respondents are asked whether they received care from outside the household. Differently, in the HRS, respondents who report difficulty with at least one of 4 IADLs (preparing meals, grocery shopping, making phone calls, and taking medications) are asked about care received for those IADLs and respondents who report difficulty with the IADL of managing money are asked about care received for managing money. This difference means that SHARE asks more respondents about care received from outside the household (asked even if they did not have difficulty) but, as noted above, SHARE does not ask about IADL care received from inside the household.

In SHARE, IADL help from outside the household could have been help with practical household help or help with paperwork. The examples given for practical household help include help with home repairs, gardening, transportation, shopping, household chores. The examples given for help with paperwork include help with filling out forms, settling financial or legal

matters. In the HRS, IADL help was asked specifically for help with preparing meals, grocery shopping, making phone calls, taking medications, and managing money.

The HRS allows respondents to list up to 7 helpers for each of the 5 ADLs it asks about, up to 6 helpers for each of the 5 IADLs (besides managing money), and up to 2 helpers for managing money. Differently, SHARE allows respondents to list up to 3 helpers for help received outside of the household.

The HRS simply asks, "Who most often helps you with [the activities with which they report difficulty]?" The SHARE asks, "Has any family member from outside the household, any friend or neighbour given you any kind of help listed on this card?". Because of the difference in question wording, we believe both informal care and formal care are captured in the HRS, while only informal care is captured in the SHARE. As a result, the Harmonized HRS contains **rWricany**, **rWrifaany**, **rWripfcare**, and **rWriufcare** and related variables, while the Gateway Harmonized SHARE only includes variables for informal care and flag variables for care reported to be from professional sources despite being asked about informal sources of care. The care from professional sources is only considered a flag variable in the Gateway Harmonized SHARE because there could be additional sources of formal care that are not ascertained.

Since Wave 2, HRS asked respondents how many days per month they received care from each helper and how many hours per day they received care from each helper. In SHARE, for care from outside the household, respondents were asked the frequency of help received using the scale of daily, weekly, monthly, or less for each helper. Only in Waves 1 and 2 of SHARE were respondents asked about hours of care for each helper and in those waves SHARE asked the number of hours given the frequency reported in the previous question.

In SHARE, respondents can report that they received care from a former spouse/partner. Not until Wave 6 of the HRS could HRS respondents report they received care from a former spouse/partner.

In the HRS, respondents can report that they received care from stepchildren since Wave 3. Starting in Wave 6 of the HRS, respondents can also report that they received care from former stepchildren, former children-in-law, and spouses of grandchildren. SHARE allows respondents to report help from a step-child/current partner's child in Wave 4 and starting again in Wave 6.

In the HRS, respondents can report that they receive care from siblings of their spouse since Wave 3. SHARE does not allow respondents to identify helpers as siblings of their spouse but does include grandparents, which is not included in the HRS.

Non-relatives in the Harmonized HRS informal caregiving variables include any other individuals and persons of unknown relations. Non-relatives in the Gateway Harmonized SHARE informal caregiving variables include friend, colleague, neighbor, clergy, other acquaintance, or person of unlisted relation type.

How Constructed

In SHARE Waves 1 and 2, each respondent is asked whether they received any of the kinds of listed care in their home in the last twelve months, including professional or paid nursing or personal care, professional or paid home help for domestic tasks that they could not perform themselves due to health problems, and meals-on-wheels. If the respondent reported receiving professional or paid nursing or personal care, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving professional or paid home help, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving meals-on-wheels, then they are asked how many weeks they received meals-on-wheels in the last twelve months.

In SHARE Waves 1 and 2, each respondent is asked if they received any of the types of care from private providers that they paid themselves or through a private insurance because they would have waited too long or could not get them as much as they needed in the National Health System, and if so, whether they received home care or paid home help. Because there are no questions ascertaining the type of care the respondent received, these questions contribute only to help received for combined ADL and IADL variables, but do not contribute to help received for separate ADL and IADL variables.

Starting in SHARE Wave 5, each respondent is asked whether they received any professional or paid services of the kinds of listed care in their home in the last twelve months due to a physical, mental, emotional or memory problem, including help with personal care (e.g. getting in and out of bed, dressing, bathing and showering), help with domestic tasks (cleaning, ironing, cooking), meals-on-wheels (i.e. ready made meals provided by a municipality or a private provider), and help with other activities (e.g. filling a drug dispenser). Starting in Wave 7, if the respondent reported receiving professional or paid help with personal care, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving professional or paid help for domestic tasks, then they are asked how many weeks they received this care in their home in the last twelve months and how many hours per week it was received. If the respondent reported receiving meals-on-wheels, then they are asked how many weeks they received meals-on-wheels in the last twelve months.

hWrifaany indicates whether the respondent and/or spouse received any formal care for IADLs in their home in the last year. In Waves 1 and 2, this can include professional or paid home help for domestic tasks or meals-on-wheels. Starting in Wave 5, this includes professional or paid services for help with domestic tasks, meals-on-wheels, or help with other activities. A code of 0 is used if the respondent and spouse, if they have a spouse, received no formal help for IADLs in the past year and the respondent and/or spouse reported difficulty with at least one IADL. A code of 1 is used if the respondent or spouse, if they have a spouse, did receive formal help for IADLs in the past year, regardless of whether they reported difficulty with an IADL. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL and did not receive any formal help, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse received formal care, special missing (.b) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **hWrifaany** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not

living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. These questions are not asked at all in Wave 4 and so **hWrifaany** is not available in Wave 4.

rWrifaany indicates whether the respondent received any formal care for IADLs in their home in the last year. In Waves 1 and 2, this can include professional or paid home help for domestic tasks or meals-on-wheels. Starting in Wave 5, this includes professional or paid services for help with domestic tasks, meals-on-wheels, or help with other activities. A code of 1 is used if the respondent received any type of formal help for IADLs in the past year, regardless of whether they reported difficulty with an IADL. A code of 0 is used if the respondent received no formal help for IADLs in the past year and the respondent reported difficulty with at least one IADL. If the respondent reported that they had no difficulty with any IADL and did not receive any formal help for IADLs, special missing (.x) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **rWrifaany** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned in these cases. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. These questions are not asked at all in Wave 4 and so **rWrifaany** is not available in Wave 4.

sWrifaany indicates whether the current wave's spouse received any formal care for IADLs. It is taken from the spouse's **rWrifaany**. In addition to the special missing values used in **rWrifaany**, **sWrifaany** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Please note that when asked about receiving informal care specifically, respondents are able to report that a therapist or other professional helper, or a housekeeper/home health care provider, either from outside or inside the household, provided help in the last year. Because these responses are based on questions asking specifically about informal care, these reports have not been incorporated into the variables listed here. Rather, these responses have been used to create **rWripicare**. Please see "Section L: Receives Informal Care for IADLs" for more information on this variable.

rWripufcarewpy indicates the total number of weeks per year the respondent received formal help for IADLs in their home. In Waves 1 and 2, help received within the home for IADLs includes professional or paid home help for domestic tasks or meals-on-wheels. For each type of formal help for IADLs the respondent reported receiving in their home, the respondent is asked how many weeks they received that help in their home in the last year. Starting in Wave 7, help received within the home for IADLs includes professional or paid services for help with domestic tasks, meals-on-wheels, or help with other activities. For help with domestic tasks or meals-on-wheels, the respondent is asked how many weeks they received that help in their home in the last year. The number of weeks per year of help is not asked if the respondent received help with other activities.

rWripufcarewpy sums the number of weeks of formal help for IADLs reported for each type of formal help received, and so values can be over 52. **rWripufcarewpy** is assigned a value of 0 if the respondent did not receive any formal help for IADLs and reported difficulty with at least one IADL. It is assigned special missing (.w) starting in Wave 7 if the respondent only received help with other activities and so the number of weeks of help was not asked. If the respondent reported having difficulty with at least one IADL but receiving no help for IADLs (formal or informal), then **rWripufcarewpy** is assigned special missing (.h). At Wave 7, respondents who were given the condensed survey were not asked about informal caregiving so (.h) is not assigned for this part of the Wave 7 sample (identified by **inw7c**) and instead these respondents who had a difficulty with an IADL but didn't receive formal care are assigned a 0 value. If the respondent reported that they had no difficulty with any IADL and did not receive any formal help for IADLs, special missing (.x) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **rWripufcarewpy** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned in these cases. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d),

(.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. The number of weeks per year of help is only asked in Waves 1 and 2 and starting in Wave 7.

sWripufcarewpy sums the number of weeks of formal help for IADLs reported for each type of formal help received by the current wave's spouse. It is taken from the spouse's **rWripufcarewpy**. In addition to the special missing values used by **rWripufcarewpy**, **sWripufcarewpy** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWripufcarehpw indicates the total number of hours per week the respondent received formal help for IADLs in their home. In Waves 1 and 2, help received for IADLs within the home includes professional or paid home help for domestic tasks or meals-on-wheels. For professional or paid home help for domestic tasks, the respondent is asked how many hours per week on average they received that help in their home in the last year. The number of hours per week of help is not asked if the respondent received meals-on-wheels. Starting in Wave 7, help received for IADLs within the home includes professional or paid services for help with domestic tasks, meals-on-wheels, or help with other activities. For help with domestic tasks, the respondent is asked how many weeks they received that help in their home in the last year. The number of weeks per year of help is not asked if the respondent received meals-on-wheels or help with other activities.

rWripufcarehpw sums the number of hours per week of formal help for IADLs reported for each type of formal help received, and so values can be over 168. **rWripufcarehpw** is assigned a value of 0 if the respondent did not receive any formal help for IADLs and reported difficulty with at least one IADL. **rWripufcarehpw** is assigned special missing (.p) in Waves 1 and 2 if the respondent only received formal help from meals-on-wheels and so the number of hours per week of help was not asked. It is assigned special missing (.w) starting in Wave 7 if the respondent only received meals-on-wheels or help with other activities and so the number of hours per week of help was not asked. If the respondent reported having difficulty with at least one IADL but receiving no help for IADLs (formal or informal), then **rWripufcarehpw** is assigned special missing (.h). At Wave 7, respondents who were given the condensed survey were not asked about informal caregiving so (.h) is not assigned for this part of the Wave 7 sample (identified by **inw7c**) and instead these respondents who had a difficulty with an IADL but didn't receive formal care are assigned a 0 value. If the respondent reported that they had no difficulty with any IADL and did not receive any formal help for IADLs, special missing (.x) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **rWripufcarehpw** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland, and so special missing (.e) is assigned in these cases. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked these questions and are assigned special missing (.n). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave. The number of hours per week of help is only asked in Waves 1 and 2 and starting in Wave 7.

sWripufcarehpw sums the number of hours per week of formal help for IADLs reported for each type of formal help received by the current wave's spouse. It is taken from the spouse's **rWripufcarehpw**. In addition to the special missing values used by **rWripufcarehpw**, **sWripufcarehpw** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Waves 1 and 2, respondents who do not live permanently in nursing homes are asked if they received any of the following types of care in their own home in the last twelve months: professional or paid nursing or personal care, professional or paid home help for domestic tasks that they could not perform themselves due to health problems, meals-on-wheels, or none of these. The number of weeks of help in the last year was asked for personal care, domestic tasks, and meals-on-wheels, while the number of hours per week on average of help in the last year was asked only for personal care and domestic tasks.

In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care from providers in their home. Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked these questions in Greece and Switzerland.

In Waves 1 and 2, respondents are also shown a list and asked whether they received any of these types of care from private

providers that they paid themselves or through private insurance because they would have waited too long or could not get them as much as they needed in the National Health System. The list includes options for home care and paid home help, among others. The respondent is not asked any further questions about the frequency of care received.

No questions about formal help received are asked in Wave 4.

Starting in Wave 5, all respondents are asked whether they received any professional or paid services of the kinds of listed care in their home in the last twelve months due to a physical, mental, emotional or memory problem. The list includes: help with personal care (e.g. getting in and out of bed, dressing, bathing and showering), help with domestic tasks (cleaning, ironing, cooking), meals-on-wheels (i.e. ready made meals provided by a municipality or a private provider), and help with other activities (e.g. filling a drug dispenser).

Starting in Wave 7, respondents who receive professional or paid services in their home for personal care, domestic tasks, or meals-on-wheels are asked the number of weeks per year they received help. Respondents who receive professional or paid services in their home for personal care or domestic tasks are asked the average number of hours per week they received help.

Also starting in Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care. Because it is not possible to capture informal caregiving patterns at Wave 7 for those respondent who received the condensed questionnaire, (.h) can not be not assigned in **r7ripufcarewpy** and **r7ripufcarehpy** for this part of the Wave 7 sample (identified by **inw7c**), instead these respondents who had a difficulty with an IADL but didn't received formal care are assigned a 0 value.

Cross-Study Differences with the HRS

There are many differences between the questions about formal care received in HRS and SHARE.

While SHARE asks questions about formal care received regardless of difficulty with ADLs or IADLs, HRS only asks questions about care received if the respondent reported difficulty with at least one ADL or IADL. As a result, Gateway Harmonized SHARE variables are assigned special missing (.x) if they report no difficulty and receive no help, but are assigned a value of 1 if they report receiving help even if they report having no difficulty. Harmonized HRS variables are assigned a value of 1 if they report receiving help and having difficulty.

HRS asks for the relationship of each helper and whether that helper is paid, allowing for the creation of additional variables in the Harmonized HRS that cannot be constructed with the given information in the Gateway Harmonized SHARE. The Harmonized HRS and Gateway Harmonized SHARE both include **rWrfany**, but the Harmonized HRS also includes variables describing the respondent's experience with paid and unpaid formal helpers.

The HRS allows respondents to list up to 6 helpers for each of the 5 IADLs (besides managing money), and up to 2 helpers for managing money. Differently, SHARE does not allow respondents to list the number of formal helpers, and only asks what type of activities they helped with.

The HRS asks about the frequency of care received in days per month and hours per day, while the SHARE asks about the frequency of formal care received in weeks per year and hours per week. As such, adjustment must be made before comparison of the help frequency variables.

Receives Any Care for IADLs

Variable	Waves	Label	Type
hWricany	1-2, 6-9	hWricany:WW recv any care for IADLs	Categ
rWricany	6-9	rWricany:WW r recv any care for IADLs	Categ
sWricany	6-9	sWricany:WW s recv any care for IADLs	Categ

How Constructed

hWricany summarizes whether the respondent and/or spouse received any formal or informal care for instrumental activities of daily living (IADL) in the last year. In Waves 1 and 2, formal care for IADLs can include professional or paid home help for domestic tasks or meals-on-wheels received at home in the past year. Starting in Wave 5, formal care for IADLs includes professional or paid services for help with domestic tasks, meals-on-wheels, or help with other activities received at home in the past year. In all waves, informal care for IADLs includes practical household help or help with paperwork from outside the household. **hWricany** is assigned a code of 0 if the respondent and spouse, if they have a spouse, received no formal or informal care for IADLs in the past year and the respondent and/or spouse reported difficulty with at least one IADL. **hWricany** is assigned a code of 1 if the respondent and/or spouse received either formal or informal care for IADLs in the past year. If both the respondent and spouse, if they have a spouse, reported that they had no difficulty with any IADL, special missing (.x) is assigned. If the respondent's spouse did not respond to the survey and it is unknown whether the respondent's spouse needed or received help with activities other than personal care from outside the household or from formal providers, special missing (.b) is assigned. In Wave 1, respondents in Austria, Germany and Belgium were not asked whether they received formal care, and **hWricany** is set to special missing (.q). Also in Wave 1, there was an error in the skip pattern leading respondents who reported not living or staying in a nursing home to not be asked questions about formal care in Greece and Switzerland, and so special missing (.e) is assigned. In Waves 1 and 2, respondents who reported living in a nursing home permanently were not asked questions about formal care and are assigned special missing (.n). Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

rWricany summarizes whether the respondent received any formal or informal care in the last year and is available starting in Wave 6. Formal care for IADLs includes professional or paid services for help with domestic tasks, meals-on-wheels, or help with other activities received at home in the past year. Informal care for IADLs includes practical household help or help with paperwork from outside the household. **rWricany** is assigned a code of 0 if the respondent received no formal or informal care for IADLs in the past year and the respondent reported difficulty with at least one IADL. **rWricany** is assigned a code of 1 if the respondent received either formal or informal care for IADLs in the past year. If the respondent reported that they had no difficulty with any IADL, special missing (.x) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWricany indicates whether the current wave's spouse received any formal or informal care for IADLs. It is taken from the spouse's **rWricany**. In addition to the special missing values used in **rWricany**, **sWricany** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

hWricany summarizes the information provided by **hWricaany** and **hWrifaany**, while **rWricany** summarizes the information provided by **rWricaany** and **rWrifaany**. For more information on these comprising variables, please see the preceding pages of this section of the codebook "Receives Any Informal Care for IADLs" and "Receives Any Formal Care for IADLs".

Cross Wave Differences in SHARE

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about receiving any informal care. Because it is not possible to capture informal caregiving patterns

at Wave 7 for those respondent who received the condensed questionnaire, **h7ricany**, **r7ricany**, and **s7ricany** are only available for those respondents who completed the regular questionnaire.

Please also see the preceding sections for a detailed explanation of differences between waves.

Cross-Study Differences with the HRS

Questions on help received for difficulties with IADLs are asked solely at the respondent level in the HRS, whereas questions on help received in the SHARE are asked at the couple level and respondent level and are not always dependent on reporting difficulty with IADLs. As such, the Harmonized HRS includes only respondent level variables, whereas the Gateway Harmonized SHARE includes both couple and respondent level variables depending on how the information was collected over the waves. Variables in the Gateway Harmonized SHARE have been built to be as comparable as possible to variables of the same name in the Harmonized HRS, however, respondents who report receiving care in SHARE are assigned a value of 1 regardless of whether they report difficulty with an IADL, which would not occur in the Harmonized HRS variables.

Please see preceding sections for a detailed explanation of differences between the Harmonized HRS and Gateway Harmonized SHARE.

How Constructed

In SHARE Waves 1 and 2, all respondents were asked whether they personally gave any kind of help during the last twelve months from a list of types of help, including personal care, practical household help, and help with paperwork, to a family member from outside the household or a friend or neighbor. If the respondent answered yes, they were then asked, for up to 3 people, who, from a list of relations, they provided help to. Respondents were instructed to start with the person who they helped the most often. All respondents who did not live alone were then asked whether there was anyone living in the household whom they regularly helped with personal care in the last twelve months. Regular care was defined as daily or almost daily care for at least three months. If the respondent answered yes, they were then asked who, from a list of relations, they provided help to, and they could select as many relations as they provided help to.

In SHARE Waves 4 and 5, the family respondent was asked whether they personally gave any kind of help during the last twelve months from a list of types of help, including personal care, practical household help, and help with paperwork, to a family member from outside the household or a friend or neighbor. If the respondent answered yes, they were then asked, for up to 3 people, who, from a list of relations, they provided help to. Respondents were instructed to start with the person who they helped the most often. In Wave 5, respondents were also instructed to exclude looking after grandchildren as they would be asked about that later. Then all respondents who did not live alone were asked whether there was anyone living in the household whom they regularly helped with personal care in the last twelve months. Regular care was defined as daily or almost daily care for at least three months. If the respondent answered yes, they were then asked who, from a list of relations, they provided help to, and they could select as many relations as they provided help to.

Starting at Wave 6, all respondents are asked whether they personally gave any kind of help during the last twelve months from a list of types of help, including personal care, practical household help, and help with paperwork, to a family member from outside the household or a friend or neighbor. If the respondent answers yes, they are then asked, for up to 3 people, who, from a list of relations, they provided help to. Respondents are instructed to start with the person who they helped the most often. Respondents are also instructed to exclude looking after grandchildren as they would be asked about that later. Then all respondents who did not live alone are asked whether there is anyone living in the household whom they regularly helped with personal care in the last twelve months. Regular care is defined as daily or almost daily care for at least three months. If the respondent answers yes, they are then asked who, from a list of relations, they provided help to, and they can select as many relations as they provided help to. In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about providing any informal care.

The types of help used to define whether any help was given to people outside the household include personal care, practical household help and help with paperwork. The examples given for personal care include help with dressing, bathing or showering, eating, getting in or out of bed, or using the toilet. The examples given for practical household help include help with home repairs, gardening, transportation, shopping, or household chores. The examples given for help with paperwork

include help with filling out forms, or settling financial or legal matters. At Waves 4, 5, and 6, practical household help and help with paperwork were listed together as a single type. In all other waves they were listed as separate types. The examples given to determine whether any personal care was given to people inside the household include help with washing, getting out of bed, or dressing.

The lists of relations used to determine who from both outside and inside the household was given help include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5, these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, housekeepers/home health care providers, and relations not in this list.

rWgcare indicates whether the respondent gave any informal care to anyone from outside the household or within the household, in the last year. Help to someone outside the household could have been help with personal care, practical household help, or help with paperwork. Help to someone inside the household only included help with personal care. A code of 1 is used if the respondent reports that they provided help to someone. A code of 0 is used if the respondent reports that they did not provide help to anyone. At Waves 4 and 5, if the respondent was not asked whether they provided care to anyone outside the household or whether they looked after their grandchildren as they were not the family respondent, special missing (.n) is assigned. At Waves 4 and 5, if the respondent was not asked whether they provided care to anyone outside the household as they were not the family respondent, special missing (.n) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgcare indicates whether the current wave's spouse gave any informal care. It is taken from the spouse's **rWgcare**. In addition to the special missing values used in **rWgcare**, **sWgcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgscare indicates whether the respondent provided any informal care to a spouse/partner or ex-spouse/partner, either from outside or inside the household in the past year. Help to someone outside the household could have been help with personal care, practical household help, or help with paperwork. Help to someone inside the household only included help with personal care. A code of 1 is used if the respondent reports that they provided help to a spouse. A code of 0 is used if the respondent did not provide any help to a spouse and the respondent has a spouse/partner in the current wave. If the respondent is separated, divorced, widowed, or never married and is not coupled with anyone in the current wave, special missing (.s) is assigned. At Waves 4 and 5, if the respondent was not asked whether they provided care to anyone outside the household as they were not the family respondent, special missing (.n) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgscare indicates whether the current wave's spouse provided any informal care to a spouse. It is taken from the spouse's **rWgscare**. In addition to the special missing values used in **rWgscare**, **sWgscare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgccare indicates whether the respondent provided any informal care to a child or child-in-law, either from outside or inside the household in the past year. Help to someone outside the household could have been help with personal care, practical household help, or help with paperwork. Help to someone inside the household only included help with personal care. A code of 1 is used if the respondent reports that they provided help to a child. A code of 0 is used if the respondent did not provide any help to a child and the respondent has one or more living children in the current wave. If the respondent does not have any living children in the current wave, special missing (.k) is assigned. At Waves 4 and 5, if the respondent was not asked whether they provided care to anyone outside the household as they were not the family respondent, special missing (.n) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

swgccare indicates whether the current wave's spouse provided any informal care to a child. It is taken from the spouse's **rwgccare**. In addition to the special missing values used in **rwgccare**, **swgccare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rwgkcare indicates whether the respondent provided any informal care to a grandchild, either from outside or inside the household in the past year. Help to someone outside the household could have been help with personal care, practical household help, or help with paperwork. Help to someone inside the household only included help with personal care. A code of 1 is used if the respondent reports that they provided help to a grandchild. A code of 0 is used if the respondent did not provide any help to a grandchild and the respondent has one or more living grandchildren in the current wave. If the respondent does not have any living grandchildren in the current wave, special missing (.g) is assigned. At Waves 4 and 5, if the respondent was not asked whether they provided care to anyone outside the household as they were not the family respondent, special missing (.n) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

swgkcare indicates whether the current wave's spouse provided any informal care to a grandchild. It is taken from the spouse's **rwgkcare**. In addition to the special missing values used in **rwgkcare**, **swgkcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rwgrcare indicates whether the respondent provided any informal care to a parent, parent-in-law, stepparent, sibling, grandparent, or other relative, either from outside or inside the household in the past year. Help to someone outside the household could have been help with personal care, practical household help, or help with paperwork. Help to someone inside the household only included help with personal care. A code of 1 is used if the respondent reports that they provided help to a relative. A code of 0 is used if the respondent did not provide any help to a relative. At Waves 4 and 5, if the respondent was not asked whether they provided care to anyone outside the household as they were not the family respondent, special missing (.n) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

swgrcare indicates whether the current wave's spouse provided any informal care to a relative. It is taken from the spouse's **rwgrcare**. In addition to the special missing values used in **rwgrcare**, **swgrcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rwgfcare indicates whether the respondent provided any informal care to a friend, colleague, neighbor, clergy, therapist or other professional helper, housekeeper/home health care provider, other acquaintance, or person of unlisted relation type, either from outside or inside the household in the past year. Help to someone outside the household could have been help with personal care, practical household help, or help with paperwork. Help to someone inside the household only included help with personal care. A code of 1 is used if the respondent reports that they provided help to a non-relative. A code of 0 is used if the respondent did not provide any help to a non-relative. At Waves 4 and 5, if the respondent was not asked whether they provided care to anyone outside the household as they were not the family respondent, special missing (.n) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

swgfcare indicates whether the current wave's spouse provided any informal care to a non-relative. It is taken from the spouse's **rwgfcare**. In addition to the special missing values used in **rwgfcare**, **swgfcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Questions about informal care changed significantly over the waves of SHARE.

In SHARE Waves 1 and 2, all respondents were asked whether they personally gave any kind of help to a person outside of the household. In SHARE Waves 4 and 5, only the family respondent was asked whether they personally gave any kind of help to a person outside of the household. Starting at Wave 6, again all respondents were asked whether they personally gave any kind of help to a person outside of the household.

Starting in Wave 5, when asking about help given to people outside the household, respondents are instructed to exclude looking after grandchildren as they would be asked about that later.

The types of help used to define whether any help was given to people outside the household include personal care, practical household help and help with paperwork. At Waves 4, 5, and 6, practical household help and help with paperwork were listed together as a single type. In all other waves they were listed as separate types.

The lists of relations used to determine who help was provided to, both for people from outside and inside the household, include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5, these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, housekeepers/home health care providers, and relations not in this list. In Wave 4, respondents can also report which member of their social network provided this help, but the relation types for members of their social network are the same as the relation types used to ask about informal care received, so this change is not expected to have an effect on the harmonized variables of Wave 4.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about providing any informal care.

Cross-Study Differences with the HRS

The Harmonized HRS includes **hwgpcare**, which indicates care given to parents by the respondent or spouse. The Gateway Harmonized SHARE indicates care given by the respondent only and includes additional variables indicating other relationships that the respondent provides care to which are absent in the Harmonized HRS. Additionally, parents are included in care to relatives in the Gateway Harmonized SHARE.

Unlike SHARE, HRS did not make a distinction between care given from outside the household vs care given from inside the household. As HRS did not have this distinction, the comparable variables in the Harmonized HRS capture care given from both outside and inside the household whereas the care given variables in the Gateway Harmonized SHARE do not capture IADL care given from inside the household as it was not asked about in SHARE.

How Constructed

In SHARE Waves 1 and 2, all respondents were asked whether they personally gave personal care, during the last twelve months, to a family member from outside the household or a friend or neighbor. If the respondent answered yes, they were then asked, for up to 3 people, who, from a list of relations, they provided help to. Respondents were instructed to start with the person who they helped the most often. All respondents who did not live alone were then asked whether there was anyone living in the household whom they regularly helped with personal care in the last twelve months. Regular care was defined as daily or almost daily care for at least three months. If the respondent answered yes, they were then asked who, from a list of relations, they provided help to, and they could select as many relations as they provided help to.

In SHARE Waves 4 and 5, all respondents who did not live alone were asked whether there was anyone living in the household whom they regularly helped with personal care in the last twelve months. In Waves 4 and 5, they are not asked about giving personal care to anyone outside the household. Regular care was defined as daily or almost daily care for at least three months. If the respondent answered yes, they were then asked who, from a list of relations, they provided help to, and they could select as many relations as they provided help to.

Starting at Wave 6, all respondents are asked whether they personally gave personal care, during the last twelve months, to a family member from outside the household or a friend or neighbor. If the respondent answers yes, they are then asked, for up to 3 people, who, from a list of relations, they provided help to. Respondents are instructed to start with the person who they helped the most often. Then all respondents who did not live alone are asked whether there is anyone living in the household whom they regularly helped with personal care in the last twelve months. Regular care is defined as daily or almost daily care for at least three months. If the respondent answers yes, they are then asked who, from a list of relations, they provided help to, and they can select as many relations as they provided help to.

The examples given for personal care include help with dressing, bathing or showering, eating, getting in or out of bed, or using the toilet. The examples given to determine whether any personal care was given to people inside the household include help with washing, getting out of bed, or dressing.

The lists of relations used to determine who from both outside and inside the household was given help include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5, these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, housekeepers/home health care providers, and relations not in this list.

rWgacare indicates whether the respondent gave any personal care to anyone from outside the household or within the household, in Waves 1-2 and 6-9, and whether the respondent gave any personal care to anyone within the household, in Waves 4 and 5, in the last year. A code of 1 is used if the respondent reports that they provided personal care to someone.

A code of 0 is used if the respondent reports that they did not provide personal care to anyone. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgacare indicates whether the current wave's spouse gave any personal care. It is taken from the spouse's **rWgacare**. In addition to the special missing values used in **rWgacare**, **sWgacare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgascare indicates whether the respondent provided any personal care to a spouse/partner or ex-spouse/partner, either from outside or inside the household in the past year. In Waves 4 and 5, this only refers to care provided inside the household. A code of 1 is used if the respondent reports that they provided help to a spouse. A code of 0 is used if the respondent did not provide any help to a spouse and the respondent has a spouse/partner in the current wave. If the respondent is separated, divorced, widowed, or never married and is not coupled with anyone in the current wave, special missing (.s) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgascare indicates whether the current wave's spouse provided any personal care to a spouse. It is taken from the spouse's **rWgascare**. In addition to the special missing values used in **rWgascare**, **sWgascare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgaccare indicates whether the respondent provided any personal care to a child or child-in-law, either from outside or inside the household in the past year. In Waves 4 and 5, this only refers to care provided inside the household. A code of 1 is used if the respondent reports that they provided help to a child. A code of 0 is used if the respondent did not provide any help to a child and the respondent has one or more living children in the current wave. If the respondent does not have any living children in the current wave, special missing (.k) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgaccare indicates whether the current wave's spouse provided any personal care to a child. It is taken from the spouse's **rWgaccare**. In addition to the special missing values used in **rWgaccare**, **sWgaccare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgakcare indicates whether the respondent provided any personal care to a grandchild, either from outside or inside the household in the past year. In Waves 4 and 5, this only refers to care provided inside the household. A code of 1 is used if the respondent reports that they provided help to a grandchild. A code of 0 is used if the respondent did not provide any help to a grandchild and the respondent has one or more living grandchildren in the current wave. If the respondent does not have any living grandchildren in the current wave, special missing (.g) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgakcare indicates whether the current wave's spouse provided any personal care to a grandchild. It is taken from the spouse's **rWgakcare**. In addition to the special missing values used in **rWgakcare**, **sWgakcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgarcare indicates whether the respondent provided any personal care to a parent, parent-in-law, stepparent, sibling, grandparent, or other relative, either from outside or inside the household in the past year. In Waves 4 and 5, this only refers

to care provided inside the household. A code of 1 is used if the respondent reports that they provided help to a relative. A code of 0 is used if the respondent did not provide any help to a relative. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

swgarcare indicates whether the current wave's spouse provided any personal care to a relative. It is taken from the spouse's **rwgarcare**. In addition to the special missing values used in **rwgarcare**, **swgarcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rwgafcare indicates whether the respondent provided any personal care to a friend, colleague, neighbor, clergy, therapist or other professional helper, housekeeper/home health care provider, other acquaintance, or person of unlisted relation type, either from outside or inside the household in the past year. In Waves 4 and 5, this only refers to care provided inside the household. A code of 1 is used if the respondent reports that they provided help to a non-relative. A code of 0 is used if the respondent did not provide any help to a non-relative. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

swgafcare indicates whether the current wave's spouse provided any personal care to a non-relative. It is taken from the spouse's **rwgafcare**. In addition to the special missing values used in **rwgafcare**, **swgafcare** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Questions about personal care changed significantly over the waves of SHARE.

In SHARE Waves 1 and 2, all respondents were asked whether they personally gave any kind of help to a person outside of the household or inside of the household. In SHARE Waves 4 and 5, the respondent was only asked about personal care provided to someone inside the household. Starting at Wave 6, again all respondents were asked whether they personally gave any kind of help to a person outside of the household or inside of the household.

The lists of relations used to determine who help was provided to, both for people from outside and inside the household, include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5, these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, housekeepers/home health care providers, and relations not in this list. In Wave 4, respondents can also report which member of their social network provided this help, but the relation types for members of their social network are the same as the relation types used to ask about informal care received, so this change is not expected to have an effect on the harmonized variables of Wave 4.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about providing any personal care.

Cross-Study Differences with the HRS

The Harmonized HRS includes **hwgapcare**, which indicates personal care given to parents by the respondent or spouse. The Gateway Harmonized SHARE indicates personal care given by the respondent only and includes additional variables indicating other relationships that the respondent provides care to which are absent in the Harmonized HRS. Additionally, parents are included in care to relatives in the Gateway Harmonized SHARE.

Unlike SHARE, HRS did not make a distinction between care given from outside the household vs care given from inside the household. As HRS did not have this distinction, the comparable variables in the Harmonized HRS capture care given from

both outside and inside the household whereas the care given variables in the Gateway Harmonized SHARE do not capture IADL care given from inside the household as it was not asked about in SHARE.

How Constructed

In SHARE Waves 1 and 2 and again starting in Wave 6, all respondents were asked whether they personally gave assistance with chores, during the last twelve months, including practical household help and help with paperwork, to a family member from outside the household or a friend or neighbor. If the respondent answered yes, they were then asked, for up to 3 people, who, from a list of relations, they provided help to. Respondents were instructed to start with the person who they helped the most often. Regular care was defined as daily or almost daily care for at least three months. If the respondent answered yes, they were then asked who, from a list of relations, they provided help to, and they could select as many relations as they provided help to.

In SHARE Waves 4 and 5, respondents were not asked about giving anyone practical household help or help with paperwork.

The examples given for practical household help include help with home repairs, gardening, transportation, shopping, or household chores. The examples given for help with paperwork include help with filling out forms, or settling financial or legal matters.

The lists of relations used to determine who from both outside and inside the household was given help include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5, these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, housekeepers/home health care providers, and relations not in this list.

rWgchore indicates whether the respondent gave any help with chores to anyone from outside the household, in the last year. A code of 1 is used if the respondent reports that they provided help with chores to someone. A code of 0 is used if the respondent reports that they did not provide help with chores to anyone. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgchore indicates whether the current wave's spouse gave help with chores. It is taken from the spouse's **rWgchore**. In addition to the special missing values used in **rWgchore**, **sWgchore** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgschore indicates whether the respondent gave any help with chores to a spouse/partner or ex-spouse/partner, from outside the household, in the last year. A code of 1 is used if the respondent reports that they provided help with chores to a spouse. A code of 0 is used if the respondent reports that they did not provide help with chores to a spouse and the

respondent has a spouse/partner in the current wave. If the respondent is separated, divorced, widowed, or never married and is not coupled with anyone in the current wave, special missing (.s) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgschore indicates whether the current wave's spouse gave help with chores to a spouse. It is taken from the spouse's **rWgschore**. In addition to the special missing values used in **rWgschore**, **sWgschore** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgcchore indicates whether the respondent gave any help with chores to a child or child-in-law, from outside the household, in the last year. A code of 1 is used if the respondent reports that they provided help with chores to a child. A code of 0 is used if the respondent reports that they did not provide help with chores to a child and the respondent has one or more living children in the current wave. If the respondent does not have any living children in the current wave, special missing (.k) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgcchore indicates whether the current wave's spouse gave help with chores to a child. It is taken from the spouse's **rWgcchore**. In addition to the special missing values used in **rWgcchore**, **sWgcchore** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgkchore indicates whether the respondent gave any help with chores to a grandchild, from outside the household, in the last year. A code of 1 is used if the respondent reports that they provided help with chores to a grandchild. A code of 0 is used if the respondent reports that they did not provide help with chores to a grandchild and the respondent has one or more living grandchildren in the current wave. If the respondent does not have any living grandchildren in the current wave, special missing (.g) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgkchore indicates whether the current wave's spouse gave help with chores to a grandchild. It is taken from the spouse's **rWgkchore**. In addition to the special missing values used in **rWgkchore**, **sWgkchore** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgrchore indicates whether the respondent gave any help with chores to a parent, parent-in-law, stepparent, sibling, grandparent, or other relative, from outside the household, in the last year. A code of 1 is used if the respondent reports that they provided help with chores to a relative. A code of 0 is used if the respondent reports that they did not provide help with chores to a relative. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgrchore indicates whether the current wave's spouse gave help with chores to a relative. It is taken from the spouse's **rWgrchore**. In addition to the special missing values used in **rWgrchore**, **sWgrchore** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWgfchore indicates whether the respondent gave any help with chores to a friend, colleague, neighbor, clergy, therapist or other professional helper, housekeeper/home health care provider, other acquaintance, or person of unlisted relation type, from outside the household, in the last year. A code of 1 is used if the respondent reports that they provided help with

chores to a non-relative. A code of 0 is used if the respondent reports that they did not provide help with chores to a non-relative. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

swgfchore indicates whether the current wave's spouse gave help with chores to a non-relative. It is taken from the spouse's **rwgfchore**. In addition to the special missing values used in **rwgfchore**, **swgfchore** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The lists of relations used to determine who help was provided to, both for people from outside and inside the household, include spouses, ex-spouses, parents, parents-in-law, stepparents, siblings, children, children-in-law, grandchildren, grandparents, other relatives, friends, colleagues, and neighbors at all waves. At Waves 1, 2, and 5, these lists also include other acquaintances. At Wave 4 and then again starting at Wave 6, these lists also include clergy, therapists or other professional helpers, housekeepers/home health care providers, and relations not in this list. In Wave 4, respondents can also report which member of their social network provided this help, but the relation types for members of their social network are the same as the relation types used to ask about informal care received, so this change is not expected to have an effect on the harmonized variables of Wave 4.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about providing help with chores.

Cross-Study Differences with the HRS

The Harmonized HRS includes **hwgpcchore**, which indicates help with chores care given to parents by the respondent or spouse. The Gateway Harmonized SHARE indicates help with chores given by the respondent only and includes additional variables indicating other relationships that the respondent provides help to which are absent in the Harmonized HRS. Additionally, parents are included in care to relatives in the Gateway Harmonized SHARE.

Unlike SHARE, HRS did not make a distinction between care given from outside the household vs care given from inside the household. As HRS did not have this distinction, the comparable variables in the Harmonized HRS capture care given from both outside and inside the household whereas the care given variables in the Gateway Harmonized SHARE do not capture IADL care given from inside the household as it was not asked about in SHARE.

Looks After Grandchildren

Variable	Waves	Label	Type
rWgksit	1-2, 4-9	rWgksit:WW R looked after grandchildren	Categ
sWgksit	1-2, 4-9	sWgksit:WW S looked after grandchildren	Categ

How Constructed

rWgksit indicates whether the respondent occasionally or regularly looked after their grandchildren without the presence of parents, in the past year. A code of 1 is used if the respondent reports they looked after their grandchildren. A code of 0 is used if the respondent did not look after their grandchildren and the respondent has one or more living grandchildren in the current wave. If the respondent does not have any living grandchildren in the current wave, special missing (.g) is assigned. In Waves 4 through 7, if the respondent was not asked whether they looked after their grandchildren as they were not the family respondent, special missing (.n) is assigned. Those who completed the condensed interview in Wave 7 were not asked these questions and are assigned special missing value (.c). Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Responses are set to blank missing (.) if the respondent did not participate in the current wave.

sWgksit indicates whether the current wave's spouse looked after their grandchildren. It is taken from the spouse's **rWgksit**. In addition to the special missing values used in **rWgksit**, **sWgksit** employs two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In SHARE Waves 1 and 2 and starting again in Wave 8, all respondents who had one or more living grandchildren were asked whether they looked after their grandchildren. In Waves 4 through 7, only the family respondent is asked whether they looked after their grandchildren.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked questions about looking after grandkids.

Cross-Study Differences with the HRS

The Harmonized HRS includes **hWgksit**, indicating either the respondent or spouse watched grandchildren, while the Harmonized HRS includes **rWgksit**, indicating the respondent watched grandchildren.

How Constructed

rWsatjob indicates how much the respondent agrees that they are satisfied with their job all things considered.

rWdemand indicates how much the respondent agrees that their job is physically demanding.

rWdeserve indicates how much the respondent agrees that they receive the recognition they deserve from work.

rWsalary indicates how much the respondent agrees that their salary is adequate considering all their efforts and achievement.

rWpromot indicates how much the respondent agrees that their job promotion prospects are poor.

rWsecure indicates how much the respondent agrees that their job security is poor.

rWtimepre indicates how much the respondent agrees that their job is under constant time pressure due to a heavy workload.

rWlthfree indicates how much the respondent agrees that they have very little freedom to decide how to do work.

rWnskills indicates how much the respondent agrees that they have the opportunity to develop new skills.

rWsupport indicates how much the respondent agrees that they receive adequate support in difficult situations at work.

The variables are coded so that higher scores indicate more stress that the respondent feels about their job. As such, **rWdemand**, **rWpromot**, **rWsecure**, **rWtimepre**, and **rWlthfree** are coded as follows: 1.strongly disagree, 2.disagree, 3.agree, and 4.strongly agree. **rWsatjob**, **rWdeserve**, **rWsalary**, **rWnskills**, and **rWsupport** are coded as follows: 1.strongly agree, 2.agree, 3.disagree, and 4.strongly disagree. Special missing (.w) is assigned if the respondent indicates they are not currently working. Special missing (.w) is also assigned if the respondent answered the question but was not currently working. Starting in Wave 2, special missing (.n) is assigned if the question was not asked because the respondent lives in a nursing home. Special missing (.j) is assigned if the respondent did not change jobs between Waves 4 and 5. Special missing .a is assigned in Wave 5 if the respondent has not worked continuously since their last interview as these questions were only asked to respondents who reported a change in their job at Wave 5. Also starting in Wave 5, this question is no longer asked to new respondents, so a special missing (.b) is assigned to indicate a baseline interview. In Wave 7 respondents who were a part of the SHARELIFE interview, rather than the regular SHARE questionnaire, were not asked job-satisfaction questions. Don't know, refused, or other missing responses are assigned special missing values (.d), (.r), (.m), respectively. Plain missing (.) is assigned for respondents who did not respond to the current wave.

sWsatjob, **sWdemand**, **sWdeserve**, **sWsalary**, **sWpromot**, **sWsecure**, **sWtimepre**, **sWlthfree**, **sWnskills** and **sWsupport** indicate the current wave's spouse's level of agreement with statements about their job and are taken from the spouse's values to **rWsatjob**, **rWdemand**, **rWdeserve**, **rWsalary**, **rWpromot**, **rWsecure**, **rWtimepre**, **rWlthfree**, **rWnskills** and **rWsupport**. In addition to the special missing codes used in **rWsatjob**, **rWdemand**, **rWdeserve**, **rWsalary**, **rWpromot**, **rWsecure**, **rWtimepre**, **rWlthfree**, **rWnskills** and **rWsupport**, **sWsatjob**, **sWdemand**, **sWdeserve**, **sWsalary**, **sWpromot**, **sWsecure**, **sWtimepre**, **sWlthfree**, **sWnskills** and **sWsupport** employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWjobsum indicates the mean of the six different job stress questions (**rWsatjob**, **rWdemand**, **rWsalary**, **rWsecure**, **rWtimepre** and **rWnskills**) and can be used as a summary score. **rWjobsum** is calculated for any respondent with at least one non-missing value for its six components. In Wave 7 respondents who were a part of the SHARELIFE interview, rather than the regular SHARE questionnaire, were not asked job-satisfaction questions. **rWjobsum** counts the number of components with missing values in **rWjobsum**, which could be between no missing components (0) and six missing components (6). If all components are missing, **rWjobsum** is assigned special missing values (.w), (.n), (.j), (.a), (.b), (.d), (.r), or (.m), based on the value of its components. **rWjobsum** and **rWjobsum** are assigned plain missing (.) if the respondent did not participate in the current wave.

sWjobsum and **sWjobsum** indicate the mean summary score of six different job stress questions and the count of any missing components for the current wave's spouse and is taken from the spouse's values to **rWjobsum**. In addition to the special missing codes used in **rWjobsum**, **sWjobsum** employs two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 1, the questions are asked to respondents who did paid work in the last four weeks, were temporarily away from work, or were currently employed or self-employed (including working for a family business). In Waves 2 and 4, the questions are asked to respondents who did paid work in the last four weeks, or who are currently employed or self-employed (including working for a family business). Starting in Wave 2, respondents living in a nursing home are not asked these questions. In

Wave 5, the questions are asked to respondents who were currently employed or self-employed or did paid work in the last four weeks, and those who report a change in their job and have been working since the last interview. Starting in Wave 5, new respondents are not asked these questions regardless of working status. Starting in Wave 6, the questions are asked to respondents who are currently employed or self-employed (including working for a family business). In Wave 7 respondents who were a part of the SHARELIFE interview, rather than the regular SHARE questionnaire, were not asked job-satisfaction questions.

Cross-Study Differences with the HRS

HRS has a larger battery of items that ask about job stress and strain.

Unlike HRS, SHARE's original answer options range from strongly agree to strongly disagree, which have been coded so that higher values indicate higher levels of work stress.

The wording of the item asking about adequacy of salary is also slightly varied between HRS and SHARE. SHARE asks, "Considering all my efforts and achievements, my [salary is/earnings are] adequate. Would you say you strongly agree, agree, disagree or strongly disagree?" HRS asks, "Please say how much you agree or disagree with each of the following statements. My salary is adequate."

How Constructed

These variables indicate whether the respondent experienced a stressful event in their lifetime or in their childhood. SHARE asks some of these questions by explicitly asking whether the stressful event happened before a certain age or by asking the year the event occurred if it had occurred at all during the respondent's lifetime. To derive some of these variables which indicate whether the respondent experienced the event during childhood, the birth year and the year the event was reported to have occurred were used.

ramischlth indicates whether the respondent missed a month or more of school before the age of 16 because of a health condition.

rapadrug indicates whether either of the respondent's parents/guardians drank heavily/had mental health problems during childhood.

Both **ramischlth** and **rapadrug** are created based on questions only asked as part of SHARELIFE. A code of 1 is assigned if the respondent reported the event had happened. A code of 0 is assigned if the respondent reported the event did not happen. The questions about whether either of the respondent's parents/guardians drank heavily/had mental health problems

during the respondent's childhood were not asked in the SHARELIFE Wave 7 questionnaire. Special missing (.a) is assigned if the respondent was not interviewed as part of the Wave 3 SHARELIFE survey. Don't know, refused, or other missing responses to **ramischlth** and **rapadrug** are assigned special missing values (.d), (.r), (.m) respectively.

rWsfneh indicates whether the respondent ever experienced financial hardship. **rasfnhch** indicates whether the respondent experienced financial hardship before age 16. Whether the respondent experienced a financial hardship and the year they experienced it were asked as part of the SHARELIFE survey. The age at which the event occurred is derived using the year the respondent reported financial hardship and the respondent's birth year. **rWsfneh** is assigned a value of 1 if the respondent reported ever experiencing financial hardship, and is assigned a value of 0 if the respondent reported never experiencing financial hardship. **rasfnhch** is assigned a value of 1 if the respondent reported that financial hardship occurred before the respondent was 16, and is assigned a value of 0 if the respondent reported that they never experienced financial hardship or it only occurred when the respondent was 16 or older. Special missing .q is assigned to **r7sfneh** if the respondent was not part of the Wave 7 SHARELIFE survey but was part of the regular Wave 7 survey. Special missing (.a) is assigned to **rasfnhch** if the respondent was not interviewed as part of the SHARELIFE survey. Don't know, refused, or other missing responses to **rWsfneh** and **rasfnhch** are assigned special missing values (.d), (.r), (.m) respectively. **rWsfneh** is assigned plain missing (.) if the respondent did not respond to the current wave.

ralivdiffch indicates whether the respondent experienced a difficult living arrangement before age 16. Questions about difficult accommodation events throughout life and all types of residences the respondent lived in six months or more since birth were asked as part of the SHARELIFE survey. A code of 1 is assigned if the respondent reported that they ever lived in a children's home (no age specified), had been fostered by another family (no age specified), or that they had lived in an orphanage/children's home, housing with the armed forces, mental hospital, other hospital, prisoner of war camp, prison, labor camp or concentration camp for more than six months before the age of 16. A code of 0 is assigned if the respondent reported that they never lived in a children's home and never had been fostered by another family and that they reported they had not lived in an orphanage/children's home, housing with the armed forces, mental hospital, other hospital, prisoner of war camp, prison, labor camp or concentration camp for more than six months before the age of 16. Special missing (.a) is assigned if the respondent was not interviewed as part of the SHARELIFE survey. Don't know, refused, or other missing responses to **ralivdiffch** are assigned special missing values (.d), (.r), (.m) respectively.

sWmischlth, **sWpadrug**, **sWsfneh**, **sWsfnhch**, and **sWlivdiffch** contain the corresponding information for the respondent's current wave's spouse and are taken from the spouse's values to **ramischlth**, **rapadrug**, **rWsfneh**, **rasfnhch**, and **ralivdiffch**. In addition to the special missing codes used in **ramischlth**, **rapadrug**, **rWsfneh**, **rasfnhch**, and **ralivdiffch**, **sWmischlth**, **sWpadrug**, **sWsfneh**, **sWsfnhch**, and **sWlivdiffch** employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

ralsevent_s is the count of how many lifetime stressful events the respondent experienced. The count is based on whether the respondent has missed a month or more of school before the age of 16 because of a health condition (**ramischlth**), whether either of the respondent's parents/guardians drank heavily/had mental health problems during childhood (**rapadrug**), whether the respondent ever experienced financial hardship (**rWsfneh**) and whether the respondent had experienced a difficult living arrangement before age 16 (**ralivdiffch**). **ralsevent_s** is calculated as long as one of the component variables is not missing. Special missing (.m) is assigned if all four components of this count are missing. **ralseventm_s** is the count of missing components in **ralsevent_s**, which could be between no missing components (0) and four missing components (4). Special missing (.a) is assigned to **ralsevent_s** and **ralseventm_s** if the respondent was not interviewed as part of the SHARELIFE survey.

sWlsevent_s and **sWlseventm_s** are the count of lifetime stressful events and the count of missing components for the current wave's spouse and their values are taken from the spouse's values to **ralsevent_s** and **ralseventm_s**. In addition to the special missing codes used in **ralsevent_s** and **ralseventm_s**, **sWlsevent_s** and **sWlseventm_s** employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

racsevent_s is the count of how many stressful events the respondent experienced by the age of 16. The count is based on whether the respondent has missed a month or more of school before age 16 because of a health condition

(**ramischlth**), whether either of the respondent's parents/guardians drank heavily/had mental health problems during childhood (**rapadrug**), whether the respondent experienced financial hardship before age 16 (**rasfnhch**) and whether the respondent had experienced a difficult living arrangement before age 16 (**ralivdiffch**). **racsevent_s** is calculated as long as one of the component variables is not missing. Special missing (.m) is assigned if all four component of this count are missing. **racseventm_s** is the count of missing components in **racsevent_s**, which could be between no missing components (0) and four missing components (4). Special missing (.a) is assigned to **racsevent_s** and **racseventm_s** if the respondent was not interviewed as part of the SHARELIFE survey.

swcsevent_s and **swcseventm_s** are the count of childhood stressful events and the count of missing components for the current wave's spouse and their values are taken from **racsevent_s** and **racseventm_s**. In addition to the special missing codes used in **racsevent_s** and **racseventm_s**, **swcsevent_s** and **swcseventm_s** employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Questions related to childhood and lifetime events are only asked in the SHARELIFE surveys, which happened during SHARE Wave 3 and SHARE Wave 7.

Questions about whether either of the respondent's parents/guardians drank heavily/had mental health problems during the respondent's childhood were not asked in the SHARELIFE Wave 7 questionnaire.

If respondents were asked about ever experiencing financial hardship in SHARELIFE Wave 3, they were not asked in SHARELIFE Wave 7.

Cross-Study Differences with the HRS

HRS asks the respondent to rate their financial situation while growing up, whereas SHARE asks the respondent whether the respondent ever experienced financial hardship.

HRS asks respondents whether their parents drink or use drugs so often that it caused problems in the family, in a single question. SHARE asks respondents about whether their parents or guardians smoke, drink heavily, have mental health problems, or did none of these, where the respondent could select all that apply. HRS also asks the respondents whether the behavior happened "so often that it caused problems in the family", whereas SHARE's respondents are asked if during their childhood, their parents smoked, drunk heavily or had mental health problems, without reference to whether it caused problems. Reports of parents/guardians smoking are not considered in the derivation of **rapadrug** for the Gateway Harmonized SHARE.

How Constructed

rWleftoutt indicates how often the respondent feels left out of things (taken from a perceptions of aging section). **rWleftoutt** is coded as follows: 1.hardly ever or never, 2.some of the time and 3.often. Originally this variable had a four-point scale that we turned into a three-point scale by combining "rarely" and "never" into "hardly ever or never" for comparability to the other variables. Special missing (.f) is assigned if the respondent did not complete the self-completion questionnaire in Wave 1. Don't know, refused, or missing responses are assigned special missing values (.d), (.r), (.m), respectively. Plain missing (.) is assigned for respondents who did not respond to the current wave.

sWleftoutt indicates how often the current wave's spouse feels left out of things (taken from a perceptions of aging measure). It is taken from the spouse's values to **rWleftoutt**. In addition to the special missing codes employed by **rWleftoutt**, **sWleftoutt** employs two additional missing codes, (.u) and (.v). If the respondent is not designated as coupled in the current wave and assumed to be single a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married a special missing value of (.v) is used. **sWleftoutt** is set to plain missing (.) for respondents who did not respond to the current wave.

rWcomplac indicates how much time the respondent feels they lack companionship.

rWleftout indicates how much time the respondent feels left out.

rWisolate indicates how much time the respondent feels isolated from others.

rWcomplac, **rWleftout** and **rWisolate** are asked starting at Wave 4 and are coded as follows: 1.hardly ever or never, 2.some of the time and 3.often. Special missing (.f) is assigned at Wave 4 if the respondent did not complete the self-completion questionnaire, where these questions were asked in that wave. In Wave 7, if the respondent did not complete the regular SHARE questionnaire, where these questions were asked, but rather completed the SHARELIFE Wave 7 questionnaire, they would not have been asked the above questions about lack of companionship, feeling left out, and feeling isolated. Don't know, refused, or other missing responses are assigned special missing values (.d), (.r), (.m), respectively. Plain missing (.) is assigned for respondents who did not respond to the current wave.

sWcomplac, **sWleftout** and **sWisolate** indicate how much time the current wave's spouse feels a lack of companionship, feels left out, or feels isolated from others, respectively. They are taken from the spouse's values to **rWcomplac**, **rWleftout** and **rWisolate**. In addition to the special missing codes employed by **rWcomplac**, **rWleftout** and **rWisolate**, **sWcomplac**, **sWleftout** and **sWisolate** employ two additional missing codes, (.u) and (.v). If the

respondent is not designated as coupled in the current wave and assumed to be single a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married a special missing value of (.v) is used. **sWcomplac**, **sWleftout** and **sWisolate** are set to plain missing (.) for respondents who did not respond to the current wave.

rWlnlys3 is the mean loneliness score of three items: **rWcomplac**, **rWleftout** and **rWisolate**. **rWlnlys** is calculated for any respondent with at least one non-missing value for its three components. Special missing (.f) is assigned at Wave 4 if the respondent did not complete the self-completion questionnaire where these questions were asked during that wave. In Wave 7, if the respondent did not complete the regular SHARE questionnaire, where these questions were asked, but rather completed the SHARELIFE Wave 7 questionnaire, they would not have been asked the above questions about lack of companionship, feeling left out, and feeling isolated. **rWlnlys3m** counts the number of components with missing values in **rWlnlys3**, which could be between no missing components (0) and three missing components (3). **rWlnlys3** and **rWlnlys3m** are available starting at Wave 4. **rWlnlys3** is assigned special missing (.f), (.d), (.r) or (.m) if all component variables have missing values, depending on the special missing values used in the component variables. Plain missing (.) is assigned if the respondent did not participate in the current wave.

sWlnlys3 and **sWlnlys3m** indicate the mean summary score of three different loneliness questions and the count of any missing components for the current wave's spouse and are taken from the spouse's value to **rWlnlys3** and **rWlnlys3m**. In addition to the special missing codes used in **rWlnlys3** and **rWlnlys3m**, **sWlnlys3** and **sWlnlys3m** employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

How often the respondent feels left out was asked in the self-completion questionnaire of Wave 1; however, starting in Wave 2 the question was moved to the core questionnaire.

How much time the respondent feels a lack of companionship, left out, and isolated from others were asked in the self-completion questionnaire in Wave 4. The questions were moved to the core questionnaire from Wave 5 onward. In Wave 7, if the respondent did not complete the regular SHARE questionnaire, where these questions were asked, but rather completed the SHARELIFE Wave 7 questionnaire, they would not have been asked the above questions about lack of companionship, feeling left out, and feeling isolated.

Cross-Study Differences with the HRS

How often the respondent feels in tune with the people around them is not asked in SHARE as it is in HRS.

Unlike HRS where the answer options range from 1.often to 3.hardly ever or never, we have recoded SHARE's answer options to range from 1.hardly ever to 3.often so that higher scores indicate more stress.

Continuous Variable Distributions

Variable	N	Mean	Std.Dev	Minimum	Maximum	Total missing

N. Housing

House Type

Variable	Waves	Label	Type
hhWhousetyp_s	1-2, 4-9	hhWhousetyp_s:WW type of building	Categ

How Constructed

hhWhousetyp_s indicates what type of building the household lives in. hhWhousetyp_s is coded as follows: 1.Farm house, 2.A free standing one or two family house, 3.A one or two family house as row or double house, 4.A building with 3 to 8 flats, 5.A building with 9 or more flats but no more than 8 floors, 6.A high-rise with 9 or more floors, 7.A housing complex with services for elderly, 8.Special housing for elderly or nursing home (24 hours attention). This question is asked of the respondent only if the interview takes place outside of the respondent's residence. The interviewer reports this information if the interview takes place in the respondent's residence. It is assigned a code of 8 if these questions are not asked because the respondent resides in a nursing home. If a returning respondent reports that they did not change residences since the previous wave, their report from the previous wave is carried forward. Don't know, refused, or other missing responses of hhWhousetyp_s are assigned special missing codes (.d), (.r), (.m), respectively. hhWhousetyp_s is set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

Starting in Wave 2, this question is skipped if a returning respondent reports that they did not change residences since the previous wave.

Cross-Study Differences with the HRS

In HRS there are different possible categories of home type and they are as follows: 1.mobile home, 2.one family house, 3.two family home/duplex, 4.apartment/townhouse/condo, 5.senior/ retirement community, 6.nursing home, 7.other. Whereas in SHARE the categories are as follows: 1.Farm house, 2.A free standing one or two family house, 3.A one or two family house as row or double house, 4.A building with 3 to 8 flats, 5.A building with 9 or more flats but no more than 8 floors, 6.A high-rise with 9 or more floors, 7.A housing complex with services for elderly, 8.Special housing for elderly or nursing home (24 hours attention).

Lets or Sublets

Variable	Waves	Label	Type
hhWhsletrm	1-2, 4-9	hhWhsletrm:ww whether HH lets or sublets part of accommodation	Categ

How Constructed

hhWhsletrm indicates whether the respondent sublets or lets part of their accommodation. **hhWhsletrm** is coded as 0 if there are no sublets or lets. **hhWhsletrm** is coded as 1 if there is a sublet or let. If the respondent reports that they live rent free, a special missing value (.s) is assigned because the question is not asked. Starting in Wave 2, nursing home respondents are not asked this question, and are assigned special missing value (.n). If a returning respondent reports that they did not change residences since the previous wave, their report from the previous wave is carried forward. Don't know, refused, or other missing responses of **hhWhsletrm** are assigned special missing codes (.d), (.r), (.m), respectively. **hhWhsletrm** is set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

Starting in Wave 2, this question is skipped if a returning respondent reports that they did not change residences since the previous wave.

Cross-Study Differences with the HRS

No differences known.

Number of Rooms

Variable	Waves	Label	Type
hhWnumrma	1-2, 4-9	hhWnumrma:ww HH number of rooms (not incl. kitchen, baths, hallways)	Cont

How Constructed

hhWnumrma indicates the number of rooms there are in the house, not including kitchens, bathrooms, and hallways. If a returning respondent reports that they did not change residences since the previous wave, their report from the previous wave is carried forward. Starting in Wave 2, nursing home respondents are not asked this question, and are assigned special missing value (.n). Don't know, refused, or other missing responses of **hhWnumrma** are assigned special missing codes (.d), (.r), (.m), respectively. **hhWnumrma** is set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

Starting in Wave 2, this question is skipped if a returning respondent reports that they did not change residences since the previous wave.

Cross-Study Differences with the HRS

The HRS asks for the number of rooms in the respondent's home, not counting bathrooms, hallways, or unfinished basements, whereas SHARE asks the respondent to exclude kitchens, bathrooms, and hallways.

Number of Floors

Variable	Waves	Label	Type
hhWnumflr	1-2, 4-5	hhWnumflr:ww number of floors in building	Categ

How Constructed

hhWnumflr indicates how many floors there are in the building the household lives in, including the ground floor. **hhWnumflr** is coded as follows: 1.One story, 2.Two stories, 3.More than two stories. This question is only asked for respondents living in a building with 3 to 8 flats or a building with 9 or more flats but no more than 8 floors. Respondents living in a high-rise with 9 or more floors are assigned a code of 3. This question is asked of the respondent only if the interview takes place outside of the respondent's residence. The interviewer reports this information if the interview takes place in the respondent's residence. This question is skipped and special missing value (.s) is assigned if the respondent lives in a farm house, a free standing one or two family house, a one or two family house as a row or double house, a housing complex with services for the elderly, or in special housing for the elderly (24 hours attention). Starting in Wave 2, nursing home respondents are not asked this question, and are assigned special missing value (.n). Don't know, refused, or other missing responses of **hhWnumflr** are assigned special missing codes (.d), (.r), (.m), respectively. **hhWnumflr** is set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

This question is only asked in Waves 1, 2, 4, and 5.

Cross-Study Differences with the HRS

No differences known.

Steps to Enter House

Variable	Waves	Label	Type
hhWstepentr	1-2, 4-9	hhWstepentr:ww number of steps to enter house	Categ

How Constructed

hhWstepentr indicates how many steps have to be climbed (up or down) to get to the main entrance of the respondent's flat, not including stairs that are avoided because the block has an elevator. **hhWstepentr** is coded as follows: 1.Up to 5 steps, 2. 6-15 steps, 3. 16+ steps. This question is asked of the respondent only if the interview takes place outside of the respondent's residence. The interviewer reports this information if the interview takes place in the respondent's residence. In Waves 1, 2, 4, and 5, special missing value (.s) is assigned if this question is skipped because the respondent lives in a farm house, a free standing one or two family house, or a one or two family house as row or double house. Starting in Wave 2, nursing home respondents are not asked this question, and are assigned special missing value (.n). If a returning respondent reports that they did not change residences since the previous wave, their report from the previous wave is carried forward. Don't know, refused, or other missing responses of **hhWstepentr** are assigned special missing codes (.d), (.r), (.m), respectively. **hhWstepentr** is set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

In Waves 1, 2, 4, and 5, this question is skipped if the respondent lives in a farm house, a free standing one or two family house, or a one or two family house as row or double house. In Waves 6-9 this question is asked regardless of house type.

Starting in Wave 2, this question is skipped if a returning respondent reports that they did not change residences since the previous wave.

Cross-Study Differences with the HRS

This variable is not available in the RAND HRS or Harmonized HRS because this question is not asked in the HRS.

Elevator

Variable	Waves	Label	Type
hhWhselvtr	1-2, 4-9	hhWhselvtr:ww whether HH has an elevator	Categ

How Constructed

hhWhselvtr indicates whether the respondent's residence has an elevator. **hhWhselvtr** is coded as 0 if there is no elevator. **hhWhselvtr** is coded as 1 if there is an elevator. In Wave 1, this question is asked in the dropoff questionnaire, so those who did not complete the dropoff questionnaire are assigned special missing value (.c). Starting in Wave 2, it is asked in the main questionnaire. If the respondent reports that they did not change residences since the previous wave, their report from the previous wave is carried forward (even if no response was available from Wave 1). Starting in Wave 2, nursing home respondents are not asked this question, and are assigned special missing value (.n). Don't know, refused, or other missing responses of **hhWhselvtr** are assigned special missing codes (.d), (.r), (.m), respectively. **hhWhselvtr** is set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

In Wave 1, this question is asked in the dropoff questionnaire. Starting in Wave 2, it is asked in the main questionnaire.

Starting in Wave 2, this question is skipped if a returning respondent reports that they did not change residences since the previous wave.

Cross-Study Differences with the HRS

No differences known.

Mobility Modifications

Variable	Waves	Label	Type
hhWmobmod	1-2, 4-9	hhWmobmod:WW whether HH has any special features for physical impairments	Categ

How Constructed

hhWmobmod indicates whether the household has any special features that assist persons who have physical impairments or health problems, such as widened doorways, ramps, automatic doors, chair lifts, alerting devices, or kitchen or bathroom modifications. **hhWmobmod** is coded as 0 if there are no modifications. **hhWmobmod** is coded as 1 if there are modifications. If a returning respondent reports that they did not change residences since the previous wave, their report from the previous wave is carried forward. Starting in Wave 2, nursing home respondents are not asked this question, and are assigned special missing value (.n). Don't know, refused, or other missing responses of **hhWmobmod** are assigned special missing codes (.d), (.r), (.m), respectively. **hhWmobmod** is set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

In Waves 1 to 5, this question is asked as a yes or no question. In Waves 6 to 9, the respondent is asked whether their home has specific modifications and **hhWmobmod** is coded as 1 if they answered yes to having any of the individual modifications.

Cross-Study Differences with the HRS

The HRS asks whether the respondent's house has features such as a ramp, railings, or modifications for a wheelchair, and whether they have modified their house to make it easier or safer for an older person or someone with a disability to live there. As such, a somewhat comparable variable to **hhWmobmod** can be created for the HRS.

O. End of Life Planning

Life Insurance: Covered by Life Insurance

Variable	Waves	Label	Type
hWlifein	1-2, 4-9	hWlifein:WW covered by life insurance	Categ

How Constructed

hWlifein indicates whether the respondent and their spouse have any life insurance. It is asked at the couple-level of the Financial Respondent.

In Wave 1, life insurance is included as one of the savings and investment options that the financial respondent is asked about: “Do you or your spouse have any of the following savings and investments?”

- Bank accounts, transaction accounts or saving accounts
- Government or corporate bonds
- Stocks or shares
- Mutual funds or managed investment accounts
- Individual retirements account
- Contractual saving for housing
- Life Insurance

Starting in Wave 2, the financial respondent is asked a separate question: “Do you or your spouse currently own any life insurance policies?” **hWlifein** is assigned a value of 0 if the financial respondent indicates that neither they nor their spouse have any life insurance, and is assigned a value of 1 if the financial respondent indicates that either they or their spouse have any life insurance. In Wave 1 if each spouse is a financial respondent, then **hWlifein** is assigned a value of 0 if neither has any life insurance, and is assigned a value of 1 if at least one reports having life insurance.

In Wave 7, only respondents who were in the Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked these questions. Those that weren't asked are assigned special missing value (.c) in Wave 7. Don't know, refuse, and other missing responses to **hWlifein** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

Cross Wave Differences in SHARE

In Wave 1, life insurance is included as one of the savings and investment options that the financial respondent is asked about.

Starting in Wave 2, life insurance is asked as a separate question.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview) were asked this question.

Cross-Study Differences with the HRS

In HRS, this question is answered by respondents and spouses. In SHARE, this question is answered by the Financial Respondent at the couple-level.

Life Insurance: Term Life Insurance

Variable	Waves	Label	Type
hWtlifein	1-2, 4-9	hWtlifein:WW has term life insurance	Categ
hWtliprm	1-2	hWtliprm:WW term life insurance monthly premium	Cont

How Constructed

hWtlifein indicates whether the respondent and/or their spouse have any term life insurance. It is asked at the couple-level of the Financial Respondent. If the Financial Respondent reports having life insurance, they are then asked whether their life insurance policies are term policies, whole life policies, or both of these. **hWtlifein** is coded as 0 if the Financial Respondent reports they and/or their spouse have no life insurance, or have only whole life policies. **hWtlifein** is coded as 1 if the Financial Respondent reports they and/or their spouse have term policies or both types of policies. **hWtlifein** is assigned special missing (.o) if the Financial Respondent reports having other kinds of policies.

In Wave 7, only respondents who were in the Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked these questions. Those that weren't asked are assigned special missing value (.c) in Wave 7. Don't know, refuse, and other missing responses to **hWtlifein** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

hWtliprm indicates the monthly premium costs of the respondent's and/or their spouse's term life insurance in nominal Euros. If the Financial Respondent reports they and/or their spouse have any term life insurance, they are asked how much they paid on their term policies in the previous year. The value reported here is divided by 12 to obtain a monthly premium value. If the Financial Respondent reports they and/or their spouse have no life insurance or only whole life insurance, then **hWtliprm** is assigned a value of 0. **hWtliprm** is assigned special missing (.o) if the Financial Respondent reports they and/or their spouse have other kinds of policies when asked about the type of policies. **hWtliprm** is only available in Waves 1 and 2 because this question is no longer asked starting in Wave 4. Don't know, refuse, and other missing responses to **hWtliprm** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

Please note the presence of several extremely high values for **hWtliprm**. We leave the decision to include these values to the user.

Cross Wave Differences in SHARE

In Wave 1, the respondent is specifically asked how much they paid on their term policies in 2003. In Wave 2, the respondent is asked how much they paid on their term policies in the previous year. Starting in Wave 4, the respondent is no longer asked how much was paid on their term policies.

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview) were asked about types of life insurance policies.

Cross-Study Differences with the HRS

In HRS, questions about life insurance are answered by respondents and spouses. In SHARE, questions about life insurance are answered by the Financial Respondent at the couple-level.

In HRS, the respondent is asked whether their life insurance policies are whole life policies, but not specifically asked whether they have term policies, and the respondent can report the premium for their term policies in monthly or annual amounts. In SHARE, the respondent is asked whether their life insurance policies are term or whole life policies, and is asked about the cost of their term policies for the previous year. In both surveys, the cost of the term policies is no longer asked about after the first few waves.

Continuous Variable Distributions

Life Insurance: Whole Life Insurance

Variable	Waves	Label	Type
hWwlifein	1-2, 4-9	hWwlifein:WW has whole life insurance	Categ
hWwlifeinv	1-2, 4-9	hWwlifeinv:WW value whole life insurance	Cont

How Constructed

hWwlifein indicates whether the respondent and/or their spouse have any whole life insurance. It is asked at the couple-level of the Financial Respondent. If the Financial Respondent reports they and/or their spouse have life insurance, they are then asked whether their life insurance policies are term policies, whole life policies, or both of these. **hWwlifein** is coded as 0 if the Financial Respondent reports they and/or their spouse have no life insurance, or have only term policies. **hWwlifein** is coded as 1 if the Financial Respondent reports they and/or their spouse have whole life policies or both types of policies. **hWwlifein** is assigned special missing (.o) if the Financial Respondent reports they and/or their spouse have other kinds of policies.

In Wave 7, only respondents who were in the Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked these questions. Those that weren't asked are assigned special missing value (.c) in Wave 7. Don't know, refuse, and other missing responses to **hWwlifein** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

hWwlifeinv indicates the face value of the respondent's and/or their spouse's whole life insurance in nominal Euros. If the Financial Respondent reports they and/or their spouse have any whole life insurance, they are asked the face value of their whole life policies. If the Financial Respondent reports they and/or their spouse have no life insurance or only term life insurance, then **hWwlifeinv** is assigned a value of 0. **hWwlifeinv** is assigned special missing (.o) if the Financial Respondent reports they and/or their spouse have other kinds of policies when asked about the type of policies. **hWwlifeinv** is assigned special missing (.i) if the value reported is a series of 5 or more nines, and is suspected to be an incomplete don't know or refused value.

In Wave 7, only respondents who were in the Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked these questions. Those that weren't asked are assigned special missing value (.c) in Wave 7. Don't know, refuse, and other missing responses to **hWwlifeinv** are set to special missing (.d), (.r), and (.m), respectively. Responses are set to blank missing (.) when the respondent does not participate in the current wave.

Please note the presence of several extremely high values for **hWwlifeinv**. We leave the decision to include these values to the user.

Cross Wave Differences in SHARE

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview) were asked about types of life insurance policies.

Please note that while the questionnaire appears to collect information on the premium amounts for whole life insurance policies, no values are released in the SHARE datasets.

Cross-Study Differences with the HRS

In HRS, questions about life insurance are answered by respondents and spouses. In SHARE, questions about life insurance are answered by the Financial Respondent at the couple-level.

How Constructed

raccrooms indicates the number of rooms the respondent's household occupied, including bedrooms but excluding kitchen, bathrooms and hallways, when the respondent was age 10. This question was asked during Waves 3, 5, and 7. **raccrooms** takes the first reported value. In Wave 5, **raccrooms** is based on SHARE derived variables which include imputations for missing values. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **raccfrooms** is the imputation flag indicating whether the value of **raccrooms** was imputed or not. A code of 1 indicates the value of **raccrooms** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **raccrooms** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed.

sWccrooms is the number of rooms the respondent's current wave's spouse's household occupied when the respondent's spouse was age 10 and is taken directly from the spouse's value for **raccrooms**. **sWccfrooms** indicates whether the value of **sWccrooms** was imputed or not and is based on the respondent's spouse's value for **raccfrooms**. **sWccrooms** and **sWccfrooms** employ the special missing value (.u), when the respondent reports not being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

raccnpeople indicates the number of people living in the respondent's household when the respondent was age 10, including the respondent. This question was asked during Waves 3, 5, and 7. **raccnpeople** takes the first reported value. In Wave 5, **raccnpeople** is based on SHARE derived variables which include imputations for missing values. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **raccfnpeople** is the imputation flag indicating whether the value of **raccnpeople** was imputed or not. A code of 1 indicates the value of **raccnpeople** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **raccnpeople** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed.

sWccnpeople is the number of people living in the respondent's current wave's spouse's household when the respondent's spouse was age 10 and is taken directly from the spouse's value for **raccnpeople**. **sWccfnpeople** indicates whether the value of **sWccnpeople** was imputed or not and is based on the respondent's spouse's value for **raccfnpeople**. **sWccnpeople** and **sWccfnpeople** employ the special missing value (.u), when the respondent reports not being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

raccbath, **racwaterc**, **racwaterh**, **racctoilet**, and **raccheating** are variables indicating whether the respondent's accommodation had specific features when the respondent was age 10. These questions were asked during Waves 3 and 7. **raccbath** indicates whether the respondent's accommodation had a fixed bath when the respondent was age 10. **racwaterc** indicates whether the respondent's accommodation had a cold running water supply when the respondent was age 10. **racwaterh** indicates whether the respondent's accommodation had a hot running water supply when the respondent was age 10. **racctoilet** indicates whether the respondent's accommodation had an inside toilet when the respondent was age 10. **raccheating** indicates whether the respondent's accommodation had central heating when the respondent was age 10. **raccbath**, **racwaterc**, **racwaterh**, **racctoilet**, and **raccheating** are assigned a code of 1 if the respondent reported their accommodation had the specific feature when they were age 10, and is assigned a 0 if the respondent reported not having the specific feature. These variables take the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked these questions. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

sWccbath, **sWccwaterc**, **sWccwaterh**, **sWccctoilet**, and **sWcccheating** contain the corresponding information for the respondent's current wave's spouse and are taken from the spouse's values to **raccbath**, **racwaterc**, **racwaterh**, **racctoilet**, and **raccheating**. In addition to the special missing codes used in **raccbath**, **racwaterc**, **racwaterh**, **racctoilet**, and **raccheating**, **sWccbath**, **sWccwaterc**, **sWccwaterh**, **sWccctoilet**, and **sWcccheating** employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

raccbbooks indicates the number of books in the respondent's accommodation when the respondent was age 10. This question was asked during Waves 3, 5, and 7. A code of 1 indicates that the respondent's accommodation had none or very few books (0-10 books). A code of 2 indicates that the respondent's accommodation had enough books to fill one shelf (11-25 books). A code of 3 indicates that the respondent's accommodation had enough books to fill one bookcase (26-100 books). A code of 4 indicates that the respondent's accommodation had enough books to fill two bookcases (101-200 books). A code of 5 indicates that the respondent's accommodation had enough books to fill more than two bookcases (more than 200 books). **raccbbooks** takes the first reported value. In Wave 5, **raccbbooks** is based on SHARE derived variables which include imputations for missing values. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **raccfbooks** is the imputation flag indicating whether the value of **raccbbooks** was imputed or not. A code of 1 indicates the value of **raccbbooks** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **raccbbooks** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed.

sWccbooks is the number of books in the respondent's current wave's spouse's accommodation when the respondent's spouse was age 10 and is taken directly from the spouse's value for **raccbbooks**. **sWccfbooks** indicates whether the value of **sWccbooks** was imputed or not and is based on the respondent's spouse's value for **raccfbooks**. **sWccbooks** and **sWccfbooks** employ the special missing value (.u), when the respondent reports not being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

raccmathperf indicates the relative performance of the respondent to others mathematically in school when the respondent was age 10. This question was asked during Waves 3, 5, and 7. A code of 1 indicates that the respondent was much better mathematically than average. A code of 2 indicates that the respondent was better mathematically than average. A code of 3 indicates that the respondent was about the same mathematically as average. A code of 4 indicates that the respondent was worse mathematically than average. A code of 5 indicates that the respondent was much worse mathematically than average. **raccmathperf** takes the first reported value. In Wave 5, **raccmathperf** is based on SHARE derived variables which include imputations for missing values. In Wave 5, **raccmathperf** is assigned special missing (.i) if the value is missing because the respondent was in an institution at the time of the interview and SHARE did not ask this question to respondents living in institutions. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.q) is assigned if the respondent did not go to school. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **raccfmathperf** is the imputation flag indicating whether the value of **raccmathperf** was imputed or not. A code of 1 indicates the value of **raccmathperf** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **raccmathperf** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed. SHARE does not provide imputations of HO module variables for institutionalized respondents.

sWccmathperf is the relative performance of the respondent's current wave's spouse to others mathematically in school when the respondent's spouse was age 10 and is taken directly from the spouse's value for **raccmathperf**. **sWccfmathperf** indicates whether the value of **sWccmathperf** was imputed or not and is based on the respondent's spouse's value for **raccfmathperf**. **sWccmathperf** and **sWccfmathperf** employ the special missing value (.u), when the respondent reports not being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

racclangperf indicates the relative performance of the respondent to others in the country's language in school when the respondent was age 10. This question was asked during Waves 3, 5, and 7. A code of 1 indicates that the respondent was much better in the country's language than average. A code of 2 indicates that the respondent was better in the country's language than average. A code of 3 indicates that the respondent was about the same in the country's language as average. A code of 4 indicates that the respondent was worse in the country's language than average. A code of 5 indicates that the respondent was much worse in the country's language than average. **racclangperf** takes the first reported value. In Wave 5, **racclangperf** is based on SHARE derived variables which include imputations for missing values. In Wave 5, **racclangperf** is assigned special missing (.i) if the value is missing because the respondent was in an institution at the time of the interview and SHARE did not ask this question to respondents living in institutions. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.q) is assigned if the

respondent did not go to school. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **racclangperf** is the imputation flag indicating whether the value of **racclangperf** was imputed or not. A code of 1 indicates the value of **racclangperf** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **racclangperf** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed. SHARE does not provide imputations of HO module variables for institutionalized respondents.

swccclangperf is the relative performance of the respondent's current wave's spouse to others in the country's language in school when the respondent's spouse was age 10 and is taken directly from the spouse's value for **racclangperf**. **swccclangperf** indicates whether the value of **swccclangperf** was imputed or not and is based on the respondent's spouse's value for **racclangperf**. **swccclangperf** and **swccclangperf** employ the special missing value (.u), when the respondent reports not being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

The number of rooms, the number of people, and number of books in the respondent's accommodation when the respondent was age 10 were only asked at Waves 3, 5, and 7. Relative educational performance in mathematics and language was only asked at Waves 3, 5, and 7. In Wave 5, SHARE provides imputed values for all five questions and these imputed values are incorporated into **raccrooms**, **raccnpeople**, **raccbooks**, **raccmathperf**, and **racclangperf**.

Questions about the features of the respondent's accommodations at age 10 are only asked as part of Waves 3 and 7.

Cross-Study Differences with the HRS

Unlike HRS, SHARE asked the number of rooms the respondent's household occupied (including bedrooms but excluding kitchen, bathrooms, and hallways) when the respondent was age 10 and not the number of bedrooms in the respondent's household when the respondent was age 10.

HRS does not include questions about the features of the respondent's accommodation when the respondent was age 10.

Continuous Variable Distributions

How Constructed

In order to provide a harmonized measure of education across all countries included in SHARE, the survey categorized education achievements using the 1997 International Standard Classification of Education ISCED-97 codes. Respondents were asked to report their parents' highest school degree or vocational training according to their country's educational system. SHARE then asked educational experts in each country to map local educational achievements to ISCED codes. For more information on ISCED codes see <http://uis.unesco.org/> and the OECD document entitled "Classifying Educational Programmed: Manual for ISCED-97 Implementation in OECD Countries, 1999 Edition".

ramomedisc and **radadedisc** indicate the level of education completed by the respondent's mother and father, respectively, according to ISCED codes. This question was asked during Waves 5, 6, 8, and 9. **ramomedisc** and **radadedisc** are coded as follows: 0.None, 1.Primary education, 2.Lower secondary education, 3.upper secondary education, 4.Post-secondary non-tertiary education, 5.First stage of tertiary education, 6.Second stage of tertiary education. **ramomedisc** and **radadedisc** take the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.o) is assigned if the respondent said that their mother or father obtained "other" education than the listed options. A special missing of (.s) is assigned if the mother or father is still in school. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

sWmomedisc and **sWdadadisc** indicate the current wave's spouse's mother's and father's education according to ISCED codes, respectively, and are taken from the spouse's values to **ramomedisc** and **radadedisc**. In addition to the special missing codes used in **ramomedisc** and **radadedisc**, **sWmomedisc** and **sWdadadisc** employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

ramomeducel and **radadeducel** identify the level of education completed by the respondent's mother and father, respectively, according to a five-tier harmonized scale which we developed to compare education levels across countries. This Harmonized education scale is a simplified version of 1997 International Standard Classification of Education

(ISCED-97) codes. For more information on ISCED codes, see www.uis.unesco.org and the OECD document entitled "Classifying Educational Programmes: Manual for ISCED-97 Implementation in OECD Countries, 1999 Edition". **ramomeducl** and **radadeducl** are coded as follows: 1.Less than primary education, 2.Primary education, 3.Lower secondary education, 4.Upper secondary & vocational training, and 5.Tertiary education. Less than primary education is equivalent to no education. Upper secondary and vocational training is equivalent to upper secondary and post-secondary non-tertiary education. Tertiary education is equivalent to the first and second stage of tertiary education. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.o) is assigned if the respondent said that their mother or father obtained "other" education than the listed options. Special missing of (.s) is assigned if the mother or father is still in school. Don't know, refused, or otherwise missing responses are assigned special missing values (.d), (.r), (.m), respectively.

sWmomeducl and **sWdadeducl** indicate the current spouse's mother's and father's five-tier harmonized category of education in each wave, respectively, and are taken from the spouse's values to **ramomeducl** and **radadeducl**. In addition to the special missing codes used in **ramomeducl** and **radadeducl**, **sWmomeducl** and **sWdadeducl** employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

ramomeducl and **radadeducl** indicate the level of education completed by the respondent's mother and father, respectively, according to a three-tier harmonized scale which we developed to compare education levels across countries. This Harmonized education scale is a simplified version of 1997 International Standard Classification of Education (ISCED-97) codes. This question was asked during Waves 5, 6, 8, and 9. **ramomeducl** and **radadeducl** are coded as follows: 1.Less than upper secondary education, 2.upper secondary & vocational training, and 3.Tertiary education. Respondents are assigned a code of 1 if the respondent has an educational level equivalent to a code of 0, 1, or 2 for the ISCED-97. Respondents are assigned a code of 2 if the respondent has an educational level equivalent to a code of 3 or 4 for the ISCED-97. Respondents are assigned a code of 3 if the respondent has an educational level equivalent to a code of 5 or 6 for the ISCED-97. **ramomeducl** and **radadeducl** take the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.o) is assigned if the respondent said that their mother or father obtained "other" education than the listed options. Special missing of (.s) is assigned if the mother or father is still in school. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

sWmomeducl and **sWdadeducl** indicate the current spouse's mother's and father's three-tier harmonized category of education in each wave, and the values are taken from **ramomeducl** and **radadeducl**. In addition to the special missing codes employed by **ramomeducl** and **radadeducl**, **sWmomeducl** and **sWdadeducl** employ two additional special missing codes, (.u) and (.v). If the respondent is not designated as coupled in the current wave and assumed to be single, a special missing value of (.u) is used. If the respondent is not designated as coupled in the current wave but reports being married, a special missing value of (.v) is used.

ramaoccup_s is the 1988 International Standard Classification of Occupations (ISCO-88) major group code for the occupation of the respondent's household's main breadwinner when the respondent was age 10. This question was asked during Waves 3 and 7. In Wave 3, respondents were asked to identify the occupation of the respondent's household's main breadwinner when the respondent was age 10 by selecting from a list of 10 ISCO titles. A code of 11 indicates that the respondent's household had no main breadwinner. For more information about the ISCO-88 Codes used in Wave 3 see <http://www.ilo.org/public/english/bureau/stat/isco/isco88/index.htm>. In Wave 7, respondents are asked to describe the occupation of the respondent's household's main breadwinner when the respondent was age 10. SHARE then used the current ISCO-88 to classify and aggregate occupational information. These ISCO-88 codes were then reclassified into the same major group codes asked in the Wave 3 question. **ramaoccup_s** takes the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.c) is assigned if the occupation code has not been coded by SHARE yet. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

sWmaoccup_s contains the corresponding information for the respondent's current wave's spouse and are taken from the spouse's value to **ramaoccup_s**. In addition to the special missing codes used in **ramaoccup_s**, **sWmaoccup_s** employs two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

ramomoccup and **radadoccup** indicate the respondent's mother's and father's occupation, respectively, when the respondent was age 10. This question was asked during Wave 6. A code of 1 is assigned if the occupation is categorized as white collar, which includes legislator, senior official, manager, professional, technician or associate professional. A code of 2 is assigned if the occupation is categorized as blue collar, which includes clerk, service, shop or market sales worker, skilled agricultural or fishery worker, craft or related trades worker, plant/machine operator, assembler or elementary occupation. A code of 4 is assigned if the occupation was categorized as other. **ramomoccup** and **radadoccup** take the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.h) is assigned if the respondent's mother or father was a homemaker when the respondent was age 10. A special missing (.l) is assigned if the respondent was part of the longitudinal questionnaire in Wave 6 and was not asked this question. A special missing (.n) is assigned if the respondent's mother or father was unemployed when the respondent was age 10. A special missing (.s) is assigned if the respondent's mother or father was permanently sick or disabled when the respondent was age 10. A special missing (.w) is assigned if the respondent's mother or father was retired when the respondent was age 10. Don't know, refused, or other missing responses are assigned special missing values (.d), (.r) or (.m), respectively.

sWmomoccup and **sWdadoccup** indicate the current wave's spouse's mother's and father's occupation when the spouse was age 10 and are taken from the spouse's values to **ramomoccup** and **radadoccup**. In addition to the special missing codes used in **ramomoccup** and **radadoccup**, **sWmomoccup** and **sWdadoccup** employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Questions about parental education were only asked during Waves 5, 6, 8, and 9 of SHARE.

The occupation of main breadwinner when the respondent was age 10 is only asked as part of Waves 3 and 7. In Wave 3, SHARE surveys the occupation of the respondent's household's main breadwinner when the respondent was age 10 using showcards where the respondent identifies the occupation of their household's main breadwinner by selecting from a list of ISCO-88 titles. The respondent was asked "Please look at showcard [showcard #]. What best describes the occupation of the household's main breadwinner when you were 10?" The showcard contained the following list of job names/titles: "1. Legislator, senior official or manager, 2. Professional, 3. Technician or associate professional, 4. Clerk, 5. Service worker and shop and market sales worker, 6. Skilled agricultural or fishery worker, 7. Craft and related trades worker, 8. Plant and machine operator or assembler, 9. Elementary occupation, 10. armed forces." In addition, a code of 11 indicates that the respondent's household had no main breadwinner. In Wave 7, the respondent was asked an open-ended question "What best describes the occupation of the household's main breadwinner when you were 10?" SHARE then used the current ISCO-88 to classify and aggregate occupational information. These ISCO-88 codes were then reclassified into the same major group codes asked in the Wave 3 question.

Questions about the mother's and father's occupation when the respondent was age 10 are only available in Waves 6, 8, and 9.

Cross-Study Differences with the HRS

The HRS does not include an education variable coded according to the ISCED categories. HRS has 7 different categories: none, 1-11 grade, high school, some college, college grad, post college and other.

Unlike HRS, SHARE asked the occupation of the respondent's household's main breadwinner, the respondent's father, and the respondent's mother when the respondent was age 10 and not at age 16. In addition, SHARE uses a different occupation list than HRS.

How Constructed

rachshlt indicates the respondent's self-rated health status before the age of 16. This question was asked during Waves 3, 5, and 7. **rachshlt** is coded as follows: 1.excellent, 2.very good, 3.good, 4.fair, 5.poor, 6.health varied a great deal. **rachshlt** takes the first value reported. In Wave 5, **rachshlt** is based on SHARE derived variables which include imputations for missing values. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **rachfshlt** is the imputation flag indicating whether the value of **rachshlt** was imputed or not. A code of 1 indicates the value of **rachshlt** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **rachshlt** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed.

sWchshlt is the respondent's current wave's spouse's self-rated health status before the age of 16, and its values are taken from the spouse's value for **rachshlt**. **sWchfshlt** indicates whether the value of **sWchshlt** was imputed or not and is based on the respondent's spouse's value for **rachfshlt**. **sWchshlt** and **sWchfshlt** employ the special missing value (.u), when the respondent reports not being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rachinfect indicates whether the respondent had an infectious disease (e.g. measles, rubella, chickenpox, mumps, tuberculosis, diphtheria, scarlet fever) before the age of 16. This question was asked during Waves 3, 5, and 7. **rachinfect** is coded as 1 if the respondent reported having an infectious disease before age 16, and 0 if the respondent reported not having an infectious disease before age 16. In Wave 5, tuberculosis was removed as an example of an infectious disease and was asked about separately as its own question. To provide a consistent variable across all waves, the responses from the specific question about tuberculosis at Wave 5 are included in **rachinfect**. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

rachpolio, **rachasthma**, **rachresp**, **rachallerg**, **rachdiarrhoea**, **rachmening**, **rachearpr**, **rachspeechimp**, **rachseeingdif**, **rachhdache**, **rachepilepsy**, **rachpsych**, **rachbones**, **rachappdcts**, **rachdiab**, **rachheart**, **rachleuk**, and **rachcancer** indicate whether the respondent had a specific condition before the age of 16. These questions were asked during Waves 3, 5, and 7. **rachpolio** indicates whether the respondent had polio before the age of 16. **rachasthma** indicates whether the respondent had asthma before the age of 16. **rachresp** indicates whether the respondent had respiratory problems other than asthma before the age of 16. **rachallerg** indicates whether the respondent had allergies (other than asthma) before the age of 16. **rachdiarrhoea** indicates whether the respondent had severe diarrhoea before the age of 16. **rachmening** indicates whether the respondent had meningitis/encephalitis before the age of 16. **rachearpr** indicates whether the respondent had chronic ear problems before the age of 16. **rachspeechimp** indicates whether the respondent had a speech impairment before the age of 16. **rachseeingdif** indicates whether the respondent had difficulty seeing even with eyeglasses before the age of 16. **rachhdache** indicates whether the respondent had severe headaches or migraines before the age of 16. **rachepilepsy** indicates whether the respondent had epilepsy, fits, or seizures before the age of 16. **rachpsych** indicates whether the respondent had an emotional, nervous, or psychiatric problem before the age of 16. **rachbones** indicates whether the respondent had broken bones or fractures before the age of 16. **rachappdcts** indicates whether the respondent had appendicitis before the age of 16. **rachdiab** indicates whether the respondent had diabetes or high blood sugar before the age of 16. **rachheart** indicates whether the respondent had heart trouble before the age of 16. **rachleuk** indicates whether the respondent had leukaemia or lymphoma before the age of 16. **rachcancer** indicates whether the respondent had cancer or a malignant tumour (excluding minor skin cancers) before the age of 16. These variables are coded as 1 if the respondent reported having the condition before age 16, and are coded as 0 if the respondent reported not having the condition before age 16. These variables take the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

rachtb indicates whether the respondent had tuberculosis before the age of 16. This question was asked during Wave 5. **rachtb** is coded as 1 if the respondent reported having tuberculosis before age 16, and 0 if the respondent reported not having tuberculosis before age 16. In Waves 3 and 7, tuberculosis was included as an example in the question that asked if the respondent had an infectious disease before the age of 16 (see **rachinfect**). These responses are not included in **rachtb**. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question or they were not eligible for the mini childhood module in Wave 5. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

rachrickets indicates whether the respondent had rickets, osteomalacia, or rachitis before the age of 16. This question was asked during Wave 7. **rachrickets** is coded as 1 if the respondent reported having rickets, osteomalacia, or rachitis before age 16, and 0 if the respondent reported not having these conditions before age 16. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

sWchinfect, **sWchpolio**, **sWchasthma**, **sWchresp**, **sWchallerg**, **sWchdiarrhoea**, **sWchmening**, **sWchearpr**, **sWchspeechimp**, **sWchseeingdif**, **sWchtb**, **sWchhdache**, **sWchepilepsy**, **sWchpsych**, **sWchbones**, **sWchappdcts**, **sWchdiab**, **sWchheart**, **sWchleuk**, **sWchcancer**, and **sWchrickets** contain the corresponding information for the respondent's current wave's spouse and are taken from the spouse's values to **rachinfect**, **rachpolio**, **rachasthma**, **rachresp**, **rachallerg**, **rachdiarrhoea**, **rachmening**, **rachearpr**, **rachspeechimp**, **rachseeingdif**, **rachtb**, **rachhdache**, **rachepilepsy**, **rachpsych**, **rachbones**, **rachappdcts**, **rachdiab**, **rachheart**, **rachleuk**, **rachcancer**, and **rachrickets**. However, **sWchinfect**, **sWchpolio**, **sWchasthma**, **sWchresp**, **sWchallerg**, **sWchdiarrhoea**, **sWchmening**, **sWchearpr**, **sWchspeechimp**, **sWchseeingdif**, **sWchtb**, **sWchhdache**, **sWchepilepsy**, **sWchpsych**, **sWchbones**, **sWchappdcts**, **sWchdiab**, **sWchheart**, **sWchleuk**, **sWchcancer**, and **sWchrickets** employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rachvaccine indicates whether respondent received any vaccinations before the respondent was age 16. This question was asked during Waves 3, 5, and 7. **rachvaccine** is coded as 1 if the respondent reported receiving any vaccinations before age 16, and 0 if the respondent reported not having received any vaccinations before age 16. **rachvaccine** takes the first value reported. In Wave 5, **rachvaccine** is based on SHARE derived variables which include imputations for missing values. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't

know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **rachfvaccine** is the imputation flag indicating whether the value of **rachvaccine** was imputed or not. A code of 1 indicates the value of **rachvaccine** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **rachvaccine** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed.

sWchvaccine indicates whether the respondent's spouse received any vaccinations before the respondent's spouse was age 16 and is taken directly from the spouse's value for **rachvaccine**. **sWchfvaccine** indicates whether the value of **sWchvaccine** was imputed or not and is based on the respondent's spouse's value for **rachfvaccine**. **sWchvaccine** and **sWchfvaccine** employ the special missing value (.u), when the respondent reports not being coupled in the current wave, and the special missing value (.v), when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Self-rated health status during childhood and whether the respondent received any vaccinations during childhood are asked as part of Waves 3, 5, and 7.

In Wave 5, SHARE provides imputed values for both questions and these imputed values are incorporated into **rachshlt** and **rachvaccine**.

Questions about whether the respondent had specific medical conditions before the age of 16 are asked at Waves 3, 5, and 7. Whether the respondent had an infectious disease before the age of 16 was also asked at Waves 3, 5, and 7 but the language changed slightly during Wave 5. At Waves 3 and 7 the examples given for infectious diseases included measles, rubella, chickenpox, mumps, tuberculosis, diphtheria, scarlet fever. At Wave 5, tuberculosis was not included as an example. Instead Wave 5 included a separate question specifically about whether the respondent had tuberculosis before the age of 15. Due to these differences, we have created **rachtb** which captures any reports of tuberculosis at Wave 5, while **rachinfect** includes reports of any infectious diseases either from the general question about infectious diseases or from the specific question about tuberculosis at Wave 5.

Whether the respondent had rickets, osteomalacia, or rachitis before the age of 16 was only asked at Wave 7.

Cross-Study Differences with the HRS

Unlike HRS, SHARE asked one question on whether the respondent had an infectious disease (e.g. measles, rubella, chickenpox, mumps, diphtheria, scarlet fever) before age 16 and not separate questions for measles, mumps, and chickenpox.

HRS does not include questions asking whether the respondent had polio, severe diarrhoea, meningitis/encephalitis, tuberculosis, broken bones/fractures, appendicitis, leukaemia/lymphoma, cancer/malignant tumour (excluding minor skin cancers), or rickets/osteomalacia/rachitis before age 16.

The wording of the question asking whether the respondent had respiratory problems before age 16 slightly varied between HRS and SHARE. SHARE asks whether the respondent had "respiratory problems other than asthma". HRS asks whether the respondent had "a respiratory disorder such as bronchitis, wheezing, hay fever, shortness of breath, or sinus infection".

The wording of the question asking whether the respondent had allergies before age 16 slightly varied between HRS and SHARE. SHARE asks whether the respondent had "allergies (other than asthma)". HRS asks whether the respondent had "an allergic condition".

The wording of the question asking whether the respondent had chronic ear problems before age 16 slightly varied between HRS and SHARE. SHARE asks whether the respondent had "chronic ear problems". HRS asks whether the respondent had "chronic ear problems or infections".

The wording of the question asking whether the respondent had epilepsy or seizures before age 16 slightly varied between HRS and SHARE. SHARE asks whether the respondent had "epilepsy, fits, or seizures". HRS asks whether the respondent had "epilepsy or seizures".

The wording of the question asking whether the respondent had an emotional or psychiatric problem before age 16 slightly varied between HRS and SHARE. SHARE asks whether the respondent had an "emotional, nervous, or psychiatric problem". HRS asks whether the respondent had "any other emotional or psychological problems" because HRS also asks separate questions about depression and drug or alcohol problems.

The wording of the question asking whether the respondent had diabetes before age 16 slightly varied between HRS and SHARE. SHARE asks whether the respondent had "childhood diabetes or high blood sugar". HRS asks whether the respondent had "diabetes".

How Constructed

rWdeprex, **rWefforx**, **rWsleepx**, **rWflonex**, **rWfsadx**, **rWgoingx**, **rWwhappx**, and **rWenlifix** record the frequency of the respondent's feelings over the week prior to the interview. These variables use the following 4-point scale: 1.all or almost

all of the time, 2. most of the time, 3. some of the time, or 4. none or almost none of the time. Questions using this format were asked in Wave 1 in the drop-off questionnaire, so those who did not complete the self-completion questionnaire are assigned special missing value, (.c). Respondents who were part of the vignette sample did not complete the drop-off questionnaire and are assigned a special missing value, (.g), indicating they were part of the vignette sample.

rWdepres, **rWeffort**, **rWsleepr**, **rWflone**, **rWfsad**, **rWgoing**, **rWwhappy**, and **rWenlife** are yes/no indicators for whether the respondents experienced certain feelings much of the time during the week prior to the interview. A code of 0 indicates that the respondent did not experience a particular feeling. A code of 1 indicates that the respondent experienced a particular feeling. Questions using this format were asked in Wave 2 in the Activities module (AC) to a randomly selected sub-sample (random group = 1). Respondents who were not part of this random sample are assigned special missing value, (.s), indicating they skipped these questions due to survey design.

The variables **rWdeprex** and **rWdepres** indicate whether the respondent felt depressed. **rWefforx** and **rWeffort** indicate whether the respondent felt that everything was an effort. **rWsleeplx** and **rWsleepr** indicate whether sleep was restless. **rWflonex** and **rWflone** indicate whether the respondent felt lonely. **rWfsadx** and **rWfsad** indicate whether the respondent felt sad. **rWgoingx** and **rWgoing** indicate whether the respondent could not get going. **rWwhappx** and **rWwhappy** indicate whether the respondent was happy. **rWenlifx** and **rWenlife** indicate whether the respondent enjoyed life.

When respondents don't know, refuse to answer, or are missing, the variables are assigned special missing values (.d), (.r), or (.m), respectively. Variables are set to plain missing (.) for respondents who did not respond to the current wave.

sWdeprex, **sWefforx**, **sWsleeplx**, **sWflonex**, **sWfsadx**, **sWgoingx**, **sWwhappx**, and **sWenlifx** indicate whether the respondent's spouse reported any feelings and are taken directly from the spouse's **rWdeprex**, **rWefforx**, **rWsleeplx**, **rWflonex**, **rWfsadx**, **rWgoingx**, **rWwhappx**, and **rWenlifx**, respectively. **sWdepres**, **sWeffort**, **sWsleepr**, **sWflone**, **sWfsad**, **sWgoing**, **sWwhappy**, and **sWenlife** indicate whether the respondent's spouse reported any feelings and are taken directly from the spouse's **rWdepres**, **rWeffort**, **rWsleepr**, **rWflone**, **rWfsad**, **rWgoing**, **rWwhappy**, and **rWenlife**, respectively.

In addition to the special missing codes employed by the respondent variables, spouse variables employ two additional missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWcesd is the sum of **rWdepres**, **rWeffort**, **rWsleepr**, **rWflone**, **rWfsad**, **rWgoing**, (1-**rWwhappy**) and (1-**rWenlife**). Thus the higher the score, the more negative the respondent's feelings were during the past week. **rWcesdm** is the number of CESD questions with missing values, ranging from 0 to 8. **rWcesd** is calculated for all respondents who answered at least one of the CESD component questions, that is respondents with **rWcesdm** values of less than 8. **rWcesd** takes special missing values (.d), (.r), (.s) or (.m) if all component variables are missing. Plain missing (.) is assigned if the respondent did not respond to the current wave. In Wave 1 a CESD summary measure is not included.

sWcesd and **sWcesdm** are taken directly from the spouse's values of **rWcesd** and **rWcesdm**, respectively. In addition to the special missing codes employed by **rWcesd** and **rWcesdm**, **sWcesd** and **sWcesdm** employ two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 1, CESD questions eliciting mental health status were asked in the drop-off questionnaire to the non-vignette sample. Respondents were asked to report how often they experienced certain feelings over the past week on the following 4-point scale: all or almost all of the time, most of the time, some of the time, or none or almost none of the time. In Wave 2, CESD questions surveying mental health status were asked in the Activities module (AC) to a randomly selected sub-sample (random group = 1). These variables are yes/no indicators for whether the respondent experienced a certain feeling most of the time during the previous week. CESD questions surveying mental health status were not asked starting in Wave 4.

rWcesd and **rWcesdm** are only calculated for Wave 2.

CESD questions are not asked in any form after Wave 2.

Cross-Study Differences with the HRS

In SHARE Wave 1, CESD questions were asked using a 4-point answer scale, this is similar to how CESD questions were asked in HRS Wave 1, thus they share the naming convention: **rWdeprex**, **rWefforx**, **rWsleepx**, **rWflonx**, **rWfsadx**, **rWgoingx**, **rWwhappx**, and **rWenlifx**. In SHARE Wave 2, CESD questions were asked using yes/no answers, this is similar to how CESD questions were asked in HRS Wave 2 and forward thus they share the naming convention: **rWdepres**, **rWeffort**, **rWsleepr**, **rWflone**, **rWfsad**, **rWgoing**, **rWwhappy**, and **rWenlife**.

How Constructed

rWdepress, **rWpessim**, **rWsuicid**, **rWguilt**, **rWsleep**, **rWintrst**, **rWirritb**, **rWappett**, **rWfatig**, **rWconcnt**, **rWenjoym**, and **rWtearfl** record the respondent's answers to questions making up the EURO-D depression scale. These variables are coded with either a 0 or 1. A code of 0 indicates that the respondent's answer to the EURO-D component question is not indicative of depression. A code of 1 indicates that the respondent's answer to the EURO-D component question was a positive indicator of depression. Don't know, refused, and other missing responses to these variables are assigned special missing (.d), (.r), and (.m), respectively. In Wave 6, if these questions were not asked because the interview was partially or entirely by proxy, then these variables are assigned special missing (.p). In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked these questions. These variables are set to blank missing (.) if the respondent did not participate in the current wave.

rWdepress indicates whether the respondent answered yes when asked, "In the last month, have you been sad or depressed?"

rWpessim indicates whether the respondent mentioned any hopes for the future when asked, "What are your hopes for the future?"

rWsuicid indicates whether the respondent mentioned any suicidal feelings or wishing to be dead when asked, "In the last month, have you felt you would rather be dead?"

rWguilt indicates whether the respondent mentioned obvious feelings of guilt or self-blame when asked, "Do you tend to blame yourself or feel guilty about anything?" If the interviewer is unsure whether guilt or self-blame mentioned by the respondent is obvious or excessive, the interviewer follows up with the question, "So, for what do you blame yourself?" Based on the respondent's answer to this follow-up question the interviewer decides whether to categorize the examples given by the respondent as constituting obvious excessive guilt or self-blame and if so, the respondent is categorized as mentioning obvious feelings of guilt or self-blame.

rWsleep indicates whether the respondent reported having trouble with sleep or recent changes in their sleeping pattern when asked the question, "Have you had trouble sleeping recently?"

rWintrst indicates whether the respondent reported less interest than usual when asked, "In the last month, what is your interest in things?" If the interviewer is not able to determine whether the respondent has less interest than usual the interviewer follows up with the question, "So, do you keep up your interests?" If the respondent reports not keeping up their interests the respondent is categorized as having less interest than usual.

rWirritb indicates whether the respondent answered yes when asked, "Have you been irritable recently?"

rWappett indicates whether the respondent reported a diminution in the desire for food when asked, "What has your appetite been like?" If the interview is not able to determine whether the respondent's appetite has diminished the interviewer follows up with the question, "So, have you been eating more or less than usual?" If the respondent reports eating less than usual the respondent is categorized as having a diminished appetite.

rWfatig indicates whether the respondent answered yes when asked, "In the last month, have you had too little energy to do the things you wanted to do?"

rWconcnt indicates whether the respondent has difficulty in concentrating. The respondent is first asked, "How is your concentration? For example can you concentrate on a television programme, file or radio programme?" Next, the respondent is asked, "Can you concentrate on something you read?" If the respondent mentions both difficulty in concentrating on entertainment and difficulty in concentrating on reading the respondent is categorized as having difficulty in concentrating.

rWenjoym indicates whether the respondent mentions any enjoyable activity when asked, "What have you enjoyed doing recently?"

rWtearfl indicates whether the respondent answers yes when asked, "In the last month, have you cried at all?"

sWdepress, **sWpessim**, **sWsuicid**, **sWguilt**, **sWsleep**, **sWintrst**, **sWirritib**, **sWappett**, **sWfatig**, **sWconcnt**, **sWenjoym**, and **sWtearfl** indicate whether the respondent's spouse's answers to the EURO-D component questions were indicators of depression and are taken directly from the spouse's **rWdepress**, **rWpessim**, **rWsuicid**, **rWguilt**, **rWsleep**, **rWintrst**, **rWirritb**, **rWappett**, **rWfatig**, **rWconcnt**, **rWenjoym**, and **rWtearfl**, respectively. In addition to the special missing codes used by **rWdepress**, **rWpessim**, **rWsuicid**, **rWguilt**, **rWsleep**, **rWintrst**, **rWirritb**, **rWappett**, **rWfatig**, **rWconcnt**, **rWenjoym**, and **rWtearfl**, **sWdepress**, **sWpessim**, **sWsuicid**, **sWguilt**, **sWsleep**, **sWintrst**, **sWirritib**, **sWappett**, **sWfatig**, **sWconcnt**, **sWenjoym**, and **sWtearfl** employ two additional missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWeurod is the sum of **rWdepress**, **rWpessim**, **rWsuicid**, **rWguilt**, **rWsleep**, **rWintrst**, **rWirritb**, **rWappett**, **rWfatig**, **rWconcnt**, **rWenjoym**, **rWtearfl**. Thus the higher the score, the more indicative of depression. **rWeurod** is calculated for all respondents with imputed values provided by SHARE for respondents with missing values for scale. **rWfeurod** indicates whether the value of **rWeurod** is imputed. **rWfeurod** is taken directly from SHARE's EURO-D scale imputation flag. A code of 0 indicates that the respondent's **rWeurod** value was not imputed. A code of 1 indicates that the respondent's **rWeurod** value was imputed using SHARE's multiple imputation method. In Wave 7, only respondents who

were in Wave 3 (SHARELIFE Interview), and so were given the regular questionnaire in Wave 7, were asked these questions. **rWeurod** and **rWfeurod** are set to plain missing (.) for respondents who did not respond to any waves.

sWeurod is taken directly from the spouse's values of **rWeurod**. In addition to the special missings employed by **rWeurod**, **sWeurod** employs two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

sWfeurod flags imputations in the respondent's spouse's EURO-D scale and is taken directly from the spouse's **rWfeurod**. In addition to the special missings employed by **rWfeurod**, **sWfeurod** employs two additional special missing codes, (.u) and (.v). Special missing value (.u) is used when the respondent does not report being coupled in the current wave. Special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

In Wave 6, respondents who complete an interview completely or partially by proxy are not asked these questions and are assigned special missing (.p).

In Wave 7, only respondents who were in Wave 3 (SHARELIFE Interview) were asked these questions.

Cross-Study Differences with the HRS

The EURO-D scale is not surveyed in the HRS.

Single Item Life Satisfaction Question

Variable	Waves	Label	Type
rWsatlife_s	2, 4-9	rWsatlife_s:WW R Satisfied with life	Cont
sWsatlife_s	2, 4-9	sWsatlife_s:WW S Satisfied with life	Cont
rWsatlifez	2, 4-9	rWsatlifez:WW R Satisfied with life z-score	Cont
sWsatlifez	2, 4-9	sWsatlifez:WW S Satisfied with life z-score	Cont

How Constructed

rWsatlife_s and **rWsatlifez** indicate the respondent's level of life satisfaction. In SHARE, life satisfaction is rated by respondents on a scale of 0 to 10, with 0 being completely dissatisfied and 10 being completely satisfied. To make **rWsatlife_s** comparable across Harmonized datasets, responses to this question have been reverse-coded, so that **rWsatlife_s** is coded with lower scores indicating higher levels of life satisfaction. **rWsatlifez** is a z-scored version of the respondent's level of life satisfaction, and is calculated by z-scoring **rWsatlife_s**. **rWsatlife_s** and **rWsatlifez** are available starting in Wave 2. Different from all other waves, in Wave 6, if this question is not asked because the interview was by proxy, then this variable is assigned special missing (.p). Don't know, refused, and other missing values are assigned special missing (.d), (.r), and (.m), respectively. This variable is set to blank missing (.) if the respondent did not participate in the current wave.

sWsatlife_s and **sWsatlifez** indicate the current wave's spouse's level of life satisfaction, and their values are taken from the corresponding respondent variables. In addition to the special missing codes employed by the respondent variables, **sWsatlife_s** and **sWsatlifez** employ two additional special missing codes. A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

A question about satisfaction with life was added to SHARE starting in Wave 2. At Wave 6, this question was not asked if the interview was completed by a proxy on behalf of the respondent. In the case of this question being skipped because the interview was completed by a proxy, special missing (.p) is assigned. Starting at Wave 7, this question was again asked to proxy respondents.

Cross-Study Differences with the HRS

In the HRS, life satisfaction is asked using the response scale: 1.Completely Satisfied, 2.Very Satisfied, 3.Somewhat Satisfied, 4.Not Very Satisfied, and 5.Not At All Satisfied. However, in SHARE, life satisfaction is asked using a response scale of 0 to 10, with 0 being completely dissatisfied and 10 being completely satisfied. To provide variables which are comparable between the HRS and the SHARE, the Harmonized HRS contains a reverse-coded and z-scored version of the HRS respondent's answer to satisfaction with life and the Gateway Harmonized SHARE contains a z-scored version of the SHARE respondent's answer to satisfaction with life.

How Constructed

The following variables indicate how often the respondent feels like a particular statement - related to their quality of life - applies to them. Each of these items are coded to fit the following 4-point scale: 0.Never, 1.Not often, 2.Sometimes, 3.Often. These questions are asked in the Wave 1 drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then these variables are assigned special missing value (.c). Different from all other waves, in Wave 6, if these questions are not asked because the interview was by proxy, then these variables are assigned special missing (.p). Don't know, refused, or other missing values are assigned special missing codes (.d), (.r), (.m), respectively. These variables are set to plain missing (.) for respondents who did not respond to the current wave.

rWageprv indicates how often the respondent feels the following statement applies to them: "My age prevents me from doing the things I would like to."

rWoutcon indicates how often the respondent feels the following statement applies to them: "I feel that what happens to me is out of my control."

rWflftout indicates how often the respondent feels the following statement applies to them: "I feel left out of things."

rWcando indicates how often the respondent feels the following statement applies to them: "I can do the things that I want to do."

rWfamprv indicates how often the respondent feels the following statement applies to them: "Family responsibilities prevent me from doing what I want to do."

rWmshtge indicates how often the respondent feels the following statement applies to them: "Shortage of money stops me from doing things I want to do."

rWlookfwd indicates how often the respondent feels the following statement applies to them: "I look forward to each day."

rWlfemean indicates how often the respondent feels the following statement applies to them: "I feel that my life has meaning."

rWsnshappy indicates how often the respondent feels the following statement applies to them: "On balance, I look back on my life with a sense of happiness."

rWfenerg indicates how often the respondent feels the following statement applies to them: "I feel full of energy these days."

rWlifeopp indicates how often the respondent feels the following statement applies to them: "I feel that life is full of opportunities."

rWfutregd indicates how often the respondent feels the following statement applies to them: "I feel that the future looks good for me."

sWageprv, **sWoutcon**, **sWflftout**, **sWcando**, **sWfamprv**, **sWmshtge**, **sWlookfwd**, **sWlfemean**, **sWsnshappy**, **sWfenerg**, **sWlifeopp**, and **sWfutregd** indicate how often the respondent's current wave's spouse feels a particular statement related to their quality of life applies to them, and their values are taken from the corresponding respondent variables. In addition to the special missing codes employed by the respondent variables, the spouse variables employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWcntrlndx5 is a 5-item index of control. In order to calculate this summary score, **rWageprv**, **rWoutcon**, **rWflftout**, and **rWfamprv** are reverse-coded so that higher scores indicate more feelings of control. **rWcntrlndx5** equals $(3 - \text{rWageprv}) + (3 - \text{rWoutcon}) + (3 - \text{rWflftout}) + \text{rWcando} + (3 - \text{rWfamprv})$. **rWcntrlndx5m** is the count of the number of missing components for this summary. **rWcntrlndx5** is only summed if none of the components are missing. If any components are missing, then **rWcntrlndx5** is assigned special missing values (.d), (.r), or (.m). These questions are asked in the Wave 1 drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then this variable is assigned special missing value (.c). Different from all other waves, in Wave 6, if these questions are not asked because the interview was by proxy, then this variable is assigned special missing (.p). **rWcntrlndx5** is set to plain missing (.) for respondents who did not respond to the current wave.

rWautondx3 is a 3-item index of autonomy. In order to calculate this summary score, **rWmshtge** is reverse-coded so that a higher score indicate more feelings of autonomy. **rWautondx3** equals $(3 - \text{rWmshtge}) + \text{rWlookfwd} + \text{rWlfemean}$. **rWautondx3m** is the count of the number of missing components for this summary. **rWautondx3** is only summed if none of the components are missing. If any components are missing, then **rWautondx3** is assigned special missing values (.d), (.r), or (.m). These questions are asked in the Wave 1 drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then this variable is assigned special missing value (.c). Different from all other waves, in Wave 6, if these questions are not asked because the interview was by proxy, then this variable is assigned special missing (.p). **rWautondx3** is set to plain missing (.) for respondents who did not respond to the current wave.

rWplsrxndx2 is a 2-item index of pleasure. **rWplsrxndx2** equals **rWsnshappy** + **rWfenerg**. **rWplsrxndx2m** is the count of the number of missing components for this summary. **rWplsrxndx2** is only summed if none of the components are missing. If any components are missing, then **rWplsrxndx2** is assigned special missing values (.d), (.r), or (.m). These questions are asked in the Wave 1 drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then this variable is assigned special missing value (.c). Different from all other waves, in Wave 6, if these questions are not asked because the interview was by proxy, then this variable is assigned special missing (.p). **rWplsrxndx2** is set to plain missing (.) for respondents who did not respond to the current wave.

rWslfrlndx2 is a 2-item index of self-realization. **rWslfrlndx2** equals **rWlifeopp** + **rWfutregd**. **rWslfrlndx2m** is the count of the number of missing components for this summary. **rWslfrlndx2** is only summed if none of the components are missing. If any components are missing, then **rWslfrlndx2** is assigned special missing values (.d), (.r), or (.m). These questions are asked in the Wave 1 drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then this variable is assigned special missing value (.c). Different from all other waves, in Wave 6, if these questions are not asked because the interview was by proxy, then this variable is assigned special missing (.p). **rWslfrlndx2** is set to plain missing (.) for respondents who did not respond to the current wave.

rWcasp12 is a 12-item index of quality of life. In order to calculate this summary score, **rWageprv**, **rWoutcon**, **rWflftout**, **rWfamprv**, and **rWmshtge** are reverse-coded so that higher scores indicate higher quality of life. **rWcasp12** sums across 12 frequently used measures and equals $(3 - \text{rWageprv}) + (3 - \text{rWoutcon}) + (3 - \text{rWflftout}) + \text{rWcando} + (3 - \text{rWfamprv}) + (3 - \text{rWmshtge}) + \text{rWlookfwd} + \text{rWlfemean} + \text{rWsnshappy} + \text{rWfenerg} + \text{rWlifeopp} + \text{rWfutregd}$. **rWcasp12m** is the count of the number of missing components for this summary. **rWcasp12** is only summed if none of the components are missing. If any components are missing, then **rWcasp12** is assigned special missing values (.d), (.r), or (.m). These questions are asked in the Wave 1 drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then this variable is assigned special missing value (.c). Different from all other waves, in Wave 6, if these questions are not asked because the interview was by proxy, then this variable is assigned special missing (.p). **rWcasp12** is set to plain missing (.) for respondents who did not respond to the current wave.

sWcntrlndx5, **sWautondx3**, **sWplsrxndx2**, **sWslfrlndx2**, and **sWcasp12** are indices of control, autonomy, pleasure, self-realization, and quality of life, respectively. Their values are taken from the corresponding respondent variables. In addition to the special missing codes employed by the respondent variables, the spouse variables employ two additional special missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

These questions are asked in the Wave 1 drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then these variables are assigned special missing value (.c). Starting in Wave 2, these questions are asked in the main questionnaire. At Wave 6, this question was not asked if the interview was completed by a proxy on behalf of the respondent. In the case of this question being skipped because the interview was completed by a proxy, special missing (.p) is assigned. Starting at Wave 7, this question was again asked to proxy respondents.

Cross-Study Differences with the HRS

The HRS study includes the full 19-item version of the CASP survey while the SHARE only includes 12 of those measures. The overlap measures and summary variables are included as variables in the Harmonized HRS dataset to provide direct comparisons between SHARE and HRS.

Day Reconstruction: Characteristics of the Day

Variable	Waves	Label	Type
rWdrday	7	rWdrday:wW Day Reconstruction: r what day of the week was it yesterday	Categ
sWdrday	7	sWdrday:wW Day Reconstruction: s what day of the week was it yesterday	Categ
rWdrnrmlday	7	rWdrnrmlday:wW Day Reconstruction: r was yesterday a normal day for you	Categ
sWdrnrmlday	7	sWdrnrmlday:wW Day Reconstruction: s was yesterday a normal day for you	Categ

How Constructed

The following variables pertain to the respondent's experience yesterday. The respondent is given the following prompt, "We would like to ask you a few questions about YESTERDAY. Please take a short moment to first recall your activities and experiences yesterday." **rWdrday** indicates the day of the week yesterday, and is coded as follows: 1.Monday, 2.Tuesday, 3.Wednesday, 4.Thursday, 5.Friday, 6.Saturday, 7.Sunday. **rWdrnrmlday** indicates whether yesterday was a normal day for the respondent or if something unusual happened. **rWdrnrmlday** is coded as follows: 1.No, my day included unusually good things, 2.Yes, just a normal day, 3.No, my day included unusually bad (stressful) things. These questions are asked in the Wave 7 Switzerland drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then these variables are assigned special missing value (.c). Additionally, if the respondent was not from Switzerland, then these variables are assigned special missing value (.n). Values deemed by SHARE as implausible/suspected wrong responses are assigned special missing code (.i). Don't know, refused, or other missing values are assigned special missing codes (.d), (.r), (.m), respectively. These variables are set to plain missing (.) for respondents who did not respond to the current wave.

sWdrday, and **sWdrnrmlday** are variables indicating the respondent's spouse's experience yesterday, and their values are taken directly from the corresponding respondent variables. In addition to the special missing codes used in the respondent variables, the spouse variables employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Questions related to characteristics of the day were exclusively asked in SHARE Wave 7 Switzerland drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then these variables are assigned special missing value (.c). Additionally, these questions were only asked to respondents in Switzerland, so if the respondent was not from Switzerland, then these variables are assigned special missing value (.n).

Cross-Study Differences with the HRS

Comparable variables have been created in the Harmonized HRS. The HRS asks additional questions that are not asked in SHARE, including the day of the month, time the respondent woke up and went to sleep, whether they felt well rested, and a rating of their health.

How Constructed

The following variables pertain to the respondent's experience yesterday. The respondent is asked to rate how often they experienced a particular feeling yesterday. These questions are asked in the Wave 7 drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then these variables are assigned special missing value (.c). Additionally, these questions were only asked to respondents from Switzerland, so if the respondent was not from Switzerland, then these variables are assigned special missing value (.n). Values deemed by SHARE as implausible/suspected wrong responses are assigned special missing code (.i). Don't know, refused, or other missing values are assigned special missing codes (.d), (.r), (.m), respectively. These variables are set to plain missing (.) for respondents who did not respond to the current wave.

rWydfrust_s indicates how frustrated the respondent felt yesterday.

rWydsad_s indicates how sad the respondent felt yesterday.

rWydlonely_s indicates how lonely the respondent felt yesterday.

rWydcontent_s indicates how content the respondent felt yesterday.

rWydworrry_s indicates how worried the respondent felt yesterday.

rWydbored_s indicates how bored the respondent felt yesterday.

rWydhappy_s indicates how happy the respondent felt yesterday.

rWydangry_s indicates how angry the respondent felt yesterday.

rWydtired_s indicates how tired the respondent felt yesterday.

rWydstress_s indicates how stressed the respondent felt yesterday.

These variables are coded as 1.not at all, 2.a little, 3.somewhat, 4.quite a bit, 5.very.

rWydpain_s indicates how much pain the respondent felt yesterday. It is coded as 1.not at all, 2.a little, 3.some of the time, 4.quite a bit, 5.a lot.

sWydfrust_s, **sWydsad_s**, **sWydlonely_s**, **sWydcontent_s**, **sWydworrry_s**, **sWydbored_s**, **sWydhappy_s**, **sWydangry_s**, **sWydtired_s**, **sWydstress_s**, and **sWydpain_s** are variables indicating the respondent's spouse's experience yesterday, and their values are taken directly from the corresponding respondent variables. In addition to the special missing codes used in the respondent variables, the spouse variables employ two other missing codes, (.u)

and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWovexneg6_s is a 6-item index of overall experienced negative affect overall yesterday. **rWovexneg6_s** is the mean of **rWydfrust_s**, **rWydSad_s**, **rWydLonely_s**, **rWydWorry_s**, **rWydBored_s**, and **rWydAngry_s**. **rWovexneg6m_s** is the count of the number of missing components for this summary. **rWovexneg6m_s** is set to a special missing value if more than 2 items have a missing value, that is **rWovexneg6m_s** ranges from 3 to 6. These questions are asked in the Wave 7 drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then these variables are assigned special missing value (.c). Values deemed by SHARE as implausible/suspected wrong responses are assigned special missing code (.i). These questions were only asked to respondents in Switzerland, so if the respondent was not from Switzerland, then these variables are assigned special missing value (.n). Don't know, refused, or other missing values are assigned special missing codes (.d), (.r), (.m), respectively. These variables are set to plain missing (.) for respondents who did not respond to the current wave.

sWovexneg6_s and **sWovexneg6m_s** are summary scores for the respondent's spouse's negative affect items, and their values are taken directly from the corresponding respondent variables. In addition to the special missing codes used in the respondent variables, the spouse variables employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

rWovexpsy3_s is a 3-item index of overall experienced psychosomatic symptoms overall yesterday. **rWovexpsy3_s** is the mean of **rWydTired_s**, **rWydStress_s**, and **rWydPain_s**. **rWovexpsy3m_s** is the count of the number of missing components for this summary. **rWovexpsy3_s** is set to a special missing value if more than 1 item has a missing value, that is **rWovexpsy3m_s** ranges from 2 to 3. These questions are asked in the Wave 7 drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then these variables are assigned special missing value (.c). Values deemed by SHARE as implausible/suspected wrong responses are assigned special missing code (.i). These questions were only asked to respondents in Switzerland, so if the respondent was not from Switzerland, then these variables are assigned special missing value (.n). Don't know, refused, or other missing values are assigned special missing codes (.d), (.r), (.m), respectively. These variables are set to plain missing (.) for respondents who did not respond to the current wave.

sWovexpsy3_s and **sWovexpsy3m_s** are summary scores for the respondent's spouse's psychosomatic symptom items, and their values are taken directly from the corresponding respondent variables. In addition to the special missing codes used in the respondent variables, the spouse variables employ two other missing codes, (.u) and (.v). A special missing value (.u) is used when the respondent does not report being coupled in the current wave. A special missing value (.v) is used when the respondent reports being coupled in the current wave but their spouse is not interviewed.

Cross Wave Differences in SHARE

Questions related to characteristics of the day were exclusively added in SHARE Wave 7 Switzerland drop-off questionnaire, so if the respondent did not return the self-completion questionnaire, then these variables are assigned special missing value (.c). Additionally, these questions were only asked to respondents from Switzerland, so if the respondent was not from Switzerland, then these variables are assigned special missing value (.n).

Cross-Study Differences with the HRS

Comparable variables have been created in the Harmonized HRS. It is important to note the difference in question wording between HRS and SHARE; HRS asks how much a respondent felt a particular feeling yesterday while SHARE asks how often a respondent felt a particular feeling yesterday. Due to this discrepancy in question wording between HRS and SHARE, a "_s" is appended to the end of each variable name to show that these variables are SHARE-specific. Additionally, **rWovexpos3** and **rWovexpos3m** are not available in SHARE due to the absence of positive affect item **rWydenth_u**.
