Preface

The Survey of Health, Ageing and Retirement in Europe (SHARE) is a longitudinal household survey for the study of retirement and health among the elderly in continental Europe. It is modeled on the Health and Retirement Study (HRS) and the English Longitudinal Study of Ageing (ELSA), which are similar longitudinal surveys in the United States and England. Part of the reason for the close connection is to allow cross-country comparisons using these data. In place of a normal SHARE wave which focuses on current life circumstances of participants, SHARE had separate life history interviews in its third and seventh waves (often referred to as “SHARELIFE”). SHARELIFE includes retrospective information on previous histories, specifically, detailed data on previous partnership, children, residential, health, and work histories. The majority of the data collection of the third wave took place between autumn 2008 and summer 2009, and data collection in Wave 7 took place between spring and autumn 2017.

In order to make the SHARELIFE data more accessible to researchers and to facilitate such comparisons, we, Morten Wahrendorf from the University of Duesseldorf in Germany, Christian Deindl from the TU Dortmund University, and the USC Gateway to Global Aging Data team, created the Gateway Harmonized SHARE Life History, a user-friendly version of a subset of data from the SHARELIFE interviews. The Gateway Harmonized SHARE Life History initiative is part of a larger set of projects. With funding and support from National Institute on Aging, we have also created harmonized life history data for other studies, harmonized data from longitudinal core interviews, harmonized end of life data, and harmonized COVID data. The other harmonized life history data include the Harmonized ELSA Life History (England) and the Harmonized CHARLS Life History (China). The harmonized longitudinal core interview data include Harmonized HRS (United States), Harmonized MHAS (Mexico), Harmonized ELSA (England), Gateway Harmonized SHARE (Europe + Israel), Harmonized CRELES (Costa Rica), Harmonized KLoSA (South Korea), Harmonized JSTAR (Japan), Harmonized TILDA (Ireland), Harmonized CHARLS (China), Harmonized ELSI (Brazil), Harmonized SPS (Chile), Harmonized LASI (India), and Harmonized MARS (Malaysia). The harmonized end of life data include the Harmonized HRS End of Life (United States), Harmonized MHAS End of Life (Mexico), Harmonized ELSA End of Life (England), Gateway Harmonized SHARE End of Life (Europe + Israel), Harmonized KLoSA End of Life (South Korea), and Harmonized CHARLS End of Life (China). The harmonized COVID data include the Harmonized HRS COVID (United States), Harmonized ELSA COVID (England), and Gateway Harmonized SHARE COVID (Europe + Israel). Further information about these Harmonized data files with questionnaires and other metadata is available on our searchable website, <https://g2aging.org/>.

The Gateway Harmonized SHARE Life History includes variables with a similar data structure and naming conventions to other Harmonized Life History variables. This document describes the Gateway Harmonized SHARE Life History data derived from Waves 3 & 7 of SHARE.

The Gateway Harmonized SHARE Life History Data is not distributed by the Gateway and is instead distributed by the SHARE team. To access both the Gateway Harmonized SHARE Life

History data and the original SHARELIFE data visit: <https://share-eric.eu/data/>. Additional information about SHARE can be obtained from SHARE's website at share-eric.eu.

We are grateful for the continuing support of and funding from NIA. In interpreting the SHARE data, we greatly benefited from the help and insights of SHARE staff members. In particular, we thank Axel Börsch-Supan, Giuseppe De Luca, Dimitris Christelis, Enrica Croda, Martina Brandt and Stefan Gruber. We are indebted to Raquel Fonseca for her contributions in the early stage of this project. We have greatly benefited from discussions with and the suggestions from our colleagues Marco Angrisani, Arie Kapteyn, Jim Smith, Michael Hurd, Susann Rohwedder, Gema Zamarro, Bas Weerman, Michael Moldoff, Jeremy Lupoli, Regan Main, Tania Gutsche, Julie Zissimopoulos, Vincenzo Atella, Sara Zuzzi, Federico Belotti, Miriam Engels and Andrea Piano Mortari.

Requested Acknowledgment

We ask all users of the Gateway Harmonized SHARE Life History to please inform our team of any written analysis using data from the Gateway Harmonized SHARE Life History data or information from the Gateway Harmonized SHARE Life History codebook by sending an email to papers@g2aging.org. We also ask users to include the following acknowledgement in their written work:

"This analysis uses data or information from the Gateway Harmonized SHARE Life History dataset and codebook, Version G as of October 2024 developed by the Gateway to Global Aging Data in collaboration with the University of Duesseldorf. The development of the Gateway Harmonized SHARE Life History was funded by the National Institute on Ageing (R01 AG030153, RC2 AG036619, R03 AG043052). For more information, please refer to g2aging.org".

SHARE Version and Acknowledgment

This document uses data from SHARE Waves 3, 5, 6, 7, 8 and 9, release 9.0.0, as of March 2024. The SHARE data collection has been funded by the European Commission through the 5th framework programme (project QLK6-CT-2001-00360 in the thematic programme Quality of Life). Further support by the European Commission through the 6th framework programme (projects SHARE-I3, RII-CT-2006-062193, as an Integrated Infrastructure Initiative, COMPARE, CIT5-CT-2005-028857, as a project in Priority 7, Citizens and Governance in a Knowledge Based Society, and SHARE-LIFE (CIT4-CT-2006-028812)), through the 7th framework programme (SHARE-PREP (No 211909), SHARE-LEAP (No 227822), M4 (No 261982), and DASISH (No 283646); through Horizon 2020 (SHAREDEV3 (No 676536), SERISS (No 654221), SSHOC (No 823782), SHARE-COHESION (No 870628), SHARE-COVID19 (No 101015924), Rltrain (No 654156) and ERIC Forum (No 823798)), and by DG Employment, Social Affairs & Inclusion through VS 2015/0195, VS 2016/0135, VS 2018/0285, VS2019/0332, VS2020/0313, SHARE-EUCOV: GA No 101052589 and EUCOVII: GA No 101102412 is gratefully acknowledged. Substantial co-funding for add-ons such as the intensive training and retention program for SHARE interviewers and the collection of HRS-harmonised biomarkers was granted by the US National Institute on Aging (U01 AG09740-13S2, P01 AG005842, P01 AG08291, P30 AG12815, R21 AG025169, Y1-AG-4553-01, IAG BSR06-11, OGHA 04-064, BSR12-04, and R01AG052527-02), further funding was granted for the development of a Harmonized Cognitive Assessment Protocol (HCAP) (R01 AG056329-02). Substantial funding for the central coordination of SHARE was received from the German Federal Ministry for Education and Research (Bundesministerium für Bildung und Forschung, BMBF) and the Max Planck Society for the Advancement of Science. See <https://www.share-eric.eu/infrastructure/funding> for a full list of funding institutions.

What's New in Version G of the Gateway Harmonized SHARE Life History?

Version G incorporates the latest released version of SHARE data. It contains 91,680 observations or rows. It is a Respondent-level file so each row represents a unique Respondent. It makes adjustments and corrections.

We have added the following variables to the file:

- We added a character-based country indicator, **isoa3**.
- We added variables about the respondent's accommodation in childhood, including the number of rooms in their accommodation (**raccrooms**), the number of people living in the accommodation (**raccnpeople**), whether the accommodation had a bath (**raccbath**), cold running water supply (**raccwaterc**), hot running water supply (**raccwaterh**), an inside toilet (**racctoilet**), and central heating (**raccheating**), and the number of books (**raccbooks**).
- We added variables indicating the respondent's performance in math and language compared to other children: **raccmathperf** and **racclangperf**.
- We added variables indicating the respondent's mother's and father's education: **ramomediscd**, **radadediscd**, **ramomeducel**, **radadeducel**, **ramomeducl**, and **radadeducl**.
- We added variables indicating the respondent's parent's occupations: **ramaoccup_s**, **ramomoccup**, and **radadoccup**.
- We added a variable indicating the respondent's health status, **rachshlt**.
- We added variables indicating whether the respondent had particular health conditions: **rachinfect**, **rachpolio**, **rachasthma**, **rachresp**, **rachallerg**, **rachdiarrhoea**, **rachmening**, **rachearpr**, **rachspeechimp**, **rachseeingdif**, **rachtb**, **rachhdache**, **rachepilepsy**, **rachpsych**, **rachbones**, **rachappdcts**, **rachdiab**, **rachheart**, **rachleuk**, **rachcancer**, and **rachrickets**.
- We added a variable indicating whether the respondent received vaccines, **rachvaccine**.

1. Introduction and Overview

This report documents the Gateway Harmonized SHARE Life History data files, an age-sequenced collection of variables derived primarily from Wave 3 & Wave 7 of the Survey of Health, Ageing, and Retirement in Europe (SHARE), which is generally referred to as SHARELIFE.

SHARE is a cross-national panel survey of individuals over age 50 and their spouses or partners in a growing number of countries in continental Europe. Its main goal is to provide panel data that enable research and analysis in support of policies on retirement, health insurance, saving, and economic well-being. SHARELIFE was conducted as the third wave of SHARE and includes retrospective information on previous histories, specifically, detailed data on previous partnership, children, residential, health, and work histories. The seventh wave repeated this endeavor for all respondents who were not part of the original SHARELIFE. These were all respondents who joined SHARE through a refresher sample and all respondents from countries that joined SHARE after its third wave.

SHARE is sponsored by the European Commission, national funding agencies, and the (U.S.) National Institute of Aging (NIA), administered by national survey agencies and universities, and coordinated by the Munich Research Institute for the Economics of Aging and SHARE Analyses. The first wave was conducted in 2004-2005. The sample includes individuals born in 1954 or earlier. In addition to respondents from eligible birth years, the survey interviewed respondents' spouses or partners regardless of age.

SHARELIFE interviews include retrospective information on previous histories in five key domains, specifically, detailed data on previous partnership, children, residential, health, and work histories. To improve the answer quality given by the respondent, the information on histories is collected with a 'Life History Calendar' (or 'lifegrid'), where recall and timing of information is supported by a graphical representation of the life course that is filled out during the interview (Belli, 1998). More specifically, a calendar with the five life domains supports respondents in remembering their prior life courses where respondents and interviewers can also cross-reference between different histories (e.g. job when first child was born). The majority of the data collection for the first SHARELIFE took place between autumn 2008 and summer 2009. The majority of the data collection for the second SHARELIFE during Wave 7 took place between spring and autumn 2017. The Gateway Harmonized SHARE Life History provides remarkable opportunities for comparing the entire life course across 29 countries in Europe and to study its links with later life.

In Wave 3, 14 countries participated in SHARELIFE. In Wave 7, there are 26 European countries and Israel. Ireland and the Netherlands participated only in Wave 3. The Gateway Harmonized SHARE Life History includes any individual who participated in SHARELIFE. This includes individuals who were age-eligible for SHARE and their current partner, regardless if the partner was age-eligible. SHARE uses a multistage stratified sample. Its weighting variables make its data representative of the target populations in constituent countries. The most recent release

(as of October 2024) of the SHARE data is release 9.0.0, released in March 2024.

Documentation of the SHARE methodology can be found in Börsch-Supan et al. (2008), Börsch-Supan and Jürges (2005), and Börsch-Supan et al. (2013). Documentation for the whole SHARE study can be found in SHARE (2024). Documentation for SHARELIFE specifically can be found in SHARELIFE (2018).

1.1. Gateway to Global Aging Data

The Health and Retirement Study (HRS) has achieved remarkable scientific success, as demonstrated by an impressive number of users, research studies, and publications using it. Its success has generated substantial interest in collecting similar data as population aging has progressed in every region of the world.

The result has been a number of surveys designed to be comparable with the HRS: the Mexican Health & Aging Survey (MHAS), the English Longitudinal Study of Ageing (ELSA), the Survey of Health, Ageing and Retirement in Europe (SHARE), the Costa Rican Longevity and Healthy Aging Study (CRELES), the Korean Longitudinal Study of Aging (KLoSA), the Japanese Study on Aging and Retirement (JSTAR), the Irish Longitudinal Study on Ageing (TILDA), the China Health and Retirement Longitudinal Study (CHARLS), the Brazilian Longitudinal Study of Ageing (ELSI), the Northern Ireland Cohort Longitudinal Study of Ageing (NICOLA), the Chilean Social Protection Survey (SPS), the Malaysia Ageing and Retirement Survey (MARS), and the Longitudinal Aging Study in India (LASI). The overview of this family of surveys, including their research designs, samples, and key domains can be found in Lee, Phillips, and Wilkens (2019).

As these surveys were designed with harmonization as a goal, they provide remarkable opportunities for cross-country studies. The value of comparative analyses, especially the opportunities they offer for learning lessons resulting from policies adopted elsewhere, is widely recognized. Yet there are only a limited number of empirical studies exploiting such opportunities. This is partly due to the difficulty associated with learning multiple surveys and the policies and institutions of each country.

Identifying comparable questions across surveys is the first step toward cross-country analyses. The Gateway to Global Aging Data (Gateway) helps users understand and use these large-scale population surveys on health and retirement. The Gateway includes several tools to facilitate cross-national health and retirement research. It includes a digital library of survey questions for all participating surveys. Its search engine enables users to find relevant survey questions. The Gateway also includes a concordance with information comparing measures within and across surveys over time. Using these tools, researchers can identify all questions related to particular key words or within a domain. The Gateway also includes population and sub-population estimates for key harmonized variables and present them in graphs and tables that can be downloaded.

The Gateway can be accessed at <https://g2aging.org>. For more information about using the Gateway visit the Help page. For more information about creating the Gateway Harmonized SHARE Life History using the Gateway see “Chapter 3. Distribution and Technical Notes.”

1.2. Units of Observation

The Gateway Harmonized SHARE Life History data uses the individual as the only unit of observation. Unlike the Gateway Harmonized SHARE data which also includes variables which represent the couple and household, the Gateway Harmonized SHARE Life History data only includes observations specific to the individual person. In the case that two individuals who are partnered both participated in SHARELIFE, their reports are specific to themselves and no agreement between partners is requested, checked, or implied.

1.3. Data File Structure

The Gateway Harmonized SHARE Life History data are contained in a single file where each observation represents one individual. The harmonized sequence data from the life history interview is arranged in a state sequence format. This means that the data contains a state variable for each age covered in the life history interview to describe the state at a particular age (e.g. work situation or total number of children at the age of 20, 21, 22, 23, 24, ...etc.). This format has been created by rearranging the original data, which are provided in a “wide spell-data format”. This original format provides information on all spells to which the respondent gave information (e.g. details on job spells, together with information on the beginning and the end of the job spell). The state sequence format, in contrast, appears more intuitive and user-friendly than a spell format and has several advantages. For example, it directly allows the description of the circumstance at a specific age (without need of extensive data management) and fully exploits the longitudinal nature of the data by providing information for each age covered in the life history interview. It also allows the derivation of the summary measures of interest (e.g. years spent in a specific state) and the application of methods of sequence analysis (Gabadinho, Ritschard, Müller, & Studer, 2011; Halpin, 2017) for an in-depth study of histories. Each individual is uniquely identified by the unique identifier **mergeid**.

This file may be merged with other SHARE data or the Gateway Harmonized SHARE data using **mergeid**.

1.4. Variable Naming Convention

With few exceptions, variable names in the Gateway Harmonized SHARE Life History data follow a consistent pattern. The first characters indicate which domain the state variable refers to: “work” = work history, “prtn” = partner history, “chld” = children history, “hlth” = health history, and “rsid” = residential history (or accommodation). The last character indicates the age to which the state variable refers (e.g. 20, 21, 22, 22, 23, ...). For example:

workstate25
└──┬── At age 25
 └── Employment situation

Variable **workstate25** captures the employment situation of the individual at age 25 as reported by the respondent during the SHARELIFE interview.

In the text below, we may refer to variables such as **workstate15-80** for example, without specifying an age. This reference points at the group of variables **workstate15**, **workstate16**, ..., **workstate79**, **workstate80**.

Variable labels also follow a consistent pattern. The first characters denote the name of the variable, followed by a colon. Then follows the unit to which the variable refers (“R” for reference person). The remainder of the label describes the concept that the variable captures and the age to which it refers. For example, the variable label of **workstate25** is:

workstate25: r work state at age 25

It may seem duplicative to include the name of the variable in the variable label. However, statistical packages often suppress the variable name and instead use its label in the presentation of results.

Variable names in the Gateway Harmonized SHARE Life History are meant to be identical where possible with variable names in other Harmonized Life History datasets. Measures in other Harmonized Life History data which are deemed only somewhat comparable with Gateway Harmonized SHARE Life History version will often end with an underscore and a letter representing that study, for instance “_E”, if the comparable measure in the Harmonized ELSA Life History data is only somewhat comparable to the measure in the Gateway Harmonized SHARE Life History.

1.5. Missing Values

Variables may contain missing values for several reasons. Stata, SAS, and SPSS offer the capability to distinguish multiple types of missing values, and we have attempted to record as much information as possible. Generally, the codes adhere to the classification in Table 1.

Table 1. Missing Codes

Code	Reason for missing
.d	Don't know
.r	Refused
.a	Not yet reached this age at the time of the survey
.m	Other missing

The coding scheme varies across variables. Consult the Data Codebook for details on individual variables.

2. Structure of Codebook

The Data Codebook contains the codebook documenting all variables in the Gateway Harmonized SHARE Life History Data. This section explains how to interpret the codebook entries. The figure below shows a typical codebook page; the numbers in circles correspond to comments below.

Partnership

Wave	Variable	Label	Type
A	PRTNSTATE15-80	PRTNSTATE##: r partnership state at age 15-80	Categ

Variable	N	Mean	Std Dev	Minimum	Maximum
PRTNSTATE15	91680	1.00	0.07	1.00	2.00
PRTNSTATE16	91680	1.01	0.11	1.00	2.00
PRTNSTATE17	91680	1.03	0.17	1.00	2.00
PRTNSTATE18	91680	1.07	0.25	1.00	2.00
PRTNSTATE19	91680	1.13	0.33	1.00	2.00
PRTNSTATE20	91680	1.21	0.41	1.00	2.00
PRTNSTATE21	91680	1.30	0.46	1.00	2.00

Value	Label
.a	age not applicable
1	living alone
2	living with partner

How Constructed

Partnership history variables include **prtnstate15-80**. These variables indicate whether the respondent was living with a partner or living alone, regardless of marital status, at each age between 15 and 80 years old. **prtnstate15-80** are coded as: 1. Living alone and 2. Living with partner. Special missing (.a) is assigned when the respondent has not yet reached the age indicated by the particular variable at the time of the life history survey. For example, if the respondent completed the life history survey at age 60, **prtnstate61** to **prtnstate80** would be assigned (.a).

Partnership histories were constructed using each instance of partnership reported in the interview. Specifically, we used information on when respondents started living with a partner (beginning of spell) and, if they stopped living with the same partner, the age they stopped living with him or her (end of spell). The end of cohabitation could be because a partner had died, there was a breakup of the relationship, a partner moved into a nursing or care home or for other reasons. To identify the annual partnership state, start and end spell dates were attached to the associated ages.

Cross-Wave Differences in SHARE

No differences known.

9

→ SHARE Variables Used

Wave 3 Life History:

1

Title: The variables are documented in groups according to the concept that they measure. The title is often followed by a short description of the concept that is captured.

2

Variable Names: This entry shows the names of variables in the group.

3

Variable Labels: This entry shows the Stata variable labels. As discussed above, the labels typically include the name of the variable, the file on which it is present, and a description of its contents.

4

Variable Type: This entry indicates the type of variable. It may be continuous (Cont), categorical (Categ), or character (Char).

5

Descriptive Statistics: This entry shows descriptive statistics on each variable. They include the number of nonmissing values, the mean, standard deviation, minimum value, and maximum value.

6

Categorical Value Codes: This entry shows the value label codes. These are only relevant for categorical variables. The first character(s) of the value labels indicate the value to which each label has been assigned. For example, value “1” is mapped into “1. living alone” (not just “living alone”). These values will be used for all variables in the group referenced (for example **prtnstate15-80**).

7

How Constructed: This entry provides background on the manner in which variables were constructed.

8

Cross-Wave Differences in SHARE: This entry briefly describes differences in question wording or contents between life history interview waves. Note that life history interviews have only occurred in two waves of SHARE.

- 9 *SHARE Variables Used*: This entry provides the names and labels of raw SHARE variables that were used to construct the new variables.

3. Distribution and Technical Notes

The Gateway Harmonized SHARE Life History data file is distributed through the SHARE website along with the original SHARE data. The Gateway Harmonized SHARE Life History data file is made available free of charge but only to users who register with the SHARE and agree to the standard conditions. For more information on obtaining access to the SHARE data, visit: <https://share-eric.eu/data/data-access>.

This is version **G** of the Gateway Harmonized SHARE Life History data.

A copy of this Gateway Harmonized SHARE Life History codebook can be obtained on the Gateway to Global Aging Data under the Harmonized Data and Get Data tabs (<https://g2aging.org/hrd/get-data>).

How Constructed

SHARE provides a unique identifier for each respondent across waves, **mergeid**.

country is the SHARE country identifier. **country** is a 2-digit code ranging from 11 to 47 which represents the country in which the respondent was surveyed. The codes are mapped as follows: 11.Austria, 12.Germany, 13.Sweden, 14.Netherlands, 15.Spain, 16.Italy, 17.France, 18.Denmark, 19.Greece, 20.Switzerland, 23.Belgium, 25.Israel, 28.Czech Republic, 29.Poland, 30.Ireland, 31.Luxembourg, 32.Hungary, 33.Portugal, 34.Slovenia, 35.Estonia, 43.Slovenia, 47.Croatia, 48.Lithuania, 51.Bulgaria, 53.Cyprus, 55.Finland, 57.Latvia, 59.Malta, 61.Romania, and 63.Slovakia. **country** is helpful for a variety of purposes because the survey questionnaires varied among the countries that participated in SHARE.

isocountry is a modified version of the SHARE variable **country**. Using ISO 3166-1 (numeric-3) codes, **isocountry** indicates the country in which surveying took place. The codes are mapped as follows: 40.Austria, 56.Belgium, 100.Bulgaria, 191.Croatia, 196.Cyprus, 203.Czech Republic, 208.Denmark, 233.Estonia, 246.Finland, 250.France, 276.Germany, 300.Greece, 348.Hungary, 372.Ireland, 376.Israel, 380.Italy, 428.Latvia, 440.Lithuania, 442.Luxembourg, 470.Malta, 528.Netherlands, 616.Poland, 620.Portugal, 642.Romania, 703.Slovakia, 705.Slovenia, 724.Spain, 752.Sweden, and 756.Switzerland. **isocountry** is helpful for matching respondents to country-level statistics where countries are often identified using ISO codes.

isoa3 are three-letter country codes which indicate the country in which surveying took place. The codes are mapped as follows: AUT-Austria, BEL-Belgium, BGR-Bulgaria, HRV-Croatia, CYP-Cyprus, CZE-Czech Republic, DNK-Denmark, EST-Estonia, FIN-Finland, FRA-France, DEU-Germany, GRC-Greece, HUN-Hungary, IRL-Ireland, ISR-Israel, ITA-Italy, LVA-Latvia, LTU-Lithuania, LUX-Luxembourg, MLT-Malta, NLD-Netherlands, POL-Poland, PRT-Portugal, ROU-Romania, SVK-Slovakia, SVN-Slovenia, ESP-Spain, SWE-Sweden, and CHE-Switzerland. **isoa3** is helpful for matching respondents to country-level statistics where countries are often identified using ISO codes.

Cross Wave Differences in SHARE

The Czech Republic, Poland, and Ireland were added in Wave 2. Hungary, Portugal, Slovenia and Estonia were added in Wave 4. Luxemburg was added in Wave 5. Croatia was added in Wave 6. Bulgaria, Cyprus, Finland, Latvia, Lithuania, Malta, Romania and Slovakia were added in Wave 7.

SHARELIFE Variables Used

Tracker File:	
COUNTRY	country identifier
MERGEID	person identifier (fix across modules and waves)

Wave Status: Response Indicator

Wave	Variable	Label	Type
1	INW3LH	inw3lh: =1 if respondent w3 life history	Categ
1	INW7LH	inw7lh: =1 if respondent w7 life history	Categ

Descriptive Statistics

Variable	N	Mean	Std Dev	Minimum	Maximum
INW3LH	91680	0.31	0.46	0.00	1.00
INW7LH	91680	0.69	0.46	0.00	1.00

Categorical Variable Codes

Value-----	INW3LH
0.nonresp	63226
1.resp,alive	28454
Value-----	INW7LH
0.nonresp	28447
1.resp,alive	63233

How Constructed

inw3lh indicates whether an individual responded to a particular wave's life history questionnaire. A code of 0 indicates the respondent is not included in the SHARELIFE life history questionnaire file. A code of 1 indicates that the respondent at least partially completed the life history questionnaire and is included in life history questionnaire file. The life history questionnaire was given in Wave 3 and Wave 7. Those respondents who did not respond to the Wave 3 SHARELIFE life history questionnaires were given the life history questionnaire in Wave 7 and participated in the SHARELIFE questionnaire in Wave 3 were given the full questionnaire in Wave 7.

Cross Wave Differences in SHARE

The SHARELIFE life history questionnaires were given in Wave 3 and Wave 7. Those respondents who did not respond to the Wave 3 SHARELIFE life history questionnaires were given the questionnaire in Wave 7 and those who were given the SHARELIFE questionnaire in Wave 3 responded to the regular Wave 7 questionnaire only.

SHARELIFE Variables Used

Tracker File:		
INTERVIEW_W3		interview done (wave 3)
INTERVIEW_W7		interview done (wave 7)
Wave 7 Life History:		
SHARELIFE		dummy for respondent's sharelife interview

Demographics

Wave	Variable	Label	Type
3	R3AGEY	r3agey:w3 r age (years) at ivw	Cont
7	R7AGEY	r7agey:w7 r age (years) at ivw	Cont

RAGENDER	91680	1.57	0.50	1.00	2.00

Categorical Variable Codes

Value-----	RAGENDER
1.male	39705
2.female	51975

How Constructed

rWagey is the respondent's age in years at the time of the current wave's interview. When respondents don't know or refuse to answer, **rWagey** is assigned special missing values (.d) or (.r), respectively. Otherwise missing responses are assigned special missing (.m). **rWagey** is set to plain missing (.) for respondents who did not respond to the current wave.

rabyear is the respondent's reported birth year. **rabmonth** is the respondent's reported month of birth. **rabyear** and **rabmonth** are taken from the SHARE tracker file. Otherwise missing responses are assigned special missing (.m).

ragender is derived using the gender variable in the SHARE tracker file. A value of 1 indicates the respondent is male. A value of 2 indicates the respondent is female. Otherwise missing responses are assigned special missing (.m).

Cross Wave Differences in SHARE

No differences known.

SHARELIFE Variables Used

Tracker File:	
AGE_INT_W3	age of respondent at the time of interview (wave 3)
AGE_INT_W7	age of respondent at the time of interview (wave 7)
GENDER	male or female
MOBIRTH	month of birth
YRBIRTH	year of birth

R3WTRESP	27882	4812.32	6271.63	212.01	225600.30
R7WTRESP	62138	2794.92	5061.85	15.78	231921.89

How Constructed

The sampling weights **rwwtsamp** are taken directly from SHARE's **dw_ww** variables, which are the sampling design weights at the individual and household levels. Because the inclusion probability of any eligible household member is the same as the inclusion probability of the whole household, these weights account for both the individual and the household. These weights are defined as the inverse of the probability of being included in the sample at each wave, allowing users to compensate for unequal selection probabilities of the sample units.

rapsu1 and **rapsu2** are taken directly from the primary and secondary sampling units provided by SHARE. Cyprus, Denmark, Estonia, Ireland, Luxembourg, Malta, Switzerland, and Greece and Poland in Waves 1 and 2 have no values for **rapsu1**. **rapsu1** values are missing for much of the sample for Waves 4 and forward in France and for much of the sample for all waves in Greece, Poland, and Sweden. **rapsu2** values are only provided for Hungary, Italy, Portugal, and Spain. Otherwise missing assignments are assigned special missing (.m).

raestrat1 and **raestrat2** are taken directly from the two stratum variables provided by SHARE. Denmark, Germany, Ireland, and Netherlands have no values for **raestrat1**. **raestrat1** values are missing for much of the sample for Waves 4 and forward in France, for Waves 5 and forward for Spain, and for Waves 2 and forward for Sweden. **raestrat2** values are only provided for Hungary, Italy, Poland, Romania, Slovakia, Slovenia, and Switzerland. Otherwise missing assignments are assigned special missing (.m).

rwwtresp is taken directly from SHARE's respondent weight variables **cciw_ww** for Wave 3 and **cciw_w7_SHL** for Wave 7, which are calibrated cross-sectional weights. Cross-sectional respondent weights are based on the household design weight and the calibration variables of the respondent. Cross-sectional respondent

weights are only generated for respondents age 50 or older. SHARE’s calibration is based on the size of each country’s populations of individuals born in 1964 or earlier across eight gender-age groups. Otherwise missing assignments are assigned special missing (.m). **rwwtresp** is set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

No differences known.

SHARELIFE Variables Used

Wave 3 Life History:

CCIW_W3	calibrated cross-sectional individual weight - wave 3
DW_W3	design weight - wave 3
PSU	primary sampling unit
SSU	secondary sampling unit (if any)
STRATUM1	indicator for primary stratum (if any)
STRATUM2	indicator for secondary stratum (if any)

Wave 7 Life History:

CCIW_W7_SHL	calibrated (cross-sectional) individual weight - share
DW_W7	design weight - wave 7
PSU	primary sampling unit
SSU	secondary sampling unit (if any)
STRATUM1	indicator for primary stratum (if any)
STRATUM2	indicator for secondary stratum (if any)

Interview Dates

Wave	Variable	Label	Type
3	R3IWM	r3iwm:w3 interview month	Cont
7	R7IWM	r7iwm:w7 interview month	Cont
3	R3IWY	r3iwy:w3 interview year	Cont
7	R7IWY	r7iwy:w7 interview year	Cont

Descriptive Statistics

Variable	N	Mean	Std Dev	Minimum	Maximum
R3IWM	28454	5.15	3.97	1.00	12.00
R7IWM	63233	6.13	1.98	1.00	12.00

R7IWY	63233	2017.01	0.12	2017.00	2019.00

How Constructed

These variables are derived from the reported month and year when the interview took place.

rWiwm and **rWiwy** indicate the interview month and year, respectively. **rWiwm** and **rWiwy** are set to plain missing (.) for respondents who did not respond to the current wave.

Cross Wave Differences in SHARE

No differences known.

How Constructed

Work history variables include **workstate15-80** and **hwrkstate15-80**. These variables indicate the employment status of the respondent by age from age 15 to age 80.

workstate15-80 are constructed using paid work and unpaid or not working employment histories to identify respondents into eight defined employment states. These variables are coded as: 1. Employed full-time, 2. Employed part-time, 3. Self-employed, 4. Unemployed, 5. Home/family work, 6. Retired, 7. Full-time education, and 8. Other. Special missing (.a) is assigned when the respondent has not yet reached the age indicated by the particular variable at the time of the life history survey. For example, if the respondent completed the life history survey at age 60, **workstate61** to **workstate80** would be assigned (.a). Otherwise missing responses are assigned special missing (.m).

hwrkstate15-80 are constructed using paid work and unpaid or not working employment histories to identify respondents into seven defined employment states. These variables are coded as: 1. Employed, 2. Self-

employed, 3. Unemployed, 4. Home/family work, 5. Retired, 6. Full-time education, and 7. Other. Special missing (.a) is assigned when the respondent has not yet reached the age indicated by the particular variable at the time of the life history survey. For example, if the respondent completed the life history survey at age 60, **hwrkstate61** to **hwrkstate80** would be assigned (.a). Otherwise missing responses are assigned special missing (.m).

Determining full-time education status at a given age first considers the time in which the respondent reports they finished full-time education. It is then assumed that the respondent was in full-time education prior to this time.

Details regarding job spells, up to 20 jobs, are used to determine whether the respondent worked at a given age. Specifically, start and end spell dates are attached to the associated ages, details on whether self-employed and, only in Wave 3, whether full-time or part-time. Paid employment lasting 6 months or more was reported. In a few cases at Wave 3, respondents also reported changes in working hours within job spells, e.g. moving from full-time to part-time employment and vice-versa. We used information on when these changes occurred to specify working hours. We did not consider working hours in cases of self-employment, because part-time self-employment was too seldom in the data (about 1% of working people across all ages).

SHARELIFE asked about periods in which respondents were not working, either before the first job spell, between two job spells, or after the last job spell. Again, details on start and end of respective spells were used, and we determined if the gap was because of being unemployed (both searching and not searching for a job), home or family work, retirement, or a remaining group of other. The other category includes being sick or disabled, voluntary work, military services and travelling.

Full-time education periods, paid employment periods, and unpaid or not working periods were combined into one final work history. In the infrequent case that respondents reported both paid employment and a period of unpaid or not working employment, including full-time education, we prioritized information regarding unpaid or not working periods, followed by paid employment and education.

Cross Wave Differences in SHARE

In Wave 3 respondents can indicate changes in their working hours. It is therefore possible to distinguish between full-time and part-time employment. At Wave 7 SHARE does not any longer offer this possibility. To account for this difference we created variables containing the Wave 3 employment history (including the distinction between full-time and part-time employment) and another set of variables containing the Wave 7 employment history (without such a distinction).

SHARELIFE Variables Used

Wave 3 Life History:

SL_RE002_	year finished fulltime education
SL_RE003_	situation at age 15 if no education
SL_RE005_	ever done paid work
SL_RE006_	start first paid job
SL_RE007_	situation in gap after education

Categorical Variable Codes

Value-----	PRTNSTATE##
.a:age not applicable	
1.living alone	
2.living with partner	

How Constructed

Partnership history variables include **prtnstate15-80**. These variables indicate whether the respondent was living with a partner or living alone, regardless of marital status, at each age between 15 and 80 years old. **prtnstate15-80** are coded as: 1. Living alone and 2. Living with partner. Special missing (.a) is assigned when the respondent has not yet reached the age indicated by the particular variable at the time of the life history survey. For example, if the respondent completed the life history survey at age 60, **prtnstate61** to **prtnstate80** would be assigned (.a). Otherwise missing responses are assigned special missing (.m).

Partnership histories were constructed using each instance of partnership reported in the interview. Specifically, we used information on when respondents started living with a partner (beginning of spell) and, if they stopped living with the same partner, the age they stopped living with him or her (end of spell). The end of cohabitation could be because a partner had died, there was a breakup of the relationship, a partner moved into a nursing or care home or for other reasons. To identify the annual partnership state, start and end spell dates were attached to the associated ages.

Although SHARE distinguishes between a married or a non-married partnership, we decided not to differentiate by marital status to keep the variable more comparable to Harmonized Life History data.

How Constructed

Children histories provide information regarding whether the respondent had children and how many children they had at each age between age 15 and age 80. **chldstate15-80** indicate the total number of living children, regardless of age. **ychdstate15-80** indicate the total number of living children under the age of 18. In both cases, biological and adopted children are considered. Special missing (.a) is assigned when the respondent has not yet reached the age indicated by the particular variable at the time of the life history survey. For example, if the respondent completed the life history survey at age 60, **chldstate61** to **chldstate80** would be assigned (.a). Otherwise missing responses are assigned special missing (.m).

To define the age each respondent had a child, the year of birth was used for biological children and the year of adoption was used for children who were adopted. In addition, we used information on year of death in the case that a child died. For **ychdstate15-80**, we considered the age of the child (based on year of birth for both biological and adopted children) and counted how many children respondents had below the age of 18. For children who were adopted, we checked the year of adoption did not contradict age.

If users are interested in counting the number of children at other ages, users may easily modify the provided do-files.

Categorical Variable Codes

Value-----	HLTHSTATE##
.a:age not applicable	
1.without illness	
2.with illness	
3.ill most of the life	

How Constructed

Health history variables include **hlthstate16-80**. These variables indicate whether the respondent had periods of poor health or disability by age from age 16 to age 80. **hlthstate16-80** are coded as: 1. Without illness, 2. With illness, and 3. Ill most of life. Special missing (.a) is assigned when the respondent has not yet reached the age indicated by the particular variable at the time of the life history survey. For example, if the respondent completed the life history survey at age 60, **hlthstate61** to **hlthstate80** would be assigned (.a). Otherwise missing responses are assigned special missing (.m).

Respondents were asked how many periods of poor health or disability (lasting more than a year) they had in their life from age 16 onwards. If the number of periods of poor health or disability was more than three, details on when the periods occurred were not asked and people were classified as “Ill most of the life” throughout the histories. In contrast, if the respondent answered three or less periods, respondents were additionally asked to report when the respective periods were. For this, SHARELIFE respondents reported the precise years when each period started and ended.

If users are interested in more specific health measures (e.g. lifetime prevalence of specific diseases), we recommend using information from core waves where different diseases and their age at onset are assessed.

Cross Wave Differences in SHARE

No differences known.

Categorical Variable Codes

Value-----	RSIDSTATE##
1.owner	
2.tenant	
3.non-private / other	
4.abroad	
5.parental home	

How Constructed

Residential histories include **rsidstate15-80**. These variables account for different types of private housing (owner or tenant) together with information on whether the residence was abroad and the year when respondents established their own household. Details for all housing spells were used to identify the residential state for each age between 15 and 80 years old. **rsidstate15-80** are coded as: 1. Owner, 2. Tenant, 3. Non-private/other, 4. Abroad, and 5. Parental home. Special missing (.a) is assigned when the respondent has not yet reached the age indicated by the particular variable at the time of the life history survey. For example, if the respondent completed the life history survey at age 60, **rsidstate61** to **rsidstate80** would be assigned (.a). Otherwise missing responses are assigned special missing (.m).

Residential histories combine details regarding the respondent’s housing spells, including reported year they left their parents’ home and reported year they established their own household, if applicable. The beginning and the end of all residences were associated to each age and assigned values according to provided details regarding specific residential state. Non-private or private residence, and – in case of a private residence - rented (“renting”) or owned (“ownership”) information was used.

In SHARELIFE, respondents could report up to 28 housing spells that lasted 6 months or longer. Types of residences that could not be classified as tenant or owner (e.g. rent-free) or that were reported as non-private residence (e.g. boarding schools, hospitals or prisons) were classified into “non-private / other”. To classify residences as “abroad” we used information on whether the residence was in the country or not. We did not distinguish between types of residences abroad because the number of people who lived abroad was small.

If users are interested in additional accommodation sequences, e.g. further classifying abroad residences, we suggest modifying the provided do-files to create the state-definitions.

How Constructed

raccrooms indicates the number of rooms the respondent's household occupied, including bedrooms but excluding kitchen, bathrooms and hallways, when the respondent was age 10. This question was asked during Waves 3, 5, and 7. **raccrooms** takes the first reported value. In Wave 5, **raccrooms** is based on SHARE derived variables which include imputations for missing values. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **raccfrooms** is the imputation flag indicating whether the value of **raccrooms** was imputed or not. A code of 1 indicates the value of **raccrooms** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **raccrooms** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed.

raccnpeople indicates the number of people living in the respondent's household when the respondent was age 10. This question was asked during Waves 3, 5, and 7. **raccnpeople** takes the first reported value. In Wave 5, **raccnpeople** is based on SHARE derived variables which include imputations for missing values. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **raccfnpeople** is the imputation flag indicating whether the value of **raccnpeople** was imputed or not. A code of 1 indicates the value of **raccnpeople** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **raccnpeople** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed.

raccbath, **raccwaterc**, **raccwaterh**, **racctoilet**, and **raccheating** are variables indicating whether the respondent's accommodation had specific features when the respondent was age 10. These questions were asked during Waves 3 and 7. **raccbath** indicates whether the respondent's accommodation had a fixed bath when the respondent was age 10. **raccwaterc** indicates whether the respondent's accommodation had a cold running water supply when the respondent was age 10. **raccwaterh** indicates whether the respondent's accommodation had a hot running water supply when the respondent was age 10. **racctoilet** indicates whether the respondent's accommodation had an inside toilet when the respondent was age 10. **raccheating** indicates whether the respondent's accommodation had central heating when the respondent was age 10. **raccbath**,

racwaterc, **racwaterh**, **racctoilet**, and **raccheating** are assigned a code of 1 if the respondent reported their accommodation had the specific feature when they were age 10, and is assigned a 0 if the respondent reported not having the specific feature. These variables take the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked these questions. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

racbooks indicates the number of books in the respondent's accommodation when the respondent was age 10. This question was asked during Waves 3, 5, and 7. A code of 1 indicates that the respondent's accommodation had none or very few books (0-10 books). A code of 2 indicates that the respondent's accommodation had enough books to fill one shelf (11-25 books). A code of 3 indicates that the respondent's accommodation had enough books to fill one bookcase (26-100 books). A code of 4 indicates that the respondent's accommodation had enough books to fill two bookcases (101-200 books). A code of 5 indicates that the respondent's accommodation had enough books to fill more than two bookcases (more than 200 books). **racbooks** takes the first reported value. In Wave 5, **racbooks** is based on SHARE derived variables which include imputations for missing values. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **racfbbooks** is the imputation flag indicating whether the value of **racbooks** was imputed or not. A code of 1 indicates the value of **racbooks** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **racbooks** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed.

racmathperf indicates the relative performance of the respondent to others mathematically in school when the respondent was age 10. This question was asked during Waves 3, 5, and 7. A code of 1 indicates that the respondent was much better mathematically than average. A code of 2 indicates that the respondent was better mathematically than average. A code of 3 indicates that the respondent was about the same mathematically as average. A code of 4 indicates that the respondent was worse mathematically than average. A code of 5 indicates that the respondent was much worse mathematically than average. **racmathperf** takes the first reported value. In Wave 5, **racmathperf** is based on SHARE derived variables which include imputations for missing values. In Wave 5, **racmathperf** is assigned special missing (.i) if the value is missing because the respondent was in an institution at the time of the interview and SHARE did not ask this question to respondents living in institutions. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.q) is assigned if the respondent did not go to school. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **racfmthperf** is the imputation flag indicating whether the value of **racmathperf** was imputed or not. A code of 1 indicates the value of **racmathperf** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **racmathperf** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed. SHARE does not provide imputations of HO module variables for institutionalized respondents.

racclangperf indicates the relative performance of the respondent to others in the country's language in school when the respondent was age 10. This question was asked during Waves 3, 5, and 7. A code of 1 indicates that the respondent was much better in the country's language than average. A code of 2 indicates that the respondent was better in the country's language than average. A code of 3 indicates that the respondent was about the same in the country's language as average. A code of 4 indicates that the respondent was worse in the country's language than average. A code of 5 indicates that the respondent was much worse in the country's language than average. **racclangperf** takes the first reported value. In Wave 5, **racclangperf** is based on SHARE derived variables which include imputations for missing values. In Wave 5, **racclangperf** is assigned special missing (.i) if the value is missing because the respondent was in an institution at the time of the interview and SHARE did not ask this question to respondents living in institutions. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.q) is assigned if the respondent did not go to school. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **racflangperf** is the imputation flag indicating whether the value of **racclangperf** was imputed or not. A code of 1 indicates the value of **racclangperf** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **racclangperf** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed. SHARE does not provide imputations of HO module variables for institutionalized respondents.

Cross Wave Differences in SHARE

The number of rooms, the number of people, and number of books in the respondent's accommodation when the respondent was age 10 were only asked at Waves 3, 5, and 7. Relative educational performance in mathematics and language was only asked at Waves 3, 5, and 7. In Wave 5, SHARE provides imputed values for all five questions and these imputed values are incorporated into raccrooms, raccnpeople, raccbooks, raccmathperf, and racclangperf.

Questions about the features of the respondent's accommodations at age 10 are only asked as part of Waves 3 and 7.

SHARE Variables Used

Wave 3:

SL_CS002_	rooms when ten years old
SL_CS003_	number of people living in household when ten
SL_CS007D1	features of accommodation when ten: fixed bath
SL_CS007D2	features of accommodation when ten: cold running water s
SL_CS007D3	features of accommodation when ten: hot running water su
SL_CS007D4	features of accommodation when ten: inside toilet
SL_CS007D5	features of accommodation when ten: central heating
SL_CS007DNO	features of accommodation when ten: none of these
SL_CS008_	number of books when ten
SL_CS010A_	relative position to others when ten: language
SL_CS010_	relative position to others when ten: mathematically

Wave 5:

BOOK10	how many books at 10 years
BOOK10_F	how many books at 10 years - flag
LANG10	childhood language performance at 10 years
LANG10_F	childhood language performance at 10 years - flag
MATH10	childhood maths performance at 10 years
MATH10_F	childhood maths performance at 10 years - flag
PEOPLE10	people in childhood home at 10 years
PEOPLE10_F	people in childhood home at 10 years - flag
ROOM10	rooms in childhood home at 10 years
ROOM10_F	rooms in childhood home at 10 years - flag

Wave 7:

CC002_	rooms when ten years old
CC003_	number of people living in household when ten
CC007D1	features of accommodation when ten: fixed bath
CC007D2	features of accommodation when ten: cold running water s
CC007D3	features of accommodation when ten: hot running water su
CC007D4	features of accommodation when ten: inside toilet
CC007D5	features of accommodation when ten: central heating
CC007DNO	features of accommodation when ten: none of these
CC008_	number of books when ten
CC010A_	relative position to others when ten: language
CC010_	relative position to others when ten: mathematically

How Constructed

In order to provide a harmonized measure of education across all countries included in SHARE, the survey categorized education achievements using the 1997 International Standard Classification of Education ISCED-97 codes. For more information on ISCED codes, see [\(link\)](#) and the OECD document entitled "Classifying Educational Programmed: Manual for ISCED-97 Implementation in OECD Countries, 1999 Edition". Respondents were asked to report their parents' highest school degree or vocational training according to their country's educational system. SHARE then asked educational experts in each country to map local educational achievements to ISCED codes. For more information on ISCED codes see this [\(link\)](#).

ramomediscd and **radadediscd** indicate the level of education completed by the respondent's mother and father, respectively, according to ISCED codes. This question was asked during Waves 5, 6 and 8. **ramomediscd** and **radadediscd** are coded as follows: 0.None, 1.Primary education, 2.Lower secondary education, 3.Upper secondary education, 4.Post-secondary non-tertiary education, 5.First stage of tertiary education, 6.Second stage of tertiary education. **ramomediscd** and **radadediscd** take the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.o) is assigned if the respondent said that their mother or father obtained "other" education than the listed options. A special missing of (.s) is assigned if the mother or father is still in school. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

ramomeducel, **radadeducel**, **ramomeducl**, and **radadeducl** indicate the level of education completed by the respondent's mother and father, respectively, according to five-tier and three-tier harmonized scales which we developed to compare education levels across countries. These Harmonized education scales are simplified versions of 1997 International Standard Classification of Education (ISCED-97) codes. This question was asked during Waves 5, 6, 8, and 9. **ramomeducel** and **radadeducel** are coded as follows: 1.Less than primary education, 2.Primary education, 3.Lower secondary education, 4.Upper secondary & vocational training, 5.Tertiary education. **ramomeducl** and **radadeducl** are coded as follows: 1.Less than upper secondary education, 2.Upper secondary & vocational training, and 3.Tertiary education. Less than primary education is equivalent to no education. Less than upper secondary education is equivalent to less than primary education, primary education, and lower secondary education. Upper secondary and vocational training is equivalent to upper secondary and post-secondary non-tertiary education. Tertiary education

is equivalent to the first and second stage of tertiary education. **ramomeducel**, **radadeducel**, **ramomeducl**, and **radadeducl** take the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.o) is assigned if the respondent said that their mother or father obtained "other" education than the listed options. Special missing (.s) is assigned if the mother or father is still in school. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

ramaoccup_s is the 1988 International Standard Classification of Occupations (ISCO-88) major group code for the occupation of the respondent's household's main breadwinner when the respondent was age 10. This question was asked during Waves 3 and 7. In Wave 3, respondents were asked to identify the occupation of the respondent's household's main breadwinner when the respondent was age 10 by selecting from a list of 10 ISCO titles. A code of 11 indicates that the respondent's household had no main breadwinner. For more information about the ISCO-88 Codes used in Wave 3 see this [\(link\)](#). In Wave 7, respondents are asked to describe the occupation of the respondent's household's main breadwinner when the respondent was age 10. SHARE then used the current ISCO-88 to classify and aggregate occupational information. These ISCO-88 codes were then reclassified into the same major group codes asked in the Wave 3 question. **ramaoccup_s** takes the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.c) is assigned if the occupation code has not been coded by SHARE yet. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

ramomoccup and **radadoccup** indicate the respondent's mother's and father's occupation, respectively, when the respondent was age 10. This question was asked during Wave 6. A code of 1 is assigned if the occupation is categorized as white collar, which includes legislator, senior official, manager, professional, technician or associate professional. A code of 2 is assigned if the occupation is categorized as blue collar, which includes clerk, service, shop or market sales worker, skilled agricultural or fishery worker, craft or related trades worker, plant/machine operator, assembler or elementary occupation. A code of 4 is assigned if the occupation was categorized as other. **ramomoccup** and **radadoccup** take the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. A special missing (.h) is assigned if the respondent's mother or father was a homemaker when the respondent was age 10. A special missing (.l) is assigned if the respondent was part of the longitudinal questionnaire in Wave 6 and was not asked this question. A special missing (.n) is assigned if the respondent's mother or father was unemployed when the respondent was age 10. A special missing (.s) is assigned if the respondent's mother or father was permanently sick or disabled when the respondent was age 10. A special missing (.w) is assigned if the respondent's mother or father was retired when the respondent was age 10. Don't know, refused, or other missing responses are assigned special missing values (.d), (.r) or (.m), respectively.

Cross Wave Differences in SHARE

Questions about parental education were only asked during Waves 5, 6, 8, and 9 of SHARE.

The occupation of the main breadwinner when the respondent was age 10 is only asked as part of Waves 3 and 7. In Wave 3, SHARE surveys the occupation of the respondent's household's main breadwinner when the respondent was age 10 using showcards where the respondent identifies the occupation of their household's main breadwinner by selecting from a list of ISCO-88 titles. The respondent was asked "Please look at showcard [showcard #]. What best describes the occupation of the household's main breadwinner when you were 10?" The showcard contained the following list of job names/titles: "1. Legislator, senior official or manager, 2. Professional, 3. Technician or associate professional, 4. Clerk, 5. Service worker and shop and market sales worker, 6. Skilled agricultural or fishery worker, 7. Craft and related trades worker, 8. Plant and machine operator or assembler, 9. Elementary occupation, 10. Armed forces." In addition, a code of 11 indicates that the respondent's household had no main breadwinner. In Wave 7, the respondent was asked an open-ended question "What best describes the occupation of the household's main breadwinner when you were 10?" SHARE then used the current ISCO-88 to classify and aggregate occupational information. These ISCO-88 codes were then reclassified into the same major group codes asked in the Wave 3 question.

Questions about the mother's and father's occupation when the respondent was age 10 are only available in Waves 6 and 8.

SHARE Variables Used

Wave 3:
SL_CS009_ occupation of main breadwinner when ten

Wave 5:
ISCED1997_F father of respondent: isced-97 coding of education

How Constructed

rachshlt indicates the respondent's self-rated health status before the age of 16. This question was asked during Waves 3, 5, and 7. **rachshlt** is coded as follows: 1.excellent, 2.very good, 3.good, 4.fair, 5.poor, 6.health varied a great deal. **rachshlt** takes the first value reported. In Wave 5, **rachshlt** is based on SHARE derived variables which include imputations for missing values. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **rachfshlt** is the imputation flag indicating whether the value of **rachshlt** was imputed or not. A code of 1 indicates the value of **rachshlt** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **rachshlt** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed.

rachinfect indicates whether the respondent had an infectious disease (e.g. measles, rubella, chickenpox, mumps, tuberculosis, diphtheria, scarlet fever) before the age of 16. This question was asked during Waves 3, 5, and 7. **rachinfect** is coded as 1 if the respondent reported having an infectious disease before age 16, and 0 if the respondent reported not having an infectious disease before age 16. In Wave 5, tuberculosis was removed as an example of an infectious disease and was asked about separately as its own question. To provide a consistent variable across all waves, the responses from the specific question about tuberculosis at Wave 5 are included in **rachinfect**. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

rachpolio, **rachasthma**, **rachresp**, **rachallergy**, **rachdiarrhoea**, **rachmening**, **rachearpr**, **rachspeechimp**, **rachseeingdif**, **rachhdache**, **rachepilepsy**, **rachpsych**, **rachbones**, **rachappdcts**, **rachdiab**, **rachheart**, **rachleuk**, and **rachcancer** indicate whether the respondent had a specific condition before the age of 16. These questions were asked during Waves 3, 5, and 7. **rachpolio** indicates whether the respondent had polio before the age of 16. **rachasthma** indicates whether the respondent had asthma before the age of 16. **rachresp** indicates whether the respondent had respiratory problems other than asthma before the age of 16. **rachallergy** indicates whether the respondent had allergies (other than asthma) before the age of 16. **rachdiarrhoea** indicates whether the respondent had severe diarrhoea before the age of 16. **rachmening** indicates whether the respondent had meningitis/encephalitis before the age of 16. **rachearpr** indicates whether the respondent had chronic ear problems before the age of 16. **rachspeechimp** indicates whether the respondent had a speech impairment before the age of 16. **rachseeingdif** indicates whether the respondent had difficulty seeing even with eyeglasses before the age of 16. **rachhdache** indicates whether the respondent had severe headaches or migraines before the age of 16. **rachepilepsy** indicates whether the respondent had epilepsy, fits, or seizures before the age of 16. **rachpsych** indicates whether the respondent had an emotional, nervous, or psychiatric problem before the age of 16. **rachbones** indicates whether the respondent had broken bones or fractures before the age of 16. **rachappdcts** indicates whether the respondent had appendicitis before the age of 16. **rachdiab** indicates whether the respondent had diabetes or high blood sugar before the age of 16. **rachheart** indicates whether the respondent had heart trouble before the age of 16. **rachleuk** indicates whether the respondent had leukaemia or lymphoma before the age of 16. **rachcancer** indicates whether the respondent had cancer or a malignant tumour (excluding minor skin cancers) before the age of 16. These variables are coded as 1 if the respondent reported having the condition before age 16, and are coded as 0 if the respondent reported not having the

condition before age 16. These variables take the first reported value. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

rachtb indicates whether the respondent had tuberculosis before the age of 16. This question was asked during Wave 5. **rachtb** is coded as 1 if the respondent reported having tuberculosis before age 16, and 0 if the respondent reported not having tuberculosis before age 16. In Waves 3 and 7, tuberculosis was included as an example in the question that asked if the respondent had an infectious disease before the age of 16 (see **rachinfect**). These responses are not included in **rachtb**. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question or they were not eligible for the mini childhood module in Wave 5. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

rachrickets indicates whether the respondent had rickets, osteomalacia, or rachitis before the age of 16. This question was asked during Wave 7. **rachrickets** is coded as 1 if the respondent reported having rickets, osteomalacia, or rachitis before age 16, and 0 if the respondent reported not having these conditions before age 16. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively.

rachvaccine indicates whether respondent received any vaccinations before the respondent was age 16. This question was asked during Waves 3, 5, and 7. **rachvaccine** is coded as 1 if the respondent reported receiving any vaccinations before age 16, and 0 if the respondent reported not having received any vaccinations before age 16. **rachvaccine** takes the first value reported. In Wave 5, **rachvaccine** is based on SHARE derived variables which include imputations for missing values. A special missing value (.a) is used when the respondent did not participate in a wave that asked this question. Don't know, refuse, and other missing responses are set to (.d), (.r), and (.m), respectively. **rachfvaccine** is the imputation flag indicating whether the value of **rachvaccine** was imputed or not. A code of 1 indicates the value of **rachvaccine** was imputed. A code of 0 indicates the respondent provided a value when asked this question, so **rachvaccine** was not imputed. A code of -1 indicates the respondent was not asked this question or did not provide an answer during a wave in which the question was asked but missing values were not imputed.

Cross Wave Differences in SHARE

Self-rated health status during childhood and whether the respondent received any vaccinations during childhood are asked as part of Waves 3, 5, and 7.

In Wave 5, SHARE provides imputed values for both questions and these imputed values are incorporated into **rachshlt** and **rachvaccine**.

Questions about whether the respondent had specific medical conditions before the age of 16 are asked at Waves 3, 5, and 7. Whether the respondent had an infectious disease before the age of 16 was also asked at Waves 3, 5, and 7 but the language changed slightly during Wave 5. At Waves 3 and 7 the examples given for infectious diseases included measles, rubella, chickenpox, mumps, tuberculosis, diphtheria, scarlet fever. At Wave 5, tuberculosis was not included as an example. Instead Wave 5 included a separate question specifically about whether the respondent had tuberculosis before the age of 15. Due to these differences, we have created **rachtb** which captures any reports of tuberculosis at Wave 5, while **rachinfect** includes reports of any infectious diseases either from the general question about infectious diseases or from the specific question about tuberculosis at Wave 5.

Whether the respondent had rickets, osteomalacia, or rachitis before the age of 16 was only asked at Wave 7.

SHARE Variables Used

Wave 3:

SL_HC002_	vaccinations during childhood
SL_HS003_	childhood health status
SL_HS008D1	childhood illness 1: infectious disease
SL_HS008D10	childhood illness 1: difficulty seeing even with eyeglas
SL_HS008D2	childhood illness 1: polio
SL_HS008D3	childhood illness 1: asthma

SL_HS008D4	childhood illness 1: respiratory problems other than ast
SL_HS008D5	childhood illness 1: allergies (other than asthma)
SL_HS008D6	childhood illness 1: severe diarrhoea
SL_HS008D7	childhood illness 1: meningitis/encephalitis
SL_HS008D8	childhood illness 1: chronic ear problems
SL_HS008D9	childhood illness 1: speech impairment
SL_HS009D1	childhood illness 2: severe headaches or migraines
SL_HS009D2	childhood illness 2: epilepsy, fits or seizures
SL_HS009D3	childhood illness 2: emotional, nervous, or psychiatric
SL_HS009D4	childhood illness 2: broken bones, fractures
SL_HS009D5	childhood illness 2: appendicitis
SL_HS009D6	childhood illness 2: childhood diabetes or high blood su
SL_HS009D7	childhood illness 2: heart trouble
SL_HS009D8	childhood illness 2: leukaemia or lymphoma
SL_HS009D9	childhood illness 2: cancer or malignant tumour (excludi

Wave 5:

HEALTH15	childhood health at 15 years
HEALTH15_F	childhood health at 15 years - flag
MC012D1	disease during childhood: infectious disease
MC012D10	disease during childhood: difficulty seeing even with ey
MC012D11	disease during childhood: tuberculosis
MC012D2	disease during childhood: polio
MC012D3	disease during childhood: asthma
MC012D4	disease during childhood: respiratory problems other tha
MC012D5	disease during childhood: allergies
MC012D6	disease during childhood: severe diarrhoea
MC012D7	disease during childhood: meningitis/encephalitis
MC012D8	disease during childhood: chronic ear problems
MC012D9	disease during childhood: speech impairment
MC013D1	illnesses during childhood: severe headaches or migraine
MC013D2	illnesses during childhood: epilepsy, fits or seizures
MC013D3	illnesses during childhood: emotional, nervous, or psych
MC013D4	illnesses during childhood: broken bones, fractures
MC013D5	illnesses during childhood: appendicitis
MC013D6	illnesses during childhood: childhood diabetes or high b
MC013D7	illnesses during childhood: heart trouble
MC013D8	illnesses during childhood: leukaemia or lymphoma
MC013D9	illnesses during childhood: cancer or malignant tumour
MN031_	eligible for mini childhood module
VACC15	received vaccinations at 15 years
VACC15_F	received vaccinations at 15 years - flag

Wave 7:

HS003_	childhood health status
HS008D1	childhood illness 1: infectious disease
HS008D10	childhood illness 1: difficulty seeing even with eyeglas
HS008D2	childhood illness 1: polio
HS008D3	childhood illness 1: asthma
HS008D4	childhood illness 1: respiratory problems other than ast
HS008D5	childhood illness 1: allergies (other than asthma)
HS008D6	childhood illness 1: severe diarrhoea
